A Low-Cost Way to Sell Hardware and Software in Computerworld.

What is The Bulletin Board?

It's a classified section in Computerworld designed especially for the selling and buying of individual pieces of hardware in a convenient, low-cost format. It is especially suited to companies that have a piece of used equipment they want to sell. For one low price, you can inform more than half a million Computerworld readers around the country of your equipment's availability.

How Does The Bulletin Board Work?

Bulletin Board ads come in standard units (one column wide by one inch deep) and standard typefaces. (Units may be combined to produce deeper ads, but one column is the maximum width and no units of less than one inch are available.) Ads are arranged under headings (such as "IBM", "DEC" or "Printers"). The headline of the ad is set in larger, bold type, and should contain the standard equipment identification. The body copy should describe the equipment very briefly and give the person to contact. This is all the information an interested buyer needs to follow up. No ad should have more than one piece of equipment or software.

The price for each standard unit is only $130.00 (One unit minimum and no fractional units available.) Anyone can place an ad, but no agency commissions are paid, no quantity discounts allowed, and no credit toward rate is given for contract advertisers who advertise in other sections of Computerworld. It's a simple and effective system for buying and selling hardware and software.

How to Place an Ad in the Bulletin Board.

Ads are accepted in the mail, by phone or by telecopier. Ads can be accepted up until the Monday before issue (7 days in advance of issue date). You should write out your ad before submitting it. (The standard size will hold approximately 25 words of copy.)

Once you've written your ad, send it in with the coupon below or call one of our ad-takers. (If your company has never advertised with us before we request a check with your order.)

Remember that all ads are standard. No special typefaces, no borders and no logos are allowed. Ads are set on a six-column page in our classifed section under the heading "The Bulletin Board.". We assume no liability for errors beyond the price of the ad in the case of material errors.

ORDER FORM

COMPUTERWORLD BULLETIN BOARD

Issue Date: Ads can be accepted up until the Monday preceding the issue desired. Computerworld comes out every Monday.

Classifications: Most ads will be classified according to the brand of equipment that is being bought or sold. These classifications are: Altos, Burroughs, Control Data, Data General, Digital/DEC, Hewlett Packard, Honeywell, IBM, NCR, Selenaa, Sperry Univac, Teletype, Terminals, TI, WANG, Miscellaneous.

Copy: Copy for your ad must be clearly typewritten and may be sent in via the mail or by telecopier (telecopier extensions are 410 and 451). Ads may be given over the phone to our team of ad takers. The standard size is 1 column by 1 inch deep. These units may be combined to form larger sized ads. Describe the equipment very briefly, give the price and the name of the person to contact. All ads will be set up using a standard format. No borders or logos are allowed.

Cost: The price for each standard unit is $130.00 (One unit minimum and no fractional units allowed). There are no agency commissions and no quantity discounts.

Billing: Once you've written your ad, send (or call) it in with your name and address for billing purposes and we'll run it. (If your company has never advertised with us before, we request a check with your order.)

Transplant! The way to a stronger distribution system

If the heart of your distribution system skips a beat now and then, you may need an RMS/38 transplant. RMS/38 for the IBM/38 is a complete distribution operations and planning system that lets you better utilize warehouse inventory, provide current out-of-stock and short information to reps for better customer service, provide demand and shipment information for more efficient purchasing, anticipate credit problems rather than react to them.

RMS/38's nine powerful applications also allow financial management, generation of user reports with its query facility, and a PC link that lets you transfer information to your IBM Personal Computer for interaction with popular micro products. Plus advanced data base architecture which allows direct access to all stored information, making expansion simple and economical.

For a free demonstration or more information, contact PCR, Professional Computer Resources, 2421 Midwest Road, Oak Brook, IL 60521 (near Chicago). Also in New York, San Francisco, and Los Angeles.

15 pointed questions to ask MSA or any software supplier

These questions will help you when you sit down with individual software companies.

They're tough questions. Relevant ones. And any supplier who is worth his salt should be able to answer them without backpedaling.

Ask MSA

We'll answer all these questions to your satisfaction—plus any others you may have.

In fact, we're probably the best equipped to answer them. Because MSA is the software company. We offer the most complete line of totally integrated systems in the software industry, including financial, human resource and manufacturing.

So you avoid the headache of trying to tie together individual systems. (And the even bigger headache of adding to them.)

With MSA's integrated systems, there's no unnecessary duplication of data or effort. Reporting is faster. All your company's information is more timely and accurate—and in the right form.

Our technical edge comes from experience

Staying ahead is easier for a company that's steeped in software technology. MSA has spent years developing, refining, testing and enhancing our systems.

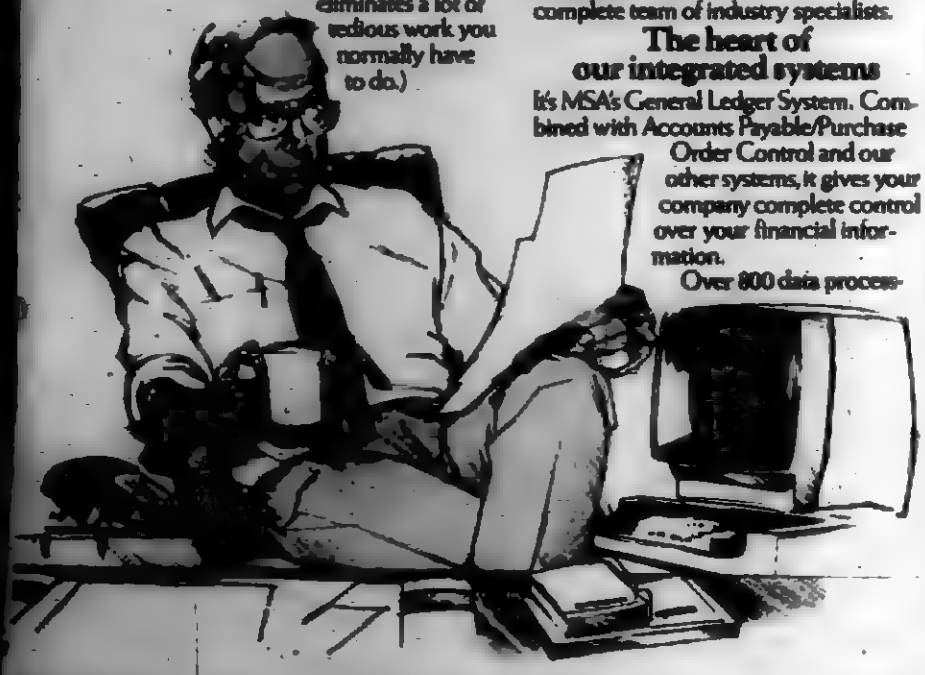
This year alone, we'll invest $25 million to make sure all our systems are technologically razor sharp. That gives us a decided advantage over flash-in-the-pan technology that may not have the bug-free logic of a more experienced system.

It also gives you a decided advantage over "custom" systems you have to update yourself.

MSA relieves you of that time-consuming burden. We update and enhance your software for a full year. Then we continue this service for a surprisingly low annual fee.

Maintenance includes keeping your system up-to-date technologically. Enhancing it with new features that make it work even harder for you.

And making sure it reflects changes in accounting procedures and government regulations, including 401(k), TEFRA, and FAS52. (That eliminates a lot of tedious work you normally have to do.)



Save this box. It can help you make an intelligent software decision.

1. Can you offer us a complete range of software systems designed to work together?
Or will we have to piece together a patchwork of systems?

2. Are your systems just record keepers, or can they really help us make decisions?
Can we pull together information from any of our integrated systems? In exactly the form we want it?

3. Can you provide business software for both mainframe and microcomputers?
Do you develop this software yourself or do you simply market it for another company?

4. Are your systems truly online so all of our information is current?
How many of your systems are online? How secure are they?

5. Will my company have to be the one that discovers the bugs in your brand new system?
Just how long have your systems actually been used, and how have they been tested?

6. Will you update your systems as technology advances and regulations change?
What are some of your most recent updates? Will you keep us current on regulatory changes?

7. Do your systems really do everything you say they will?
Or will we have to change them or add to them to get the features we want?

8. How long have you been in business?
What are your revenues? What is your growth record? Where will your company be five years from now?

9. How many systems has your company installed?
How many of these were installed in the past six months? How many of your earlier customers are still using —and liking—your systems?

10. Do your financial systems handle unlimited foreign currencies?
Do your financial systems use a common set of currency exchange rates?

11. Can you link our executives' computers directly to the mainframe—so they can get their own information?
Is that software available right now?

12. How will you make sure our own people thoroughly understand your system?
Do you have educational centers near us, or will we have to travel all the way across the country to find one? Will you be there to help during installation and after?

13. How many of your people specialize in software for my industry?
How many accountants work for you? Human resource specialists? Manufacturing experts?

14. Do your systems have built-in features that make them easier to use?
What happens if someone needs help figuring out a feature? Do you have online documentation that's easy to understand?

15. As my business changes will your system be flexible enough to change with it?
Or will we have to pay a lot to revamp it? Or even regenerate it?

35,000 days of training

At MSA, we make sure your people have a firm grasp of our systems. Last year alone, we conducted more than 35,000 student days of customer training for over 1,800 companies. At education centers all over the world, as well as at our headquarters.

From training sessions to cassettes to complete, easy-to-understand documentation, MSA provides the most extensive Customer Education Programs in the industry.

And MSA systems are just as friendly as our people. Our online HELP feature actually guides users through our systems, and EASY-SCREEN™ lets them design their own screens without creating data processing nightmares.

If there's ever a question or problem with our systems, MSA customers are always close to service.

Our Account Managers are knowledgeable, responsive, and backed by a complete team of industry specialists.

The heart of our integrated systems

It's MSA's General Ledger System. Combined with Accounts Payable/Purchase Order Control and our other systems, it gives your company complete control over your financial information.

Over 800 data processing specialists, accountants, and financial experts work together to make MSA's financial systems the most advanced and most highly integrated in the industry.

MSA has the answers

Whatever your size—whatever your business—MSA has a total software solution.

We'll provide the highest quality integrated online software.

We'll tie your business and manufacturing software systems together, using our exclusive Extended Closed Loop™ manufacturing system.

We'll provide business software for your microcomputers, through our Peachtree Software Company.

We'll even link your microcomputers to your company's mainframe—with MSA's Executive Peachpak™ application software. A revolutionary concept that lets executives get the mainframe information they need through their personal computers.

MSA ready-to-install application software

CDLA to urge tax changes

Financial benefits in offing for users, lessors?

By John Kirchner
CW Washington Bureau

WASHINGTON, D.C. — The Computer Dealers and Lessors Association is readying a well-financed lobbying blitz to seek tax law amendments that could mean millions of dollars of benefits for computer users.

The object of the campaign is to get the U.S. Congress to place computer equipment in a three-year, accelerated cost-recovery system depreciation category. This would allow those who sell, lease or use computers to obtain the full extent of investment tax credits and depreciation benefits during the useful life of the machine, which, CDLA argued, is closer to three years than five years, as suggested in existing law.

The 1981 Economic Recovery Tax Act placed computer equipment in the five-year depreciation category with a 10% investment tax credit. CDLA Executive Director James F. Benton said government revenue losses caused by a shorter depreciation schedule would be offset by reducing the tax credit to 6%, as the association proposed. This would put it in an existing category that includes light-duty cars and trucks, certain research equipment and other short-lived machinery.

The benefits of the proposed change would

Unix, C language seen hot tickets to success in DP job market

By John Gallant
CW Staff

WALTHAM, Mass. — If you are a software design engineer with three to five years of experience with Unix operating systems or the C language, you may be able to write your own ticket to success.

That was the consensus among software manufacturers represented at the Softfair '84 job fair held here last week. Among the 29 local companies seeking applicants at Softfair, at least 22 were looking for software design or development engineers. Thirteen companies advertised for software personnel with a Unix or C background, and many others interviewed by *Computerworld* said that such experience would be useful for a candidate.

Touted by its promoters as the nation's first job fair solely for software professionals, the two-day event gave programmers, analysts, designers and software support specialists an opportunity to slip out of work early and meet with recruiters from a variety of high-tech firms. The number of job openings offered by the companies at Softfair

Teenage burglars play swap 'em with stolen micros

By James Connolly
CW Staff

ATLANTA — Burglarizing businesses and swapping $10,000 computers like baseball cards, a gang of "basically good kids" amassed a $250,000 collection of stolen microcomputers, according to police.

The gang, with a half-dozen teenage participants involved at various levels, allegedly broke into 30 businesses within five months, selectively taking computers, modems, expansion cards and software, apparently for their own use.

DeKalb County Police investigator Randy Fitch, a personal computer user himself, pursued the thieves for five months and broke the case in February on a tip that IBM operator manuals had been stored in an apartment complex.

According to Fitch, the 15- and 16-year-old thieves were of average intelligence — "not geniuses" — and were interested in computers and electronics. He said they initially stole out of curiosity and accumulated equipment that they traded "the way kids traded baseball cards 30 years ago.

"It was a case of 'wants' problems — people who wanted something and couldn't afford it, so they just took it. One

kid in particular found a way to break into businesses, a certain flaw in the way big office complexes were built. He and a couple of others started going in to look around. But all of that stuff was there, and they just started taking it. They said they had become interested when they took computer science courses in school," Fitch said.

The youths took not only computers, but also medical equipment such as stethoscopes and optical lenses. They almost always stole software, sometimes leaving businesses with no corporate records. One confessed to Fitch that they knew their stolen goods were worthless without software. In one case, they allegedly stole eight Apple Computer, Inc. Lisa systems, valued, with software and peripherals, at $126,000.

The youthful burglars were selective. "They gained entry to at least one computer equipment store, and rather than take the equipment that was for sale, they took the operating equipment and software. Sometimes they didn't even take the whole computer. They would take an IBM [Personal Computer] XT apart because they wanted the modem card out of the expansion board," Fitch reported.

One allegedly stripped the hard disk drive out of one Personal Computer XT and added it to a second XT. "That gave him 20M bytes. I asked him how long he figured it would have taken him to fill it, and he said he had just scratched the surface and that it would take him 30 years," added Fitch, who said he and his wife use an IBM Personal Computer in their home.

Sting foils $1 million chip plot

By Robert Batt
CW West Coast Bureau

LOS ANGELES — In what is believed to be the biggest-ever sting operation of its kind in Southern California, two businessmen were arrested here last week and charged with illegally attempting to buy $1 million worth of semiconductor parts.

The two men, Benzion Blumenfield and Nahum Sahar, were arrested after a three-month undercover operation conducted by Silicon Valley chip manufacturer Signetics Corp. and local detectives. They are due to appear in court here Wednesday, charged with receiving stolen property.

Sahar, who owns a company called Aero Distributors in Beverly Hills, is accused of attempting to pay $300,000 for chips he believed to be stolen.

Blumenfield, although not directly participating in last week's transaction, is alleged to have been involved in four previous illegal transactions valued at $40,000.

According to Bruce Radetich, chief corporate investigator for Signetics, the company first became aware of Blumenfield, owner of a Woodland Hills, Calif.-based firm called Bentronics, when he tried to solicit random-access memory and read-only memory chips worth hundreds of thousands of dollars from the firm's subsidiary in Bangkok, Thailand.

Suspicion confirmed

"Our plant manager in Bangkok was very suspicious of this inquiry, so, posing as another company, we brought in an undercover officer and arranged to meet Blumenfield in Los Angeles. It was there that he introduced us to Sahar, who turned out to be the big money man, and we did a couple of deals with them in which we sold them purportedly stolen products," Radetich claimed. None of the chips were in fact stolen, he added.

Signetics said the sting operation was revealed when Sahar paid a $150,000 deposit for $1 million worth of 74 LS series chips, a popular chip design made by Signetics and other chip manufacturers. The chips are in short supply at the moment and were expected to bring an inflated price on what has become known as the "gray market" — the twilight zone between legal and illegal trafficking in chips.

Under the terms of the alleged deal, Sahar was to pay the remaining $150,000 shortly after receiving the parts. He was instead arrested by a Los Angeles detective as soon as he took possession of the parts.

"While we have been involved in similar sting operations in the past, this is the first time we have taken part in an operation in which this much money was involved," commented Jerry Good, a detective at the West Valley division of the Los Angeles Police Department.

The successful sting is the fourth such operation involving Signetics in the last 18 months.

Social Security DP official charged with extortion

By Patricia Keefe
CW Staff

BALTIMORE — A ranking government DP official was arrested here late last month and charged with attempted extortion of more than $400,000 for fixing a subcontract.

Kenneth M. Barry, director of the Social Security Administration's (SSA) Software Technology Center in Woodlawn, Md., was arrested by Federal Bureau of Investigation agents. The attempts to bribe a Los Angeles software firm allegedly took place from April 1981 to April 1982, when Barry was director of the SSA's Office of Data Communications.

The subcontract Barry allegedly tried to fix was related to a larger contract held by Paradyne Corp., against which the Securities and Exchange Commission (SEC) has a pending fraud suit.

Federal prosecutors in Los Angeles are expected to seek an indictment against Barry, who was released on a $50,000 personal recognizance bond. If convicted, he faces a maximum sentence of 20 years and a $10,000 fine. An SSA spokesman said Barry is on "administrative leave with pay" pending the outcome of the case, but declined to comment further. Attempts to reach Barry's attorney were unsuccessful.

An affidavit by FBI agent Jonathan Hersley attributed remarks to Barry that implied he may have helped to influence the award of the $100 million hardware contract to Paradyne in 1982. That contract award has spawned numerous protests from competitors, two pending court suits, a congressional inquiry and an investigation by the Department of Health and Human Services (CW, April 4, April 11 and April 25, 1983).

Michael Wolansky, an SEC attorney, said the SEC had previously taken depositions from Barry and may recall him for further testimony in light of Hersley's statement. Hersley claimed that Barry met in Florida with a principal of Engineering & Contract Labor International (E&CLI) — the Los Angeles software vendor — and John Applegate, a former Paradyne vice-president overseeing the SSA contract.

Hersley also alleged that Barry encouraged a joint venture between Alfred Leung, a consultant to Paradyne and a former SSA employee, and E&CLI for the purpose of handling the software subcontract, which he promised to secure from Paradyne after arranging for Paradyne to obtain the $4 million base contract.

The affidavit also alleged that Barry told E&CLI officials that he planned to leave the SSA and wanted them to provide funds to "stake him" in a new company.

Barry also provided E&CLI principals with in-house SSA documents that they weren't entitled to, according to Hersley.

Two accused of soliciting bribes from software development firm

By John Gallant
CW Staff

BALTIMORE — Federal officials are seeking indictments against a Defense Department employee and a New York City oil company executive who were arrested last week and charged with soliciting nearly $645,000 in bribes from a Boston software developer.

Edward D. Thomas, an employee in the Defense Department's Tri-Military Information Systems (Trimis) office, and A. Walton Hill, an executive with an unnamed oil company, were arrested Feb. 25 in Bethesda, Md., by Federal Bureau of Investigation agents posing as representatives of Intersystems Corp. of Boston.

According to FBI spokesman Andrew Manning, Thomas and Hill are accused of soliciting payments from Intersystems in exchange for inside information about a $44.5 million military contract. Manning said Thomas approached Intersystems in November and offered to supply information that would help the firm in bidding to supply software to be used in a computerized health care system for the Defense Department.

Manning said that Intersystems' attorneys immediately contacted the U.S. attorney's office in Boston, which subsequently turned the investigation over to the FBI here. It was not until Feb. 16, however, that an FBI agent posing as an Intersystems employee first met with Thomas at a Bethesda restaurant. At that time Thomas allegedly promised to supply all information necessary for Intersystems to win the contract and told the agent to work out payment details with Hill in New York.

During three-way telephone conference calls with the undercover agent on Feb. 21 and 22, Hill and Thomas proposed a series of four cash payments totaling $200,000, plus an additional payment of 1% of all or whatever portion of the contract Intersystems was awarded. A meeting on Feb. 25 was also arranged, at which the first $50,000 payment was to be made.

On that date, according to Manning, Hill arrived in Bethesda and was transported by Thomas to a Holiday Inn where the meeting took place. After Hill accepted the cash payment from the undercover agent, other FBI investigators rushed into the hotel room and arrested him. A short time later, Thomas was arrested at a gas station a few blocks from the Holiday Inn.

Manning said Thomas was charged with violating a federal antibribery statute, and Hill was charged with aiding and abetting a bribe.

Both men were held until last Monday when they appeared before a federal magistrate in Hyattsville, Md. The two were released on $25,000 bond.

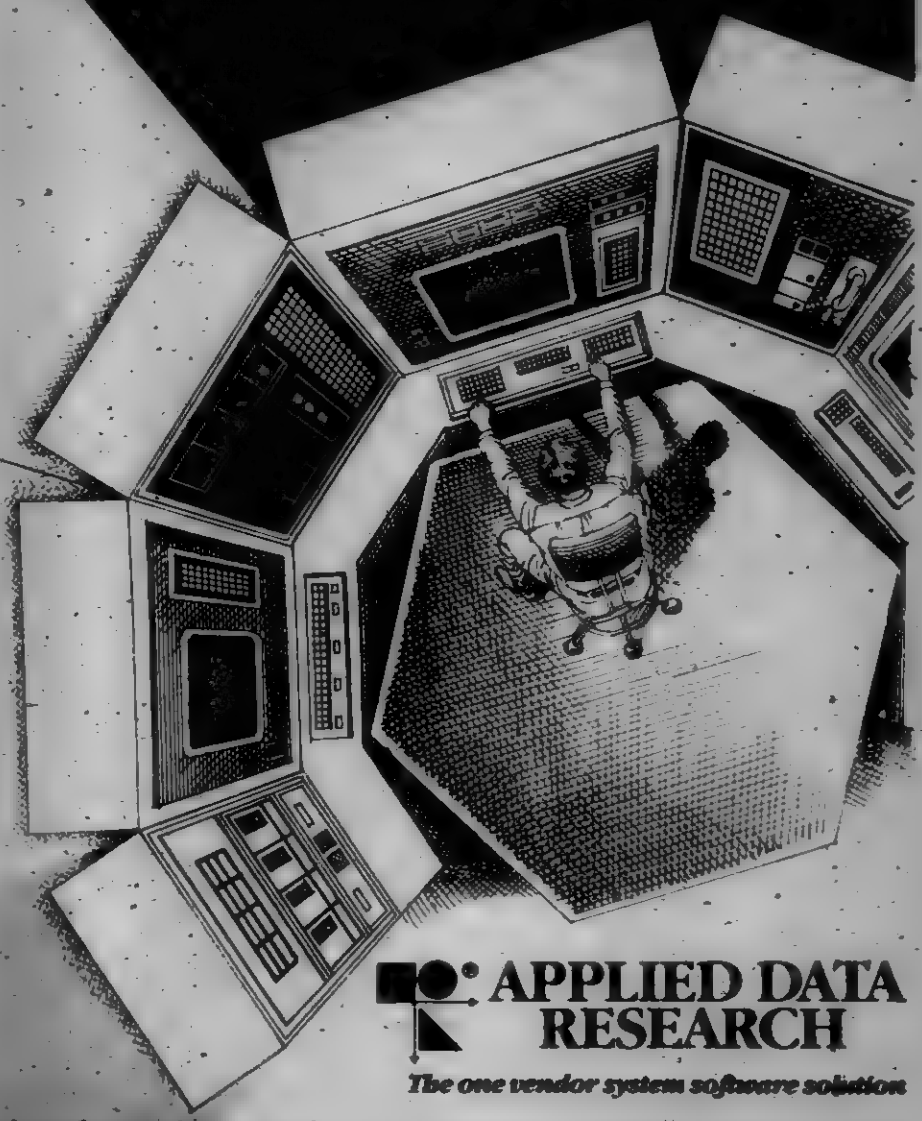
ADR/IDEAL
puts you in command of the application backlog

IDEAL is the one system with *everything* you need to break the application backlog. IDEAL, under one interactive workstation environment, combines a relational DBMS, an active data dictionary and a fourth-generation language with facilities for managing the entire application lifecycle.

IDEAL is *the* standard in fourth-generation application development systems. Of course, other systems have subsets of these facilities. But why should you settle for anything less than IDEAL?

IDEAL SOLVES THESE PROBLEMS

- Large-Scale Applications
- Production Applications
- Departmental Applications
- Application Enhancements
- Online Retrieval
- Online Transaction Processing
- Dialog Management
- Batch Reporting
- Complex Updates
- Design
- Coding
- Testing & Implementation
- Documentation
- Project Management



IDEAL DELIVERS THESE FACILITIES

- Panel Definition
- Report Definition
- Procedure Definition
- Application Definition
- Data Definition
- Intelligent Editors
- Split Screen
- Online Help
- Menus
- Commands
- Online Checkout, Compilation, Execution
- Printing Services

IDEAL COMBINES THESE TECHNOLOGIES

- Relational DBMS
- Non-Procedural Languages
- Active Data Dictionary
- Library Management
- Structured Design & Development
- Advanced Interactive Environments

IBM X models disappoint 3080 series users

By Tom Henkel
CW Staff

Users of IBM 3083 and 3081 processors were disappointed but not surprised by IBM's recent announcement of 3080 X model processors, DP managers polled by *Computerworld* last week revealed.

IBM announced last month that six new X models of the 3080 series will replace current models in the line [CW, Feb. 26]. For the same price as existing models, the processors offer 5% to 14% greater internal throughput. Users of existing models, however, cannot field-upgrade to the newer processors.

While industry analysts were calling the IBM announcement a slick marketing move aimed at squashing a potentially fertile market for used 3080 series processors, users contacted seemed to accept the possibility that their processors will now have a lower-than-expected resale value. All agreed their chief complaint about the announcement was the lack of field-upgradability from the older 3080 systems to the X models.

Contending processor life cycles are growing much shorter, almost to the point where mainframes have become disposable business items, Harold Colby, senior vice-president of DP at Boston's John Hancock Mutual Life Insurance Co., said he never expected his one 3083 and five 3081 processors would have much resale value by the time the insurance company decides to replace them. Colby said the 3080 series X models fit into a general trend in the processor marketplace, where systems rarely outlive their first owners' processing requirements. Rapid-fire technological advances often make processors obsolete in under three or four years, he added.

Could have been worse

The lack of field-upgradability from the older 3080 series processors was a disappointment for Colby. However, being forced into making a processor swap does not present as big a problem as migrating to another operating system would, he added. Things could have been worse, he said, if IBM had changed the ground rules on its systems software.

The manager of technology at another large user site, the Information and Computer Services Division of Shell Oil Co. in Houston, echoed Colby's feelings. Emphasizing that Shell does not particularly enjoy it when IBM announces new products that make their current hardware obsolete, Merle Bone said such a turn of events is a possibility users must take into consideration — especially if they are using the biggest and newest processors IBM is offering.

"We would have preferred it to be a retrofit," Bone said. But he equated the X model announcement with IBM's cutting hardware prices six months after a firm purchases a system. In the case of the price reduction, no one would expect IBM to refund the user's money. Likewise, if IBM offers a faster version of its current processor lineup at the same price as a previous version, users cannot realistically expect IBM to refund current users' money.

But a smaller user, John H. Porter, director of the Academic Computing Center at Boston University, was not as understanding as Colby and Bone. He felt IBM deceived him.

When Porter was considering a 3081 processor, he flatly asked IBM if the processor would be field-upgradable to newer models. At the time, he said, IBM answered in the affirmative. Now IBM appears to have changed its mind, he said.

"How many times can IBM do this in the period of a decade without losing all credibility?" Porter asked. He noted that users of IBM 370/155 and 165 processors were placed in a similar situation several years ago.

According to Porter, the amount of impact the IBM X models' introduction will have on his operation will depend on how easy it will be to migrate from the older 3080 processors to IBM's next line of processors, sometimes called the Sierra line.

Some industry watchers speculate that the newer 3080 X models may be field-upgradable to the yet-to-be-unveiled Sierra processor line. If that turns out to be the case, Porter said, he will be very upset.

"I couldn't care less about the X models," Porter said, explaining that since his DP requirements are growing at an annual rate of about 25%, the moderate performance increases offered by the X models would not help much.

In contrast, users like Brian Scott, president of Banks of Iowa Computer Services, Inc., felt they had won in the IBM processor game. Scott noted that his firm was one of the first to receive a 3081 processor two years ago. That means the firm has already had a fair amount of use from the processor. Other users who were leasing 3080 series processors said they were glad they chose to lease rather than purchase the machines.

Third-party lessors downplay X series' impact on residual values

While there is general agreement that IBM's new X model 3080 series processors will hurt residual values of installed 3080s, third-party lessors dealing in IBM hardware last week said they did not feel the impact would be significant.

Gerald L. Minsky, president of Technology Finance Group, Inc. of Westport, Conn., noted that third-party leasing firms with 3080 systems already out on lease will probably not be hard hit by the X model announcement. Lessors that will have problems, Minsky said, are those who have 3080 series processors that have yet to be leased to an end user.

Minsky explained that most third-party leasing firms anticipated a very low residual value on 3080 series processors.

Therefore, he claimed, the X model announcement may not have a devastating impact on leasing firms.

The big question, Minsky said, is what sort of migration path IBM will provide to its anticipated next series of large processors, sometimes called the Sierra line.

If IBM offers current users of 3080 series processors a bridge to the Sierra line, the residual values of currently installed systems may not be seriously affected, he continued.

In fact, if there is a bridge to the Sierra, Minsky said the older 3080s will suddenly become good buys. But if the X model processors are field upgradable to the Sierra line, which is what some industry watchers expect, older 3080 series processors will be very hard to lease or sell, according to Minsky.

But Richard Forsythe, president and chief executive officer of the Chicago-based Forsythe/McArthur Associates, Inc., believes even if the newer X models are field-upgradable to the Sierra line, there will still be a market for the older 3080s.

As an example, Forsythe noted that the IBM 3033 series processor is still selling, even though the IBM 3033 line has been outdated for about two years.

Forsythe explained that not every user is eager to migrate to the latest processor available from IBM. Further, he said not every IBM user is making a hurry-up effort to migrate to IBM's MVS/XA operating system.

"I'm glad I don't have any," Svend Hartman, president of Computer Merchants, Inc. of Chappaqua, N.Y., said of the older 3080 machines.

Hartman, who deals in smaller systems, explained it will be difficult to sell or lease an older 3080 series processor until IBM resolves the questions surrounding the migration path to the Sierra line.

Group announces test results of micro interfaces with B6800s

LONG BEACH, Calif. — Michael Stahura and Associates, Inc. has made available the results of the Microcomputer Common Interest Group (Micro CIG) Initial Microcomputer Test completed here recently.

The test addressed the interface of several microcomputer systems with a Burroughs Corp. B6800 mainframe at B.J. Hughes Corp. in Houston.

The performance of each microcomputer — an Apple Computer, Inc. Apple IIe; Burroughs ET 2130; ECS Microsystems, Inc. ECS 4500; IBM Personal Computer; Televideo, Inc. TS802H; Victor Technologies, Inc. Victor 9000; and Xerox Corp. 820-II — was examined in the areas of hardware interfaces with the mainframe, terminal emulation mode capabilities, switching from micro mode to system mode, terminal control functions and file transfer capabilities.

Micro CIG, part of the Cooperating Users of Burroughs Equipment, which is listed as the official users group for Burroughs Corp. computing equipment, is responsible for collecting, coordinating and disseminating information on microcomputer interfaces with Burroughs mainframes.

The Initial Microcomputer Test results are available for $5 postage and handling from Michael Stahura and Associates, located at 500 Havana Ave., Long Beach, Calif. 90814.

Second-class postage paid at Framingham, Mass., and additional mailing offices. *Computerworld* (ISSN-0010-4841) is published weekly, except: January (5 issues), February (5 issues), March (5 issues), April (7 issues), May (5 issues), June (5 issues), July (5 issues), August (5 issues), September (5 issues), October (5 issues), November (5 issues), and a single combined issue for the last week in December and the first week in January by CW Communications/ Inc., Box 880, 375 Cochituate Road, Framingham, Mass. 01701.

Victim of Honeywell fraud to claim damages

NEW YORK — Already judged a victim of fraud at the hands of Honeywell, Inc., a computer user will return to federal court soon to claim damages of up to $1 million.

In addition to providing William M. Selden, former owner of a New York service bureau, with yet-to-be-determined compensation, the verdict may help other users to win suits against vendors whose sales pitches misrepresent their products, according to the victor's attorney.

Selden recently won a civil suit in which he charged that Honeywell officials defrauded him and his company, Accusystems, Inc., in 1978 when they told him the Honeywell Level 6 minicomputer with TL-6 utility software would allow him to run up to 32 terminals and multiple tasks.

But, according to Selden, the software never performed as Honeywell claimed, failing to support more than three users even when he bought more memory on Honeywell's advice, and that failure drove him out of business. He sold his payroll and accounting services business and his family farm to pay his debts and moved to Los Angeles, where he now works as a consultant.

Selden had sought $9 million in actual and punitive damages in his 1980 suit [CW, Oct. 27, 1980]. Last month, U.S. District Court Senior Judge Dudley B. Bonsal found that Honeywell had defrauded Selden, but he dismissed most of Selden's damage claims. Bonsal is expected to hold a new hearing in late spring to determine Selden's losses.

Bonsal ruled in favor of Honeywell on Selden's claim that Honeywell was negligent in servicing the system. But of the fraud allegation, the judge said, "The representations made by Honeywell to plaintiffs prior to the agreement [purchase contract] were known by Honeywell to be false or made recklessly without knowing whether they were true or false, in order to induce plaintiffs to enter into the agreement. . . . The representations that the TL-6 operating system had been extensively tested and could concurrently perform multiple tasks for multiple users were representations of fact and not merely promises of future action or statements of intent."

The judge declined to award damages at the time of his verdict, noting that Accusystems failed to mitigate its damages when it became apparent in May of 1979 that the TL-6 system would not work right. He said Accusystems can collect for damages suffered only between February 1978, when Selden bought the system, and May 1979. He also refused to assess Honeywell for Selden's lost profits or for punitive damages.

Selden, who claimed to be one of about 40 dissatisfied TL-6 users, said, "I would be looking for something in the neighborhood of $1 million." He said that two other TL-6 users settled suits against Honeywell for undisclosed sums and that others settled out of court. However, Selden's attorney, Thomas K. Christo, noted, "I think we are probably in the $500,000 to $800,000 range."

Honeywell's attorney, James D. Liss, offered a still lower estimate of damages. "We believe the award in the case will be under $250,000," according to Liss.

Liss also foresaw no long-term impact from the case, saying that the judge's ruling "ignores the contract" and relates only to misrepresentations made before the signing of the standard contract. That contract limited Honeywell's liability to repair or exchange defective equipment.

'Psychological' impacts

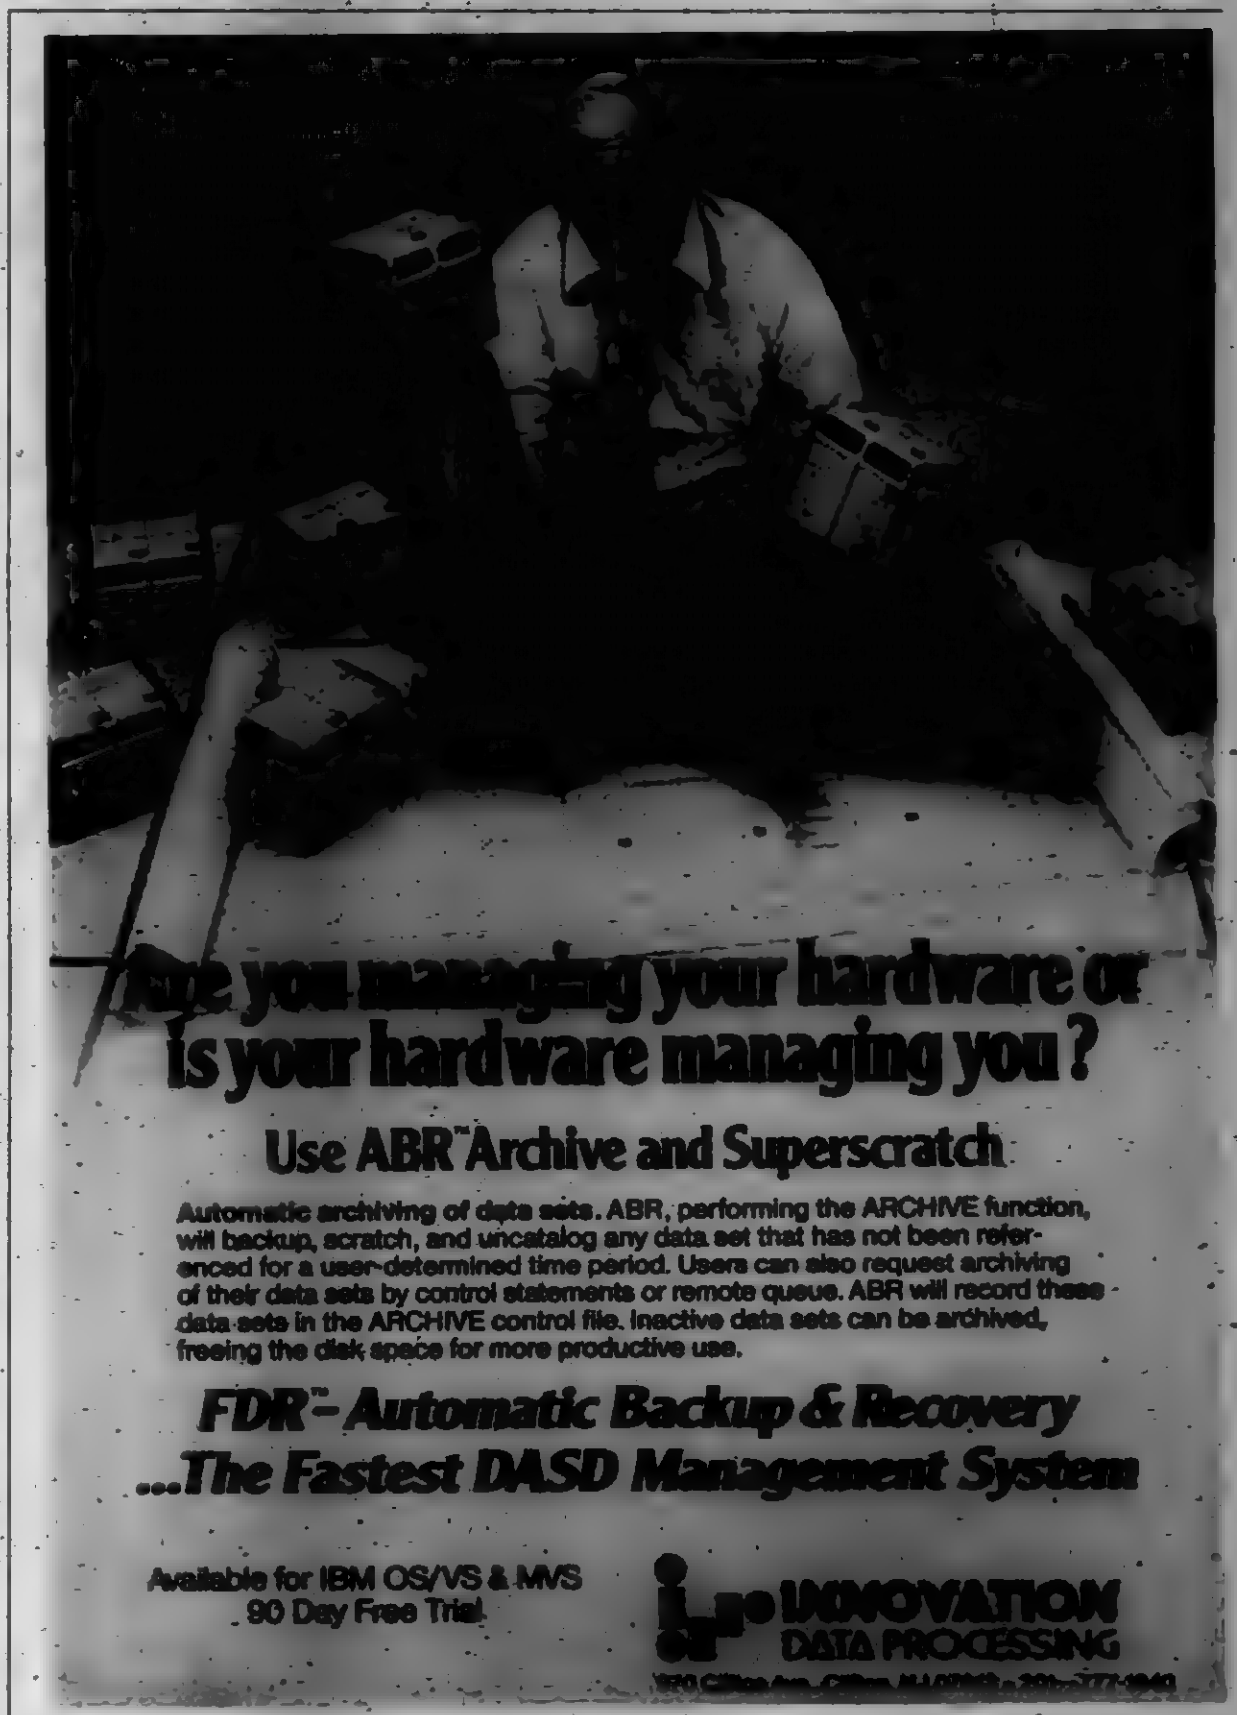
But Christo predicted three, at least "psychological," impacts from the ruling. "It means that if somebody lies about what a given product can do, they can be held liable for fraud, no matter what the contract says," he said. He also cited the import of Honeywell's unsuccessful bid to show that Selden, a former systems analyst for IBM and a member of the team that developed Cobol, was knowledgeable about computers and shouldn't have relied on the sales force's statements. He said the verdict could keep other vendors from relying on the theory of caveat emptor (let the buyer beware).

The third point cited by Christo was that Selden's win came in a jury-waived trial, where the losing vendor couldn't complain about a user's emotional appeal swaying unsophisticated jurors.

Attorneys for both sides said decisions would be made later on whether to appeal the portions of the case which they lost.

Selden ordered six Level-6 computers when he started his business in 1977, but received only one. He paid Honeywell about $40,000 for his system.

The Level 6 and the MOD-200 operating system with the TL-6 option, installed in about 100 locations, are still available, but only on an "as available basis," according to a Honeywell spokesman. The spokesman declined comment on the case because it remains active in the courts.



Job fair seen one of many recruiting tools

WALTHAM, Mass. — The job fair is only another weapon in the battle to attract high-quality software specialists, according to recruiters at Softfair '84.

"I think it's a good idea," said Ron Koloski, employment specialist for Canton, Mass.-based Codex Corp. "The job fair draws together a pool of qualified people. But you can't rely on it totally; it's only one tool among many."

Other representatives of the high-tech companies attending Softfair had mixed feelings about the effectiveness of job fairs in recruiting software professionals. "I have found that a lot of the people attending are entry-level candidates. Experience is rare, and people who have it are tough to find. But I think this is an excellent idea. It brings together a lot of good prospects in one central location," said Richard Bielefeld, technical support manager for McCormack & Dodge Corp. in Natick, Mass.

"We get a lot of resumes, and most aren't of any interest to us," said R. Kent Blackett, software development manager for Masscomp of Westford, Mass.

"There is a lot of paper on the market that doesn't fit our needs. But overall, our experience with this sort of thing is positive. If we can find even one or two good people, it beats paying finders' fees to an employment agency."

The outlook was not much different on the other side of the booths. "This is great for people with lots of experience," according to one entry-level applicant looking for an opening in technical software support. "But all the resumes go into one big pile, and that won't help me any when the recruiters review them later."

"I don't have an electrical engineering or a computer science degree, so I'm not sure I'm in demand here," another hopeful with programming experience said. "But this is a good way to approach a company. If you can make a personal contact, it beats just sending a letter."

JOBS from page 1

ranged from as many as 300 to as few as three.

Recruiters said they were looking for candidates with an average of three to five years in the industry, although openings in such areas as documentation and entry-level programming were also available to applicants with less experience. Applicants with backgrounds in most programming languages and major operating systems were in demand, but the emphasis was clearly on Unix and C specialists.

"We're especially interested in finding candidates who have at least three years of experience in C. It's important to us because we're a multisystem software manufacturer. Our products run on a variety of processors, and C is a very portable language," said Edward McHugh, director of software engineering for Interlan, Inc. Based in Westford, Mass., Interlan designs and manufactures local-area network systems.

Gregory Denaro, senior employment representative for Bunker Ramo Information Systems in Trumbull, Conn., was also in the market for Unix experience. "Unix is going to be hot in the next few years, and it's hard to find qualified candidates. A lot of them are overpriced, which means that you're going to have to spend lots of money to get them. Software development engineers are big, too; you can judge that just by the number of positions available."

According to Ron Koloski, employment specialist for Canton, Mass.-based Codex Corp., opportunities are wide open for C programmers and Unix specialists. "The market is extremely good, and people seem more secure in seeking out these opportunities. They're not sitting around trying to hang on to what they have. The economy is booming, and people are moving."

While traditional programmer and programmer/analyst jobs were not in abundance at Softfair, there were many openings for graphics and communications software professionals. "It's never easy to find data communications people," Koloski said.

"The market for communications specialists is pretty tight right now," McHugh said. "We've had some success finding qualified applicants here, but we're looking for skills that are pretty hard to find."

C language, Unix get nod over Cobol

WALTHAM, Mass. — Applicants at last week's Softfair '84 job fair here agreed with employers on site that skills in the Unix operating system and the C language are highly marketable assets.

"If you look around, you'll see there are still some openings for people with Cobol background. But I've heard nothing but praise for Unix and C. That seems to be the big thing around here," said a software quality assurance analyst who, like others, asked not to be named.

A programmer/analyst armed with a stack of resumes agreed. "I'm quite surprised at how few of the recruiters are looking for Cobol experience. It's obvious to me that C is on the rise. Telecommunications specialists are also in demand, from what I've seen here."

According to one graphics applications programmer, the applicants most in demand are those with experience in Unix, C and graphics software design. "The market is great for graphics people like me. I don't know how long that will last, but for the moment, I feel like I'm a valuable commodity."

When asked what advice he would offer to those about to choose a career in software, a former design engineer said, "I'd tell them to get into systems programming on high-end microcomputers. That's where you're going to see the real money. Experience in graphics and telecommunications will open a lot of doors, too."

"My advice," said to a programmer seeking a career change, "would be to get as broad a background as possible in system design and to learn at least a couple of languages."

For $1750 plug into the IBM 3270 with low-cost printers.

InterLynx™/3287 protocol converter features:

- Fully compatible with IBM 3274/3276 controllers.
- Use low-cost ASCII dot matrix and letter quality printers on 3270 controllers.
- 3270 Type A coax-to-async ASCII conversions.
- LU 3 (BSC) and LU1 (SCS SNA/SDLC) modes.
- Full operator panel (including reprint).
- Front panel menu setup.
- RS-232C and Centronics interface standard.
- Pseudo-transparent data feature.

THIEVES from page 1

The gang allegedly traded computers for other "wants," such as bicycles: One swapped a Personal Computer XT for a 10-speed bike.

They wrote their own game programs, sometimes erasing corporations' data to reuse diskettes, and tried hacking, with only minimal success.

They used telephoto camera lenses to peer through office windows and read telephone numbers posted near modems. However, they accessed only electronic bulletin boards with their computers, according to their statements.

The equipment, allegedly taken in breaks throughout DeKalb and Cobb counties here, was recovered in apartment building storage areas and has continued to stream into Fitch's office as the suspects turn in stolen goods in hopes of leniency. As goods are recovered, the value of everything taken in the breaks could soar past $350,000, in addition to the less tangible losses businesses suffered when their software disappeared, Fitch said.

The youths, who remain unidentified under juvenile laws, are awaiting trial.

Export act extended for 30 days

WASHINGTON, D.C. — The U.S. Congress last week extended the Export Administration Act for 30 days as the U.S. Senate neared completion of its bill to restructure government export controls.

The interim measure came last Wednesday with the existing law set to expire that midnight. It became necessary because although the House approved new export controls late last year, the Senate did not take up its bill until late February. When the Senate passes its bill, the two houses must seek a compromise between the two versions before a final measure can be sent to the president.

The Export Administration Act originally expired in the fall, but has been temporarily extended several times.

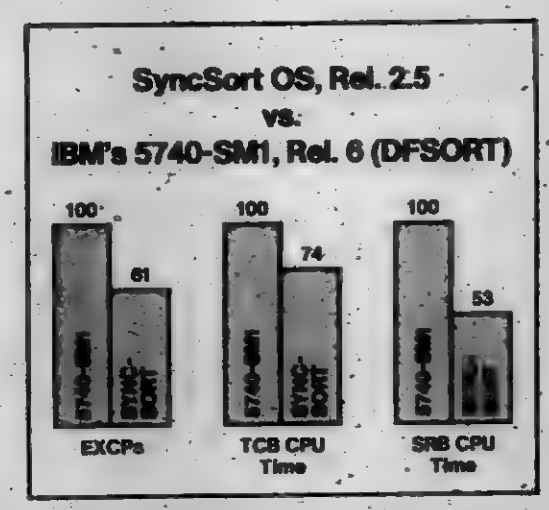
Passage of a new export control law has been delayed because of a continuing controversy over the extent to which exports must be restricted to protect national security.

ENCOUNTER

How new SyncSort outperformed IBM's Release 6 by 36% in their very first meeting!

Call (201) 568-9700.

Try our hot new OS Sort.



Ironically, some of SyncSort's most glowing recommendations come from the mouths of IBM systems engineers. Here's the latest example.

One of our systems engineers recently visited the computer center of a well-known worldwide manufacturer. His mission was to install and demonstrate SyncSort 2.5, the latest and most advanced release of our OS sort program.

As our man sat down at the console, an IBM "MVS Specialist" joined the group. "Can I help with the installation?" he asked. Of course, Our Man replied, thanks for the offer.

After SyncSort 2.5 had been installed, the IBMer came up with another helpful suggestion. "Would you mind if we benchmarked your sort against our 5740-SM1, Release 6? I just happen to have a copy here."

Not in the least, Our Man replied. It was the first duel between SyncSort 2.5 and Release 6 (also known as DFSORT). But our systems engineer was confident that 2.5 could outperform Release 6 anywhere, anytime.

The benchmark was run, and the results bore out Our Man's confidence. SyncSort 2.5 had outperformed Release 6 by a wide margin.

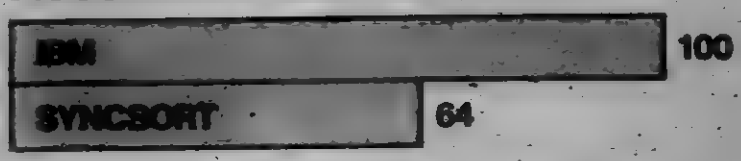
The IBMer was clearly disappointed. But he wasn't ready to concede yet. "Let's take a look at the results on the monitor I've installed," he said.

He explained that the monitor had an "awesome capability" for measuring total resource consumption. It produced an overall "resource utilization" index that reflected the aggregate impact of such vital items as SRB CPU Time, TCB CPU Time, and EXCPs.

Suppressing a grin, Our Man agreed. And this time the IBMer shot himself in the foot with his own monitor.

SyncSort 2.5 had outperformed Release 6 by a whopping 36% – as the charts below indicate:

Resource Utilization Index



How did the IBMer react? Like a gentleman and a scientist. "Well," he said affably, "I've always known a lot of specialized software houses can produce better products than we can in certain areas. Obviously, you've got the best sort."

Then he deleted his sort program from the system and went on to other duties.

Who said chivalry is dead?

syncsort INC.

Syncsort Incorporated 560 Sylvan Ave., Englewood Cliffs, N.J. 07632

CDLA from page 1

be tremendous for CDLA members, Benton explained. They could get more favorable credit terms when writing equipment leases, would write more leases because user turnover of computers would be more rapid and would get access to used computers — already a $2.5 billion-to $3 billion-a-year market — while the machinery is newer and, thus, more attractive. Vendors would see more sales as well, he added.

For end users, the benefits would be just as dramatic, said Charles Greco, director of financial services at International Data Corp., a Framingham, Mass., market research and consulting firm. Users who lease computers would see "more aggressive rates," reflecting the better credit terms dealers could obtain. Those purchasing computers would make out even better, Greco said.

As an example, Greco said that a buyer of a $1 million computer who wants to upgrade to a better machine after three years would, under current law and financial practices, lose two years of depreciation and have to pay back to the government at least one-third of the 10% investment tax credit. It is hard to persuade the corporate finance office to approve a new purchase if it would mean a loss of $433,000 in tax benefits, he noted.

Three-year depreciation would allow an MIS manager to move out obsolete equipment "without some treasurer breathing down his neck," Greco said, because the user would receive the full tax benefits before updating equipment. It would "give the user tremendous flexibility . . . to move to newer technology if it is available," he said.

The CDLA has prepared a white paper with the arguments for the shorter depreciation schedule and drafted a letter to congressmen and senators, seeking support for legislation to implement the change. The lobbying campaign will be discussed at the association's meeting in Acapulco, Mexico, later this week.

The thrust of the letter is that the five-year schedule is too long, unfair and a "bias against new advances in computer technology [that] — if left uncorrected — will hurt the American industry, help Japanese and other foreign competitors and retard future growth throughout the entire computer industry."

Congress will love the proposal, Benton predicted, because of government concern about the health and international competitiveness of U.S. high-technology industries. In any case, CDLA has levied a special assessment on its members to pay for the lobbying effort. "I'm really looking at a big pot. . . . We've got a lot of money in the bank," according to Benton, who has also enlisted the aid of the high-powered Washington, D.C., law firm Patton Boggs and Blow in the campaign.

The association also plans to meet with other industry groups in an effort to form a joint coalition on this topic, Benton said. Officials at the Computer and Business Equipment Manufacturers Association and the Computer and Communications Industry Association told *Computerworld* they are interested in getting the tax law changed, but indicated they have more pressing concerns at the moment, such as export control law amendments and research and development tax credits.

Benton acknowledged that in an election year, there is not much likelihood of tax law amendment, especially one that might be perceived as reducing government revenues. Thus, the campaign may not be successful until 1985, Benton concluded.

British banks give check-clearing system rave reviews

By Susan Blakeney
CW Staff

LONDON — A decade ago, British banks began looking for a faster way to clear checks. Ten years and approximately $30 million later, they have implemented the Clearing House Automated Payments System (Chaps) and realized their goal.

The banks officially inaugurated Chaps on Feb. 9, and according to project leader Edward Stubbs, the chief inspector of London's Bankers' Clearing House, "It's working extremely well, and we've had no problems."

Chaps was developed by the British software house Logica Ltd. The distributed system is expected to extend same-day check clearance (which is presently available only in London's financial district) to individual and corporate clients throughout the country and facilitate same-day clearance of checks well beyond the current 3 p.m. deadline.

"Right now we've limited the system to deal only with payment between £10,000 and £100,000 sterling," which is equivalent to about $15,000 to $150,000, explained Stubbs. "We intend to increase the upper limit within the week to £1 million and eventually remove all limits."

Prior to Chaps, British bankers relied solely upon London's network of 6,000 messengers, who scrambled about the congested city on a daily basis, supporting the bank's paper-based check-clearing system. Now running parallel to the messenger service, the on-line Chaps system enables payments and credits to be transferred at the speed of electricity "immediately and irrevocably throughout the day," Stubbs noted.

Even banks with different computer systems can use Chaps, according to Stubbs, because each bank has a separate electronic gateway into the British telephone information switching service. They communicate with each other through an interface from Tandem Computers, Inc. "The Tandem interface between the bank's main computers communicates over telephone lines — it's a message-switching system, actually," Stubbs said.

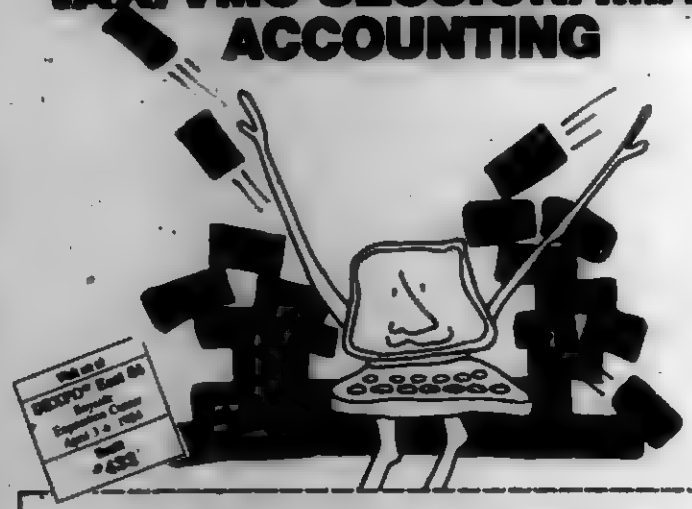
The coded information on each check is electronically recorded and sent from one computer gateway to the gateway of the receiving bank. Payment is guaranteed by the sending bank the moment the information passes through the gateway.

Chaps is expected to result in sizable bank savings from reduced paper and messenger use. Stubbs said 80% of London's banks are already using Chaps, and the full benefits of the system will soon be realized when the remaining banks come on board and all upper and lower limits are removed from the system.

In the few weeks that Chaps has been on-line, it has sparked quite a bit of interest from the financial community, Stubbs remarked. "We've had inquiries from banks all over the world," he said proudly.

"I suppose I'm a bit biased, but I can't tell you anything detrimental about the system. I'm very encouraged," Stubbs concluded.

BREAKTHROUGH IN VAX/VMS SESSION/IMAGE ACCOUNTING



Only EZTRACK™ allows examination and tracking of VMS session/image resource data by user, time interval, terminal port and other key fields. EZTRACK offers:

• General query and interactive capabilities • Flexible report writer and graphics
• Full screen forms reporting

IBM analysis seminar set for May

MILWAUKEE — Fred Lamond, an observer of trends in data processing and of IBM in particular, will present an in-depth analysis of alternative growth strategies for IBM users during seminars in May in San Francisco and Washington, D.C.

Among the issues to be covered in the "Lamond on IBM" seminars are alternative network architectures, compatibility and data base requirements; the future of IBM large systems; and the future of the centralized production center. Lamond will also attempt to answer such questions as "Will the IBM Personal Computer replace the 3270 terminal?" and "Can the 3083 win against Japanese competition?" according to Pakala Bennett, a spokeswoman for Cap Gemini DASD, the seminars' sponsor.

A speaker at conferences around the world since 1975, Lamond worked for five years in market research in Great Britain and has worked for other firms in the computer industry.

The San Francisco seminar will be held May 2-4 at the Westin Miyako, and the Washington, D.C., seminar will be held May 7-9 at the Sheraton International Conference Center.

Both seminars have limited enrollments and are the only U.S. appearances for Lamond this year. Seminar registration is $895 per person from Cap Gemini at 9045 N. Deerwood Drive, Milwaukee, Wis. 53223.

Mother links child's birth defects to VDT use

By John Kirchner
CW Washington Bureau

WASHINGTON, D.C. — A Syracuse, N.Y., insurance company clerical worker told a congressional subcommittee last week she suspects her "slavery" to work place automation caused the multiple birth defects of her recently born child.

Rebecca Alford told the House Education and Labor Subcommittee on Health and Safety that her employer, the Equitable Life Assurance Society, introduced VDTs to its clerical operations with no regard for its employees. This, she said, "enslaved us to the new machinery and subjected us to health and safety hazards."

Her testimony came last Tuesday as the subcommittee opened its investigation into VDT safety. Subcommittee Chairman Rep. Joseph M. Gaydos (D-Pa.) said later hearings will allow representatives of VDT manufacturers, users and the scientific community to present their sides in the growing controversy over possible VDT health dangers.

Survey information released last month by 9 to 5, the National Association of Working Women, contained anecdotal information suggesting widespread health hazards related to prolonged VDT use [CW, Feb. 20, Feb. 27]. Eyestrain, backaches, stress and other ailments resulting from ergonomic factors of terminal design and use are generally conceded even by representatives of equipment manufacturers, who argue most of these problems could be alleviated by better work place design and working conditions.

Manufacturers fight bills

Manufacturers are strenuously fighting legislated regulation of VDT operation, saying the cure would be worse than the problem. They note that long-standing suspicions that VDT radiation causes birth defects, miscarriages and permanent vision damage have been uniformly refuted by several scientific investigations. But prompted by the kind of information produced by 9 to 5, Congress and a number of state legislatures are investigating VDT safety and considering bills on work place automation.

Alford, for her part, said she has little doubt that VDT use causes long-term, serious health problems. She described her co-workers suffering from nightmares, depression, irritability, nervousness and other stress-related problems she attributed to VDT use. Then she added, "Recently, I gave birth to a child with multiple defects. I cannot help but think there is a connection. Though other women in the office have so far been spared this tragic consequence, a significant minority of pregnancies have resulted in miscarriages."

Alford is a representative of the Service Employees International Union (SEIU), which is allied with 9 to 5. Also appearing before the subcommittee was Jackie Ruff, SEIU district director, who said the 9 to 5 data cannot be dismissed as "statistical quirks." She reiterated the group's call for government investigation of VDT-related vision problems, back and muscle strain and what she called "a near epidemic of stress-related diseases."

Elaborating on these complaints, Alford described for the subcommittee the working environment of about 70 Equitable clerical employees, "primarily women of child-bearing years, who work from eight to 10 hours a day, sitting in long rows at impersonal workstations dominated by video display terminals" processing insurance claims.

She said many of the workers "have noticed the deterioration of our vision since working on the terminals. . . . At home, after a day on the tube, I have a difficult time focusing on close objects. My eyes frequently tear and sting. Only after a weekend away from the terminal do my eyes begin to feel better."

Alford complained that "in our office, the windows cannot be opened. The intense heat of the VDT combined with dirty air creates a stifling environment. Simple requests to clean the curtains to remedy some part of the problem have been denied, and many employees consequently suffer from dry, flaky skin, rashes and light-headedness.

"Back and neck problems abound," she continued, "a result of tubes, chairs and desks that we cannot adequately adjust and of long hours sitting in one position. Getting up and moving around during the day to alleviate cramping and stiffness and give our sore eyes a rest is discouraged and, in fact, is penalized since our machines are electronically monitored for productivity."

Noting VDT use is only just beginning, Alford called the Equitable workers "guinea pigs. Judging from the severe problems surfacing already, we may be headed for a society of victims of VDT-related diseases and disabilities." In the absence of collective bargaining for most clerical workers, she said, "strong legislation is needed to provide all VDT users with basic protection."

Consultant sees big business in bypass tech

By Phil Hirsch
CW Washington Bureau

WASHINGTON, D.C. — Recent developments in technologies to bypass local telephone networks may spawn a multibillion dollar business, according to a communications consultant.

However, Jerome Lucas added, about 70% of the revenue produced by bypass facilities in 1994 will be earned by telephone companies rather than by their competitors.

During a seminar here last week sponsored by his market research company, Telestrategies, Inc. of McLean, Va., Lucas offered some predictions on future communications markets. By 1994, he said, CATV, microwave, satellites and other local exchange bypass technologies will be earning $10.7 billion per year; in 1984, by comparison, the total will be $106 million. He expects that optical fiber will account for 65% of the 1994 revenue; CATV and microwave will each have a 15% share, while satellites will account for the remaining 5%.

MCI Communications Corp., one example of a commercial carrier sampling the bypass waters, is testing a bypass system in Fort Lauderdale, Fla., that uses CATV to route analog voice traffic around the local telephone network, Lucas reported here last week.

AT&T and the recently divested Bell operating companies will become major factors in the bypass business, Lucas added. The former has already announced plans to offer "shared multitenant services," one form of bypass, in collaboration with United Technologies Corp., and the local telephone operating companies have requested permission from the Federal Communications Commission to offer digital termination services (DTS), another local exchange alternative.

Lucas expects the carriers to explore a number of other options in the next few years. He specifically mentioned local telephone operating company investment in local CATV networks, efforts by both AT&T and the local telephone operating companies to become communications resellers outside their present markets and use of AT&T's No. 4 Electronic Switching System network switch as a digital private branch exchange replacement for Centrex facilities provided by the local telephone operating companies.

The FCC's latest revision of its access charge plan is almost certain to encourage greater bypass, Lucas said. By deferring access surcharges for residential and small-business users, the commission has made it necessary to increase the usage-based access charges to be levied on interexchange carriers and paid by their customers, he explained. Reportedly, the deferral means that the latter charges must be increased enough to raise an additional $2 billion annually. Business users will pay most of this increase.

Lucas also predicted that by 1992, 89% of all U.S. households will be passed by CATV systems, vs. 43% today, and 60% of all those passed will be subscribers, vs. 43% today. These figures suggest the possible impact of systems like MCI's new Cablephone, which divides a 6 MHz cable TV channel into 240 voice channels capable of servicing 2,400 users.

Several other emerging alternatives to the local telephone network were also mentioned at the conference.

Michael Shiff, satellite equipment marketing manager for M/A-Com DCC, Inc. of Germantown, Md., reported his company has developed a "personal earth station": a two-way, 1.8 meter in diameter dish antenna which reportedly can be installed in six hours and can communicate directly with a Ku band (14/12 GHz) satellite. The uplink data rate is 9.6K bit/sec, and the downlink rate is more, Shiff said.

Computer Graphics '84 slated

ANAHEIM, Calif. — Computer Graphics '84, the fifth annual conference and exposition sponsored by the National Computer Graphics Association (NCGA), will be held May 13-17 at the Anaheim Convention Center.

The conference reportedly will feature 25 tutorials and more than 70 technical sessions on more than 20 computer graphics topics, with an emphasis on microcomputers.

The exposition is expected to showcase computer graphics technology for use in computer-aided design and manufacturing, management, cartography, structural analysis, medicine, animation, marketing and architecture.

Pre-registration for the exhibits is free, while on-site charges range from $10 to $20. Fees for the tutorials range from $185 to $355 and for the technical sessions from $235 to $460, depending on the number of sessions attended. Discounts are available for members of the NCGA and the Institute of Electrical and Electronics Engineers, Inc.

More information on Computer Graphics '84 is available from the NCGA, Suite 601, 8401 Arlington Blvd., Fairfax, Va. 22031.

The world's most advanced personal computer

It all depends on how you look at it.
As a powerful standalone, the Wang Professional Computer offers data, voice, and image processing. And Wang word processing, the world's standard. It can support Wang Office, the most comprehensive office automation software in the industry. And it supports the most popular business software available today.

Another review seen on access charge plan

By Phil Hirsch
CW Washington Bureau

WASHINGTON, D.C. — Another reconsideration of the Federal Communications Commission's access charge plan may be necessary, the chief of the commission's Common Carrier Bureau, Jerald N. Fritz, said here last week. If that happens, the new, higher rates proposed by AT&T and local telephone companies could be deferred beyond April 3, their presently scheduled effective date.

Fritz, who spoke at the Bypassing Access Charges conference sponsored by Telestrategies, Inc., said, "We've just issued the second reconsideration of the access charge order, and from recent reported statements of [AT&T Chairman Charles Brown], we could be looking at a third." He was referring Brown's statement that the commission's latest revision of the access charge plan is unfair to AT&T because it doesn't charge the company's competitors enough for use of local telephone network facilities. AT&T has asked the commission to reconsider this part of the plan.

Fritz said that much has to be done by both the commission and the commercial carriers if present rates are to be replaced with pending, access-charge-based tariffs next month. Both AT&T and the National Exchange Carriers Association, for example, have to resubmit the tariffs they filed last October, and the commission staff must analyze this material and recommend action to the commission. The size of the task is suggested by the fact that when the original tariffs were filed last October, they totaled 210,000 pages.

Asked what would happen should the FCC not meet the April 3 deadline, Fritz said, "We'll cross that bridge when we come to it."

Another conference speaker, economist Alan Pearce, indicated that efforts to restructure intrastate communication services have made even less progress than federal efforts.

One key question, he said, is whether state or federal regulators should decide if local telephone carriers can offer inter-Lata (Local Access and Transport Area) services. If they can, it would be a valuable source of additional revenue and could benefit ratepayers, he added.

As most states contain more than one Lata, the related traffic is intra- rather than interstate. However, the Modified Final Judgment, which settled the government's antitrust case against AT&T, specifically bars the divested Bell operating companies from offering inter-Lata services. Pearce believes the U.S. Supreme Court will have to resolve this question.

Another issue is whether inter-Lata carriers such as AT&T Communications, MCI Communications Corp. and GTE Telenet Communications Corp. will be allowed to offer intra-Lata services. Pearce said the carriers are now "wining and dining" key officials in an attempt to gain entry into various intra-Lata markets. Competition is now allowed by five states, and studies to allow competition are under way in several others.

Va. lawmakers pass categorical computer crime bill

By Paul Korzeniowski
CW Staff

RICHMOND, Va. — The Virginia state legislature overwhelmingly passed a computer crime bill that renders obsolete current legislation and clearly defines categories of computer crime. The bill awaits the signature of Gov. Charles S. Robb, after which it will become effective July 1.

Sponsored by the Virginia League of Savings Institutions, the bill divides offenses into five categories: computer fraud, trespassing, invasion of privacy, threat to security and forgery. "The law clearly labels categories of crime that previously didn't exist," said Daniel R. Burk, an attorney with Thomas and Fiske P.C., the Alexandria, Va., law firm that represented the league. "It is designed to stop anyone who uses a computer for an illegal activity."

Minimum sentences for persons convicted under the new law range from a $500 fine to a five-year prison term.

"There is a wide range of sentences which helps to ensure that the punishment fits the crime," according to Burk.

To draft the bill, Burk studied computer crime bills currently in place in 21 states. "We wanted to ensure that the bill had comprehensive, clear language," he said.

One issue that the new bill does not address is illegal copyrighting. "We may explore that issue next year," Burke noted.

just happens to be the world's most universal workstation.

As a versatile, multi-purpose workstation, the Wang Professional Computer can tie into the entire family of Wang products. It can operate as a virtual workstation on the Wang VS, OIS and 2200 systems. And it can even function as an interactive workstation in the IBM environment, either through remote communications or through local attachment.

The Wang Professional Computer. It's more competitive. It's more compatible.

U.S. sting nabs alleged high-tech smuggler

By Patricia Keefe
CW Staff

NEW YORK — A U.S. Department of Commerce sting operation has netted a French national who allegedly attempted to export a graphics plotting system, which can be used to design integrated circuits for advanced weapons, to an Eastern-bloc country.

The arrest, made late last month here, marks the second successful undercover operation against high-technology smugglers in less than two weeks and involves technology similar to that which was illegally shipped to the Soviet Union in 1979 by Richard Mueller, a West German, according to Commerce. Earlier this month, a U.S. Customs Service sting operation resulted in the arrest of five people, including a Chinese national, on charges of conspiring to smuggle high-tech equipment into China [CW, Feb. 20].

Gilles Gouzene, 28, has been charged with conspiracy and attempting to export without a proper license, according to Assistant U.S. Attorney Peter Norling. At press time, Gouzene had not met his bail, which had been set at $50,000. A grand jury is scheduled to look into the case, and a hearing was held March 1 to determine whether Gouzene should be held for trial.

Gouzene, an employee of the Paris-based import and export firm of Exportations Industrielle et Agricole (EIA), was arrested Feb. 23 in a hotel near John F. Kennedy International Airport here. EIA is owned by Gouzene's father, Pierre, who is alleged to have taken part in the scheme, although no charges have been filed against him.

Anstruther Davidson, acting director of the Office for Export Enforcement, explained that Commerce agents never actually met the father. Instead, they allegedly communicated over the phone and via cablegrams with someone who said he was Pierre Gouzene. The senior Gouzene is believed to be in France, whose extradition treaty with the U.S. does not consider technology smuggling.

The Gouzenes first came to Commerce's attention in March 1983, after they allegedly falsified an export license application for a Xynetics, Inc. Model 2000 Graphic Plotting System valued at $145,000. When the equipment arrived in France, "individuals associated with the export realized that the true destination was not India [as stated on the license], but an unnamed Eastern-bloc country," Davidson said. As a result, the machine was returned to the U.S. Davidson said he did not know whether the French government was formally involved in the decision to return the system.

It was at this point that the Commerce sting went into operation. Agents acting as brokers for the resale and exportation of the system were allegedly offered $5,000 to ship the system illegally. When they cabled the senior Gouzene that a second export license for the system had been denied, he is alleged to have cabled back, "You were recommended for this affair. We expect you to deal with this effectively . . . you knew from the start the difficulties you could meet," Davidson said.

Gilles Gouzene was arrested after a series of meetings during which the $5,000 fee was discussed, although no money ever exchanged hands, Norling said. Both Norling and Davidson declined to comment on whether the EIA and the Gouzenes are suspected to be part of a larger smuggling operation.

Have a story on productivity?

Computerworld's May Special Report will take a close look at software productivity, something our readers are continually trying to improve upon.

The Special Report will focus on application backlogs and the efforts being made to reduce them; the programmer shortage and whether it really exists (or are there other, unseen problems); high-level languages and structured programming; and code generators and reusable code.

Contributions being sought for the Special Report should take one of two forms: a tutorial article discussing an issue or trend in software productivity or a user application story outlining a particular firm's experience with a product or methodology.

Articles must be typed, double spaced and no longer than eight pages. Artwork, such as charts, graphs or photographs, is encouraged. Authors should also include with their articles a brief biography and a telephone number where they can be reached.

The deadline for submissions is March 28. If you have a tale to tell, address it to Donovan White, Special Reports Editor, *Computerworld*, 375 Cochituate Road, Box 880, Framingham, Mass. 01701.

Spreadsheets help micros upset mainframes

PRODUCT SPOTLIGHT

By Paul Gillin
CW Staff

"Mainframe vendors have been trying to reach out to the end user for years. It took the micro people to come along and teach us how."

Ed Spire, president, Dynasoft, Inc.

After years of trying to look like mainframes, microcomputers have finally turned the tables on their big brothers. Spreadsheets, the financial analysis software that single-handedly legitimized the micro in business, are being installed with increasing frequency on large systems.

The success of this upward migration has exceeded the expectations of most observers. In the barely three years that large system spreadsheets have been available, they have garnered a base of more than 3,500 users in the IBM mainframe community alone, according to vendor estimates. And they have set the stage for further integration, which could soon make applications available on the mainframe that are substantially similar to some of the most popular integrated software on the micro.

Vendors interviewed by *Computerworld* expressed heady optimism about the growth potential of large system spreadsheets. Some expect to expand capabilities to include data base management, word processing, integrated graphics and even voice recognition. However, some observers are not so sure.

"Ultimately, all spreadsheet tools will be on the personal computer," said Rick Swanberg, manager of technical planning and operations at Index Technology Corp. in Cambridge, Mass. "Now, because every office doesn't have a [personal computer], people accommodate and go to the mainframe. But eventually, the mainframe spreadsheets are going to offer download to the [personal computer] for responsiveness and upload for consolidation."

Software gaining momentum

But for the short term, at least, the software seems to be gaining momentum. The popularity of large system spreadsheets is largely due to four factors. One factor is political: MIS departments are frantically searching for a way to regain the control they lost when users became enchanted with the fast, dedicated processing power offered by micros. "MIS managers are tired of popping for $5,000 for another [personal computer] every week," Ed Spire, president of Dynasoft, Inc. in Chicago, said. "They'd rather hook into the data base and not have data sitting around in briefcases."

Another major incentive is cost. With prices of even the largest spreadsheets running less than $30,000, the option appeals to some managers who want to protect their existing base of terminals. "There are over four million [IBM] 3270-type terminals out there," said Randy Whitesides, vice-president of The Mega Group, Inc., the Irvine, Calif.-based vendor of Megacalc, a spreadsheet for IBM mainframes. "This has given MIS the ability, with very little money, to make them useful."

Security is also an issue. The new popularity of micro-to-mainframe links has presented the potential headache of users downloading sensitive corporate data onto a diskette that is then left on a desktop or stuffed into a briefcase. Mainframe products retain data integrity while preventing information leaks. Tower Systems International, for example, first planned to make its Omnicalc package a feature of its Surveillance IBM CICS security system. But response to initial advertisements was so overwhelming that the company released the software as a standalone application. "Our best salesmen are DP staffs, because they want to control their empire," Greg Collins, vice-president of marketing and sales, said.

The fourth and most disputed advantage is sheer power. With models ranging up to virtually unlimited size, dozens of mathematical functions, interfaces to other host software and three-dimensional and consolidation capabilities, large system spreadsheets offer advantages many micro packages cannot approach.

Micro limitations

"The micro spreadsheets haven't been good at solving the problem because they're oriented toward putting it all in one box," said William Peake, president of Unicorp, which markets Unicalc for IBM mainframes. "End users will use the micro if they don't need the mainframe capabilities. But they find they're quickly frustrated by the limits of micro spreadsheets."

However, others are not as quick to concede the power issue to the mainframe. "If you look at how quickly a spreadsheet has to operate, the micros are simply faster," said Alan Hirsch, a group managing editor at Datapro Research Corp. and principal author of the report "All About Electronic Spreadsheets."

Hirsch said micro spreadsheets offer nearly all the capabilities of their large system counterparts, but are easier to use and more flexible. Companies that install their spreadsheets on the central computer for the purposes of short-term cost savings or

Spreadsheet usage shifts toward micros

PRODUCT SPOTLIGHT

By Paul Gillin
CW Staff

Large system spreadsheets are not everybody's cup of tea. While some users rave about them, others are finding that microcomputer versions offer better response time and greater flexibility.

Two users of large system spreadsheets interviewed by *Computerworld* reported dramatically different reactions to the software in their installations.

At Saks & Co. in New York, which owns the Saks Fifth Avenue retail chain, Oxford Software Corp.'s Maxicalc has "made our lives much easier," according to Mary Anne Kern, director of financial analysis.

However, Johnson & Johnson Corp. of Raritan, N.J., has seen enthusiasm wane for its Business Model Systems, Inc. Business Modeler package since micros began making inroads into its subsidiary companies, said John Harsh, international management services consultant.

Saks has about 20 users tied into Maxicalc from locations as far away as San Diego, Kern said. The software supports all levels of users in areas including personnel, accounting and operations. The company plans to distribute Maxicalc access to about 50 users, including managers of most retail stores, who will employ predesigned spreadsheet templates.

Better flexibility

Saks installed Maxicalc last August after testing it against Tower Systems International, Inc.'s Omnicalc. Maxicalc proved to be the easier of the two to use and included the flexibility to recalculate on demand rather than automatically, Kern said.

A mainframe spreadsheet was considered "because we didn't want the proliferation of micros that didn't interface with our mainframes," Kern noted. Originally purchased solely for the financial analysis operation, Maxicalc is now used in that division for analysis of capital projects, productivity analysis and profit and loss statements. In other divisions, the software is used to control budget goals, analyse payroll and generate daily management reports.

"The important thing is that we now have control," Kern stated. "I've also been pleasantly surprised with the flexibility of the system. You can delete rows and columns with automatic calculation adjustment and you can control formatting to a great extent. It lets you put out a good-looking report with very little effort."

She noted that user demands for microcomputers have dropped since the software was installed. "I haven't heard of any new requests for the last two months or so," she said. "I think users seem to be willing to wait and see how this goes first."

Kern's only complaint about Maxicalc is that individual spreadsheets cannot be copied into other spreadsheets. However, she said that feature is slated for a future enhancement.

Johnson & Johnson has owned a corporate license to distribute Business Modeler to its international subsidiaries since 1980. The company's management information center currently supports about 45 copies around the world, mostly on IBM System/34s and System/38s.

"When we first brought it in, a lot of companies were very excited about it," Harsh said. "But we're finding out now that many aren't using it as much as they originally intended."

Micro packages apparently present a more attractive alternative, he said. "I don't think Business Modeler is as easy to use as the company says it is," he said. "In companies where micros are coming in, they're discontinuing Business Modeler." He added that in a recent questionnaire, most subsidiary companies did not request the newest release of the software.

Although Business Modeler is a powerful package, "It's not the type of power most users would be able to deal with themselves," Harsh said. "It's useful for something like an interface to the data base or other files. But DP still has to come in for that."

Step-oriented

In addition, Business Modeler is "very step-oriented," Harsh added. "You have to define titles, column headings and line entries. And after you've done all this, you still haven't put in any data."

Nevertheless, some subsidiaries are still gung ho on Business Modeler, he noted. For example, Ortho Pharmaceutical, Inc. of Toronto runs its general ledger on the spreadsheet and uses it for net profit analysis by product group, commercial expense allocation and sales division reporting.

"We will continue to support the user companies," Harsh said. "But in the future, we would probably recommend personal computer tools instead."

Host system spreadsheet vendors eye future

PRODUCT SPOTLIGHT

Caught in a market that may soon start shrinking in the face of competition from micros, vendors of host system spreadsheets are planning to add new functions to their software to keep it attractive to large DP installations.

Unicorp President William Peake believes large system spreadsheets have the potential to become the primary user interface of the information centers of the future. His company's Unicalc is based on a Codasyl model network data base management system (DBMS), in which "the matrix is really a series of records that relate to each other," he said. That feature could make Unicalc useful in writing medium-size application programs.

In the immediate future, Unicorp plans to build a "personal DBMS" on the mainframe, similar to Radio Shack's Profile. The software will allow users to view individual data bases through the spreadsheet and construct small applications without tying up the mainframe DBMS.

The Mega Group has recently added three-dimensional consolidation to its Megacalc spreadsheet, upload and download facilities to the IBM Personal Computer through Megalink and a relational filing system called Megafile. Graphics facilities are planned for the future, a spokesman said.

Tower Systems International, Inc. will "get into a more integrated approach," with its Omnicalc spreadsheet, according to Greg Collins, vice-president of marketing and sales. Future enhancements will include an interface to IBM's Graphic Data Display Manager, word processing, interfaces to popular DBMS and a Basic compiler to allow users to write their own Basic subroutines.

Business Model Systems, Inc. plans "a big thrust into the micro arena," with a recently announced version of its Business Modeler spreadsheet for the IBM Personal Computer, according to Marketing Director Ken Kay. Another project will be to provide a direct tie-in for file transfer between Business Modeler and the DBMS in the user's shop, he said.

Business Model Systems is also researching the area of voice recognition, allowing the user to perform basic spreadsheet functions by simple voice commands. However, Kay admitted the technology to allow voice interaction is still two to three years away.

SPREADS from page 13

MIS control are shortsighted, he said. "Companies that have identified personal computers as the way of the future for productivity increases and [IBM] 3278 emulation are more enlightened than others," he said.

The market seems to bear out Hirsch's remarks. "The micros are really eating into our market share," said Ken Kay, marketing director at Business Model Systems, Inc., which markets Business Modeler, one of the first large system spreadsheets to be released. "Prior to that, we were going great guns."

Large spreadsheet vendors have chosen to accommodate rather than fight the micro. Promoting the optimal capabilities of the mainframe, they promise easier access to host data bases, interfaces to general ledger and other critical applications, work sheet consolidation, query languages and file-level compatibility with popular micro spreadsheets. "It's a lot more than just a spreadsheet calculator," said Marian Sanford, principal engineer in the Large Computer Products Division at Honeywell, Inc.'s Perasonal Computing Facility in Phoenix.

Consolidation has proven to be one of the most popular capabilities of the host spreadsheets. "If you have 15 different people putting together budgets, you can pull that all together very quickly and easily," Index Technology's Swanberg said.

However, that function, too, will soon fall prey to improved micro software, and most observers agree that the host spreadsheet market is headed for a shakeout. In response, the vendors are planning to build a variety of new applications on top of their existing products (see related story). But the true winners will probably be those vendors that fare best at accommodation.

"The winners will be the ones that write spreadsheets so you can work in the same command syntax in both a [personal computer] and mainframe environment and transfer easily between the two, as well as to other software such as word processing and data base," Swanberg said.

The list of vendors represented here was assembled from the forthcoming International Data Corp. report "Requirements for Decision Support: Trends in the 1980s" and represent as complete a collection of large system spreadsheet vendors as was available. For the purposes of this report, large systems are defined as ranging from supermini to mainframes. Vendors were asked to list their offerings in each area and to provide up to five additional capabilities not included in the chart. The micro spreadsheets mentioned here are Lotus Development Corp.'s 1-2-3 and Visicorp's Visicalc.

'Third era' of info systems — DSS — examined

By John Gallant
CW Staff

BOSTON — Choosing the proper hardware and software tools is only one phase in successfully implementing and managing decision support systems (DSS) in the "third era" of information systems.

CW AT SOFTWARE TOOLS

That was the message from Gary K. Gulden, keynote speaker at last week's Software Tools for Distributed Decision Support Systems conference held here.

Gulden, vice-president of Index Systems, Inc., described the first era of information systems as the automation of clerical functions, such as transaction processing. The second era involved the use of large processors for operational control of such functions as inventory management and shop-floor control, he said.

We are now in the third era of information systems, he continued, the age of end-user computing — or DSS — for managerial planning, decision making and "mind support." Control in the third era has slipped from the "high priests" of data processing, requiring a unique management focus to utilize and control the new information systems successfully.

"The end users' needs are old, and the management support systems (MSS) are relatively new," Gulden said. "Reliance on invisible forces is not enough to ensure that you are getting value from these systems in the proper places within your organization."

Organizations typically pass through three phases in the growth of MSS, according to Gulden. The initial phase involves learning, encouragement and experimentation, and it leads to the second phase, in which management attempts to assess the rewards of end-user computing. The third phase is one in which management seeks to regain control, often as a result of the unbridled growth of MSS.

Most companies tend to focus too much attention on the first and third phases, Gulden said. "There is usually a great fanfare about getting started, then it becomes very important to get control. But there isn't enough attention focused on getting value from these systems. Often, people assume that aspect of MSS will just take care of itself, and that is a mistake."

'Find high-impact areas'

In order to develop what Gulden described as a well-balanced approach that ensures both control and value, management must uncover those areas within the organization that will benefit most from end-user computing. "You must find the high-impact areas, those functions within the firm where it makes sense to apply these tools. You must learn to access these so-called markets in your own company. They may not be the obvious ones, but they may have a much greater strategic impact."

One method for doing just that, Gulden explained, is to apply the Critical Success Factors (CSF) approach espoused by Dr. John Rockart, a professor at MIT (CW, April 18). According to Gulden, CSFs are those key areas within a business in which high performance is essential if objectives and goals are to be met. Once the CSFs are identified, MSS tools can be targeted to the proper areas within an organization.

"The CSF technique is a tool for sniffing out high-payoff opportunities for MSS. Most firms, for example, tend to concentrate MSS on the analytical staff. That is an internal market segmentation. But it may not be the area of greatest payoff. The CSFs may point out that your functional and general managers are a valid market for MSS also," Gulden said.

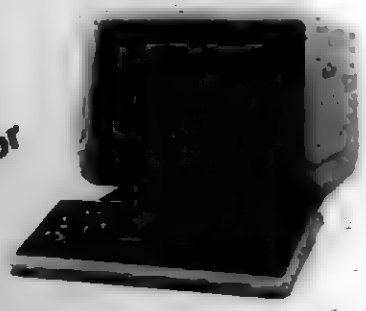
PRC urges increase in Ecom rates

WASHINGTON, D.C. — A hefty increase in Electronic Computer-Originated Mail (Ecom) rates is needed to recover the service's costs and prevent Uncle Sam from competing with private industry, the U.S. Postal Rate Commission (PRC) recommended late last month.

The commission said the new rates for the controversial service should be 52 cents for the first page and 15 cents for the second. Currently, Ecom charges 26 cents for a one-page message and 31 cents for a two-page message; the U.S. Postal Service had proposed rates of 31 cents and 40 cents, respectively. Although Ecom's critics said the PRC has sounded Ecom's death knell, the commission contended the service could begin making a profit in fiscal 1986.

While it greatly increased the Postal Service's proposal for new rates, the PRC endorsed two other requests without change: One would do away with the present requirement forcing Ecom users to send at least 200 messages at a time; the other would allow users to include a business reply envelope. Before the recommendation can be implemented, it must be considered by the Postal Service's board of governors, which is scheduled to meet here tomorrow.

Three Reasons Why... No Other Burroughs Emulator Can Meet Our Standards



1. Features • • • 32 programmable function keys • • • complete keyboard reprogrammability • • • non-volatile RAM can store up to 375 characters • • • with power-on soft key storage can store in excess of 16K bytes of reprogrammed keystrokes.

2. Support • • • multi-million dollar inventory of PC's, CRT's, printers and modems • • • extensive leasing base to meet any budget • • • same day on-site service from nationwide service locations.

3. Price • • • limited time only special leasing price of $75/mo. including on-site service • • • and to totally convince you DASI will give you a two week Free trial so you can see the high standards of this Burroughs emulator for yourself.

DSS execs urged to make blueprint for future

By John Gallant
CW Staff

BOSTON — Decision support systems (DSS) personnel must become architects, providing the blueprints for future data, communications and management structures within their organizations.

Speaking at last week's Software Tools for Distributed Decision Support Systems Conference here, Peter G.W. Keen said DSS management's role is to develop a migration path that will allow organizations to take advantage of future technological advances. Management must be flexible enough to use current DSS tools without becoming locked into them.

"It is a grave mistake to focus only on DSS software or hardware. We need to focus on architecture, to look ahead and shape a base for the future. We need a DSS infrastructure blueprint that will allow us to evaluate opportunities in the coming years, that will allow us to migrate to new technologies," according to Keen, a visiting senior lecturer at the London School of Business and former chairman of the Cambridge, Mass.-based Micro Mainframe, Inc.

In designing a data architecture, Keen said, DSS management is faced with the threatened shakeout among micro manufacturers, a choice between competing operating systems and limited micro-to-mainframe links and deciding whether to select software for a 16- or a 32-bit arena.

Prepare for integration

The communications architecture involves an additional set of difficult choices, according to Keen. DSS personnel must prepare for the integration of voice, data and image; select among services offered in the recently deregulated marketplace; and choose between differing communications standards, such as those for local-area networks.

Keen cautioned that "architectural decisions" based on wrong assumptions can be costly, but planning is critical to ensuring that both hardware and software provide the necessary migration path to new technologies. That planning is also essential to accommodating increased system traffic in the future. "Whoever builds these architectural highways must fuel innovation without losing control," Keen said.

Perhaps more important than the data and communications architectures is the organizational or management structure that supports DSS, Keen said. He said DSS and data processing management have come to an uneasy truce following DSS' inroads into the once sacrosanct realm of corporate data. It was DSS, he said, that created the end-user environment and taught management to go outside DP for decision-making information. "But DSS has failed organizationally — it has no organizational base to support it. The authority still rests with DP, so the meshing of the two is to the benefit of both. We have to get away from the separation of telecommunications, DSS and DP. The technology and skills are changing so rapidly that we must have a mutual sharing of ideas and information between the three," Keen said.

In order to secure its position within the organization, Keen said, DSS must work closely with upper management. "Upper level management must provide direction in the drawing of blueprints and the building of data and communications highways. A good DSS person will work toward that top management commitment to get mandates and action that will end the fragmentary, bottom-up approach to office technology," Keen said.

CW AT SOFTWARE TOOLS

FMS seminar set for April 3

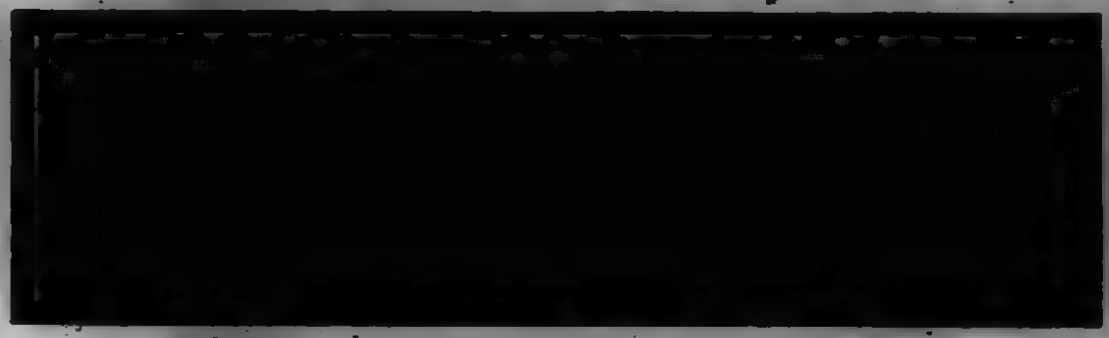
SCHAUMBURG, Ill. — The Computer Automated Systems Association of the Society of Manufacturing Engineers (SME) will hold its Flexible Manufacturing Systems (FMS) '84 seminar April 3-5 at the Hyatt Regency Woodfield here.

The seminar will feature an introduction to FMS and their components. Also scheduled are seminars on FMS implementation, sensor strategies for FMS, material-handling devices, software and control systems, simulation for FMS, group technology aspects of FMS and integrating robotics into FMS.

Eight different user case histories will be presented on successfully implemented FMS. FMS builders and component suppliers will exhibit their wares with a group of tabletop exhibits.

Registration fees are $425 for SME members and $485 for others. SME is located at One SME Drive, Dearborn, Mich. 48121.

Remember the Seminar of 1776?



If Computers Existed 200 Years Ago, These Men Would Qualify as Seminar Leaders for Technology Transfer Institute

BENJAMIN FRANKLIN
As developer of the Post Office would discuss office automation and electronic mail.

ALEXANDER HAMILTON
Electronic banking and transfer of funds.

JOHN HANCOCK
Encryption and security.

THOMAS JEFFERSON
The inventor of indoor plumbing would discuss local area networks.

YOU WON'T FORGET THE SEMINARS OF 1984!

When you need to learn about a specific subject within the computer/communications and data processing industry, you really should learn from an expert. As those men were so considered 200 years ago, so will our speakers be 200 years from now. Call or send for our newest Spring 1984 brochure outlining all of our offerings. We urge you to attend one of our seminars and discover why TTI seminars have become the standard in the field against which others are measured.

Call or write for further information: (213) 394-8305

Please send me more information on the seminars I have checked

Concern mounts over misuse of medical records

By David Gosse
CW Staff

CHICAGO — In the thick of last year's mayoral race here, damaging information about Republican candidate Bernard Epton's medical history was revealed, perhaps influencing the election results.

Some health care groups fear the potential for similar disclosures of supposedly confidential medical records — whether those of politicians or the general public — is becoming more likely. The growing use of computerized medical records in U.S. hospitals is posing an Orwellian threat to patients' privacy, according to one top health care official.

"Never before has the privacy of health records been so endangered," said Dr. Stuart A. Wesbury Jr., president of the American College of Hospital Administrators (Acha), in a recent report that warned of the "potentially serious threat" posed by increased computerization.

New demands for information by the federal government and insurance companies have prompted the college and other health care groups to call for stronger safeguards for computerized medical records. The 28,000-member college is the nation's largest organization for health care workers.

Last October, the government began new payment procedures in which hospitals are paid predetermined rates for the care given Medicare patients, Wesbury said. This has made it necessary for hospitals to correlate patient information and financial information "as never before."

The new payment structure has made it virtually impossible for a hospital to function efficiently without its own in-house computer system, service bureau or other outside time-sharing service, Wesbury noted.

The new Medicare payment procedures raise the likelihood that access to information will be available not only to doctors and nurses, but also to data processing and accounting department personnel, he said. An average of 75 people in each hospital now have access to patient records, according to research by the college.

The government and insurance companies are not the only organizations seeking patient information, Wesbury continued. Many employers are now establishing their own health insurance plans and are seeking patient data before making payments. An employer conceivably could gain access to medical information that the employee wanted kept confidential, he said.

Health organizations are recommending that hospitals implement policies on data security to help protect patient privacy.

Confidentiality of patient records "is a problem, but it can be overcome," according to Peter Wagemann, director of the Institute for Medical Record Economics, Inc., a Boston-based research organization serving the health care industry. The institute has recommended that every staff person with access to patient information be required to sign a statement of confidentiality, with violations punishable by reprimand or dismissal.

Wesbury said he was alerted to the security issue last August after a widely publicized incident in which computer hackers gained access to patient files at the Memorial Sloan Kettering Cancer Center in New York.

That kind of incident "perks up your ears," he said. "What if you have someone who really knows what they're doing and has more sophisticated hardware and software?"

The American Medical Records Association, in a statement on confidentiality and security of health records, urged hospitals using computers to adopt security safeguards such as limiting access to patient records, controlling access by passwords, establishing user input and output limitations, using numbers instead of names for both patients and health care providers and maintaining backup files on magnetic disk or tape.

One group is addressing the problem of access to medical information by creating model state legislation. A drafting committee of The National Conference of Commissioners on Uniform State Laws, a quasi-governmental body comprised mainly of lawyers appointed by the nation's governors, has completed a preliminary draft of a Health Care Information Act.

According to Alan Bennett, a Washington lawyer and reporter for the drafting committee, the legislation, which involves records on paper as well as in computers, contains provisions to protect access of certain medical records, prohibit disclosure of data without patient consent and place restrictions on access by law enforcement agencies.

Input error blamed for Monsanto's hefty GOP gift

ST. LOUIS — Input error has been blamed for the Monsanto Co.'s $12,439 contribution to the Missouri State Republican Party, money that was supposed to go to a Monsanto vendor.

It took more than six weeks for the error to come to light, and it did so only when the vendor, Forest Products Co. of Chicago, demanded its money.

"Apparently one of our employees punched a zero on a computer when they should have punched a three," said Dana Spitzer, Monsanto's midwest regional director of state government and civic affairs.

That input error in August led to Monsanto sending checks of $10,322.62 and $2,117.23 to the state offices of the GOP, whose account number with Monsanto is that one digit different from Forest Products' account number.

Party officials accepted and banked the $12,439 contribution, even though it was far in access of the "$500 or so" that the company usually gives to the party, according to Spitzer.

When Forest Products complained that it hadn't been paid, Monsanto discovered the error and notified Republican State Chairman Shannon Cave.

Spitzer reported that Monsanto expects to be reimbursed as soon as party officials meet to approve repayment.

Naginey named Cause chief

UNIVERSITY PARK, Pa. — Charles H. Naginey, director of management services at Pennsylvania State University, has been elected president of Cause, the Professional Association for Development, Use and Management of Information Systems in Higher Education.

Naginey has served on the Cause board of directors since 1982 and last year served as secretary/treasurer of the organization.

He holds B.S. and M.S. degrees in industrial engineering from Penn State and is a doctoral candidate in higher education at the university.

Need general accounting software for IBM System/38?

We've simply solved your problem.

LAWSON ASSOCIATES has solved it with the first general accounting software specifically designed for IBM System/38. Not merely compatible, but state-of-the-art to fully utilize your computer's capabilities. Compare. You won't find a total software solution like it anywhere else.

DESIGN FEATURES: They include: on line systems using data base management; menu driven, user friendly programs written in RPGIII, the System/38 language; and integrated modules. Their benefits: ease of installation and use, plus maximum employee productivity.

INTEGRATED MODULES: Those available include: General Ledger and Report Writer/Accounts Payable/Accounts Receivable/Fixed Assets/Payroll/Personnel/Purchase Order/Order Entry/Inventory Control

SERVICE FEATURES: Fully documented and supported. Onsite training and implementation. One year warranty. Available now for immediate installation.

For more information, please call or write:
Lawson Associates, 2021 East Hennepin Ave., Minneapolis, MN 55413

LAWSON ASSOCIATES
WE SIMPLY SOLVE PROBLEMS

NEW COURSE ANNOUNCEMENT

BECOME AN IMS EXPERT

SysEd offers challenging "hands-on" training for motivated programmers who want to be real pros and are willing to work.

Our experienced instructors specialize in using real-life programs and design problems. Whether it's IMS Data Base Design, IMS/DB (DL/I) Application Programming, IMS/DC & Message Format Services Programming, IMS Recovery and Restart or IMS Utilities, they encourage students to bring in the specs of their own projects for discussion and analysis.

SysEd students spend one third of class time in actual hands-on workshop sessions with our 4341/II computer. There are six 3270 terminals dedicated to the class. Each student receives an original manual especially designed for each course. The manuals are comprehensive guides and programming models written especially for each course. They are thorough, clear, and well organized, and serve as reference manuals long after the course.

Classes are held at SysEd's fully equipped classroom/computer facilities in New York City and Chicago. Class size is limited so applications are accepted on a first come first serve basis.

Customized course offerings are also available for on-site sessions at company installations.

Other Technical Curricula include: CICS, IDMS, VSAM, and MVS.
For information, call Dave Shapiro (212) 889-3386.

INTERNATIONAL REPORT
CW International News Network

AUSTRALIA

ADELAIDE — Competition in the large financial systems market is heating up following the entry of a new player, Walker Interactive Products, Inc., represented here by SPL Australia Ltd. SPL recently beat out strong competition from other established vendors — SI Products, McCormack & Dodge Corp., Arthur Andersen & Co. — in winning a major contract here from oil mining company Santos Ltd.

CHINA

BEIJING — Eastern Computers, Inc. (ECI) has unveiled a Chinese microcomputer that features 30,000 Chinese characters. The ECI 3916 system comes in two versions — one for the People's Republic of China and one for Taiwan. According to the vendor, it takes the user between three and eight days to become proficient at entering data into the system. The 16-bit system comes with 256K bytes of random-access memory, 1.2M bytes of floppy disk capacity, full word processing keyboard, two serial ports, one parallel port and a 25- by 40-line character display screen. It is priced from $4,495.

FRANCE

PARIS — Gixi, a French software and engineering house, has launched a 2048- by 2048-pixel graphics terminal called Radiance 2000A. Developed for computer-aided design and manufacturing applications, the terminal consists of a 20-in. screen, a keyboard and a digitizer. It is said to be compatible with Tektronix, Inc.'s 4014/4016 units and costs approximately $17,000.

JAPAN

TOKYO — Toshiba Corp. has released a 5¼-in. floppy disk drive called ND-06D that can handle up to 1.6M bytes — the largest memory capacity available with a 5¼-in. product, the vendor claimed. In addition, because of its large-scale integration design, the disk drive can reportedly transmit data at the rate of 500K bit/sec. The product is priced at $221.

■

TOKYO — NEC Corp. has released an operating system for its MC Series of minicomputers that is compatible with Unix software. Called MS-UX, the product features window display screen editing functions via windows, numerical value calculation, input and editing of Japanese text and a remote job entry facility to NEC's Acos Series mainframe. MS-UX will be available in April for $6,809.

WEST GERMANY

FRANKFURT — Within a few short years, one out of every two personal computers will be used in a commercial environment, according to a recent report published here by Diebold Deutschland GmbH. The analysis claimed that big business is making great use of the microcomputer, while there is not yet much personal computer activity in small and medium-size companies.

■

BOEBLINGEN — Hewlett-Packard GmbH announced that it is very optimistic about its growth rate. During fiscal year 1983 (ending September 1983), the company showed a 20% increase in revenues. According to chairman of the board Eberhard Knobloch, HP GmbH is in the running to claim the No. 3 spot in the personal computer market here.

■

MUNICH — The German Federal Postal Administration has commissioned a consortium of German telecommunications and aerospace companies, headed by Siemens AG, to establish a German communications satellite system by 1987. The system has three main tasks to accomplish: high-speed transmission of telephone and teleconferencing calls and data; expansion of telephone and data channels to Berlin; and trial operation of a new frequency range for future television use, according to a consortium spokesman.

RAMIS II MAKES YOUR INFORMATION CENTER A GREAT PLACE FOR PEOPLE.

RAMIS II's complete solution is the most effective way to multiply the productivity and satisfaction of your end users and your Information Center staff. Today, RAMIS II means success at hundreds of Information Centers around the world.

POWER AND SIMPLICITY FOR END USERS

RAMIS II provides everything users need for maximum productivity. Its powerful report writer, relational database and language, full-color business graphics, SAS® interface, and many other capabilities meet the most advanced decision support needs. And, with our new RAMLink, IT series, and RAMIS II/PC software, end users have the ideal solution for mainframes and personal computers.

RAMIS II English comprehension extends the power of your Information Center to a multitude of new computer users. Through advanced knowledge-based technology, even people who've never been on speaking terms with a computer can ask questions, obtain answers, and create reports in only a few minutes using everyday English.

EFFICIENCY AND RELIABILITY FOR SUPPORT STAFF

Our complete solution lets your existing staff support many more users by dramatically reducing the number of products you need. And RAMIS II makes your support job easier with built-in computer-based training plus facilities to monitor and control usage.

RAMIS II delivers the performance and reliability needed to tackle even the largest decision support tasks with confidence. In fact, because RAMIS II is also a complete application development system, single-user systems can evolve smoothly into full-fledged applications.

SAS® is a registered trademark of SAS Institute, Inc.

LISTEN TO OUR USERS

Send for our free guide, "Why Information Centers Succeed." It contains practical suggestions for success from RAMIS II Information Center staffs of organizations like yours. Organizations that have found that RAMIS II, the real leader in complete software for business, is the sure way to make an Information Center a great place for everyone.

"Rockwell International eliminates order management paperwork and ships products faster with a ***Tandem NonStop*** *Computer System."*

Robert F. Murovich, VP and Controller
Avionics Group

"Our Tandem NonStop computer helps us dramatically streamline order tracking for our broad line of products there at the Collins avionics facilities in Cedar Rapids. This automated operation has meant we've been able to ship our products faster, as well as respond to customer inquiries in a much more timely, accurate fashion.

"The Tandem system consolidates all data pertaining to the orders, from order entry to scheduling, inventory issue to packing lists, and right on down the line to shipping. And, because the system is on-line, other departments have immediate access to this information as well. Accounting, for example, now generates invoices automatically, resulting in much improved cash flow; Manufacturing is saving $175,000 a year in internal freight charges due to the reorganization of ordering and shipping procedures; and the Group as a whole has been able to eliminate more than 300,000 reproduced documents a year.

"Other system benefits contributing to our improved customer service include better control of backorders, more accurate pricing information, and the ability to make detailed forecasts of market conditions for planning purposes. The net result is an operation that is helping us achieve some very significant gains in plant productivity.

The NonStop System. Ideally suited to on-line transaction processing where continuous availability of up-to-the-second information is critical to your business.

Tandem. Fully supported by worldwide sales, training, service and manufacturing organizations.

For information on how a Tandem NonStop system can improve your productivity or your P/L statement, call your local sales office or Tandem Computers Incorporated 19333 Vallco Parkway, Cupertino, California 95014, U.S.A. Toll Free 800-482-6336 or (408) 725-7500 in California.

Model assesses how OA equipment improves productivity

By Lynn Haber
CW Staff

COLUMBUS, Ohio — A computer model that assesses how office automation equipment can improve office productivity has been developed by a research and development facility here.

The model is an offshoot of a program that Battelle Memorial Institute's Columbus Division has been working on since 1978 to measure industrial productivity at the plant level.

The office model enables researchers to measure total current productivity by clerical, management and technical personnel, then determine specific areas in which improvements can be made.

The Battelle model can be used to measure productivity in industrial, service and government organizations. Such functions as budgeting, purchasing, data control, management and support can be analyzed.

"Once we establish a relative measurement," explained Dean F. Poeth, a researcher at the facility, "through the use of the model, we're able to play 'what-if' games.

"If you introduce such and such equipment, you might have such and such effect. However, there is capital investment, energy requirements and space allocations. . . . Exercising the model, we come up with a prioritized list of what one might do to improve the productivity, given the measures that have been internally generated."

Will send in team

To utilize the productivity model, a company must contract to have Battelle evaluate the areas it is interested in having studied. Battelle will send in a team that includes computer people, industrial engineers and other individuals with a multidisciplinary background to match the area being evaluated to become the facilitators of structuring the model.

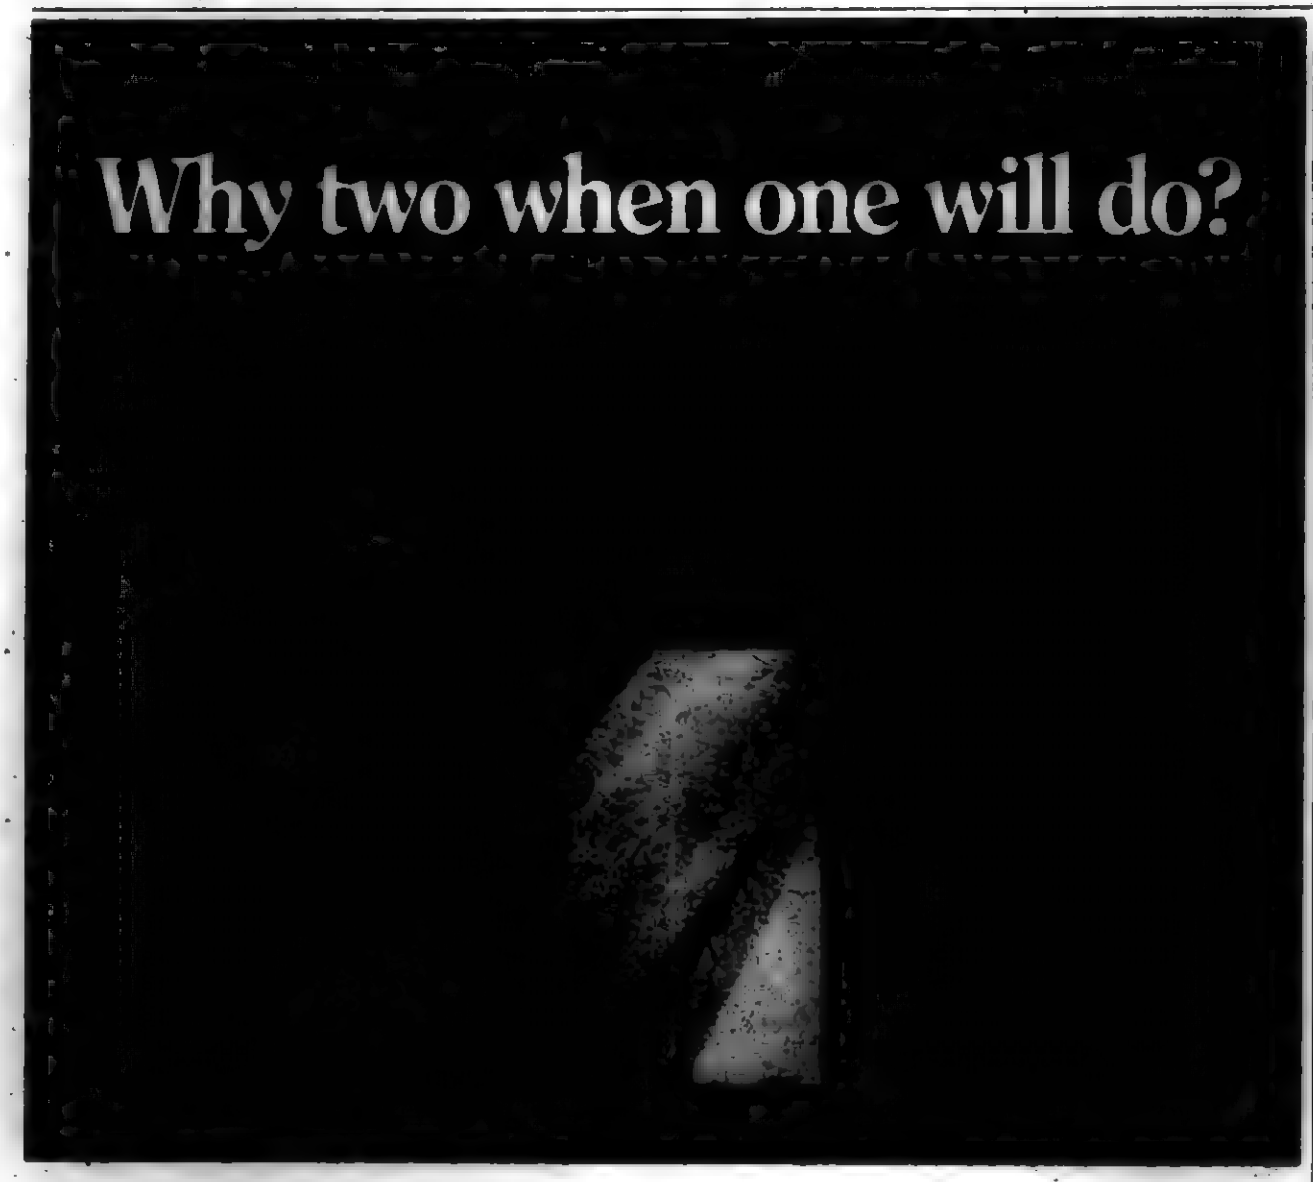
The researchers will modify the computer program for that specific model and implement it so the contracting company's employees can run it.

"It's not a canned program at all," Poeth said. "It's used as a planning tool designed for people to look at the potential for inputting office automation or any kind of productivity improvements," according to Poeth.

Poeth estimated that for a typical organization with a few hundred people, the modeling study could be done in three months.

The cost for a program evaluating several hundred people to 10,000 could range from $30,000 to $50,000.

Further information is available from Battelle Columbus Laboratories, 505 King Ave., Columbus, Ohio 43201.



Lee Data's universal terminal system design provides access to both 3270 and VT100 applications.

Now with Lee Data's new 3270/Async Communication System (Series 400) you can eliminate the cost and inconvenience of needing separate displays for access to 3270 and VT100 applications.

The Lee Data universal terminal system approach is another innovative Lee Data design that allows a single Lee Data display to access applications and data from an IBM CPU, a non-IBM system such as DEC, H-P or Prime, and timesharing services. And a simple command entered from the display keyboard is all that is required to switch from 3270 to VT100 operating mode and back again. What could be easier?

The Series 400 System incorporates a new hybrid approach to system operation that is simpler and more efficient than protocol conversion. This approach allows a Lee Data controller to provide dedicated 3270 and VT100 processors for concurrent, but independent application access.

In addition, a single Lee Data controller provides you 3270 compatibility via either a remote BSC or SNA/SDLC or a local SNA or non-SNA interface, as well as 1 to 16 RS232C ports for your asynchronous application needs. Line speeds available are from 300 to 19,200 BPS.

The Series 400 System also provides you support for up to 32 devices, including Lee Data's unique All-In-One display that offers dynamic selection of 4 screen sizes—three 80-column and one 132-column. Lee Data's 3279-compatible color displays and a full line of printers are also available as part of the 32-device complement.

3270 and VT100 capabilities combined in a single terminal system—a reality with the new 3270-plus-Async system from Lee Data.

Discover what our system can do for your company's terminal network. Call our system specialists toll free:

Course on SAS announced

ARLINGTON HEIGHTS, Ill. — Advanced Systems, Inc. has announced a videotape training course titled "Using the Statistical Analysis System." The Statistical Analysis System (SAS), developed by SAS Institute, Inc. in Cary, N.C., is a data retrieval and management, programming, statistical and reporting system.

The course, which was designed for managers and programmers, teaches how to write SAS code, input and analyze data and produce reports.

The course is leased to companies for prices that range from $50 to $100 per year, depending on the length and type of lease, the vendor said.

Advanced Systems is located at 2340 S. Arlington Heights Road, Arlington Heights, Ill. 60005.

Japan no big threat to U.S. vendors, Darpa chief says

By John Kirshner
CW Washington Bureau

WASHINGTON, D.C. — A top Pentagon researcher last week said Japanese computer makers, contrary to fears widely expressed in this country, do not threaten to supplant American firms as the major suppliers to the U.S. market.

Dr. Robert S. Cooper, director of the Defense Advanced Research Projects Agency (Darpa), dismissed fears that the Department of Defense and other users of advanced computer systems might have to rely on Japanese companies for supercomputers by the end of the century.

Cooper told an Institute of Electrical and Electronics Engineers (IEEE) conference here Tuesday that he has just returned from a visit to Japan during which he inspected a number of university, government and industry high-technology laboratories and viewed operations of the new class of supercomputers recently installed by Hitachi Ltd. and Fujitsu Ltd.

Cooper was "very much impressed" with the new supercomputers and said they may prove better than existing U.S.-made computers by some performance criteria. But, he added, the real question is how the Japanese will compete with the next generation of U.S. supercomputers, those with 10G floating-point operation/sec now under development by ETA Systems, Inc. and Cray Research, Inc. for 1986-87 release.

Although he was concerned that the Japanese may have a two-year jump on those American efforts, Cooper also insisted he does not believe the Japanese will overtake and supplant the U.S. in this area. "I feel our industry is highly competitive," he said. "The Japanese have a serious problem on their hands trying to address any market in the U.S."

In any case, Cooper said, Darpa's "strategic computing" program, aimed at developing several classes of superfast machines using artificial intelligence to control advanced weapons systems in the 1990s, guarantees the U.S. will be able to supply future supercomputer needs.

Of the Defense Department program, he predicted that "much of the research will spin off rapidly" to boost the American computer industry. The program, with a proposed 1985 budget of $95 million, will eventually cost $150 million a year, according to Cooper.

He also called the program "an insurance policy" against IBM's decision not to reenter the supercomputer industry. He said IBM is "the key to the whole issue" of U.S. dominance over Japan in this industry. Unless IBM becomes more aggressive in advanced computers, it will continue to lose worldwide market share, he said, predicting its market share could drop to 20%.

Other speakers at the session on supercomputers also looked to IBM for the continued health of the U.S. computer industry. Dr. Kenneth G. Wilson, Cornell University physicist and 1982 Nobel laureate, called for a cooperative program involving IBM and other industry firms to develop a business market for supercomputers.

Wilson said he has been assured by executives at ETA Systems, the Control Data Corp. supercomputer spin-off, that current technology permits development of a $500,000 supercomputer if there is a market for it. He suggested that U.S. government support is also crucial to the U.S. supercomputer effort.

Wilson, who has been active in trying to get greater U.S. scientific community access to advanced computing facilities, chastised Congress for ignoring what he called critical economic and scientific needs and spending too much time on defense, the deficit, taxes and "struggling with all the other stupidities that go on in this town."

Engineers group looks to start research centers

By John Kirshner
CW Washington Bureau

WASHINGTON, D.C. — The National Academy of Engineering (NAE) has proposed establishment of 25 engineering research centers, joining industry and academia in various engineering projects, including design, manufacture and operation of computer and telecommunications systems.

In a report to the National Science Foundation (NSF), which has provided for initial support of the program in its proposed 1985 budget, the NAE said the centers would enhance the quality of American engineering education by familiarizing students and faculty with "how engineering knowledge is converted by industry into societal goods and services."

The centers are needed, according to the report from a special NAE panel, because of a "particular weakness" in current engineering education: "an overemphasis on analytical research, with less opportunity for 'hands-on' experimental research; inadequate exposure of engineering students to engineering practice; and a lack of interaction between faculty and industrial practitioners of systems engineering."

The academy said the centers, which would be established at engineering schools, would bring an interdisciplinary approach to industry/university research.

NAE noted an NSF report that claimed there is a growing need for engineering education that cuts across the engineering subdisciplines and applied sciences.

The academy estimated each center would cost between $2.5 million and $5 million per year, requiring a minimum NSF support level of $100 million. However, the NAE report suggested the program could be developed in steps, with an initial establishment of five to 10 centers.

DEC TO IBM SNA

Now available...full SNA capability for your DEC computer! Comboard/SNA gives your terminals access to IBM interactive applications. Data can be transfered between systems transparently, all in the complete fully supported package, from Software Results.

Comboard/SNA is a proven and reliable, single-board, 256KB communications computer that plugs into your DEC Unibus. Teamed with Comboard software, the system is a cost-effective solution to troublesome SNA communications problems.

Comboard/SNA allows your DEC to emulate an IBM PU Type 2 communications node. You have a full gateway into your SNA without the trouble of passing through a secondary network.

For further information, fill in the coupon below or call Software Results... the leader in DEC to IBM communications.

Survey reveals OA accepted with open arms

By John Gallant
CW Staff

A recent survey of more than 500 secretaries and administrative assistants indicated that despite management fears, office automation has been accepted with open arms.

But the survey also revealed that for those who master the skills of the high-technology office, expectations of higher pay and career advancement often go unfulfilled.

Titled "People in the Electronic Office," the survey was conducted for Kelly Services, Inc. by the New York-based research firm Research & Forecasts, Inc. The nationwide poll was designed to gauge the sentiments of 507 full-time corporate secretaries toward recently introduced office automation tools, primarily word processing equipment.

On a scale of emotional responses ranging from love to hate, 83% of the secretaries said they love WP equipment, while none expressed the opposite reaction. Eighty-seven percent said they feel WP skills will lead to new career opportunities, and even more (88%) said those skills will result in salary increases.

But the survey revealed a number of puzzling discrepancies, according to Kelly Services spokeswoman Rose Leach. Despite the optimism of most secretaries, only 30% had actually received pay increases as a result of acquiring WP skills. And when asked what opportunities open up through WP skills, very few of the respondents named positions which could be considered even middle management.

Furthermore, the respondents said old-fashioned personal initiative still ranks No. 1 in determining pay raises and promotions.

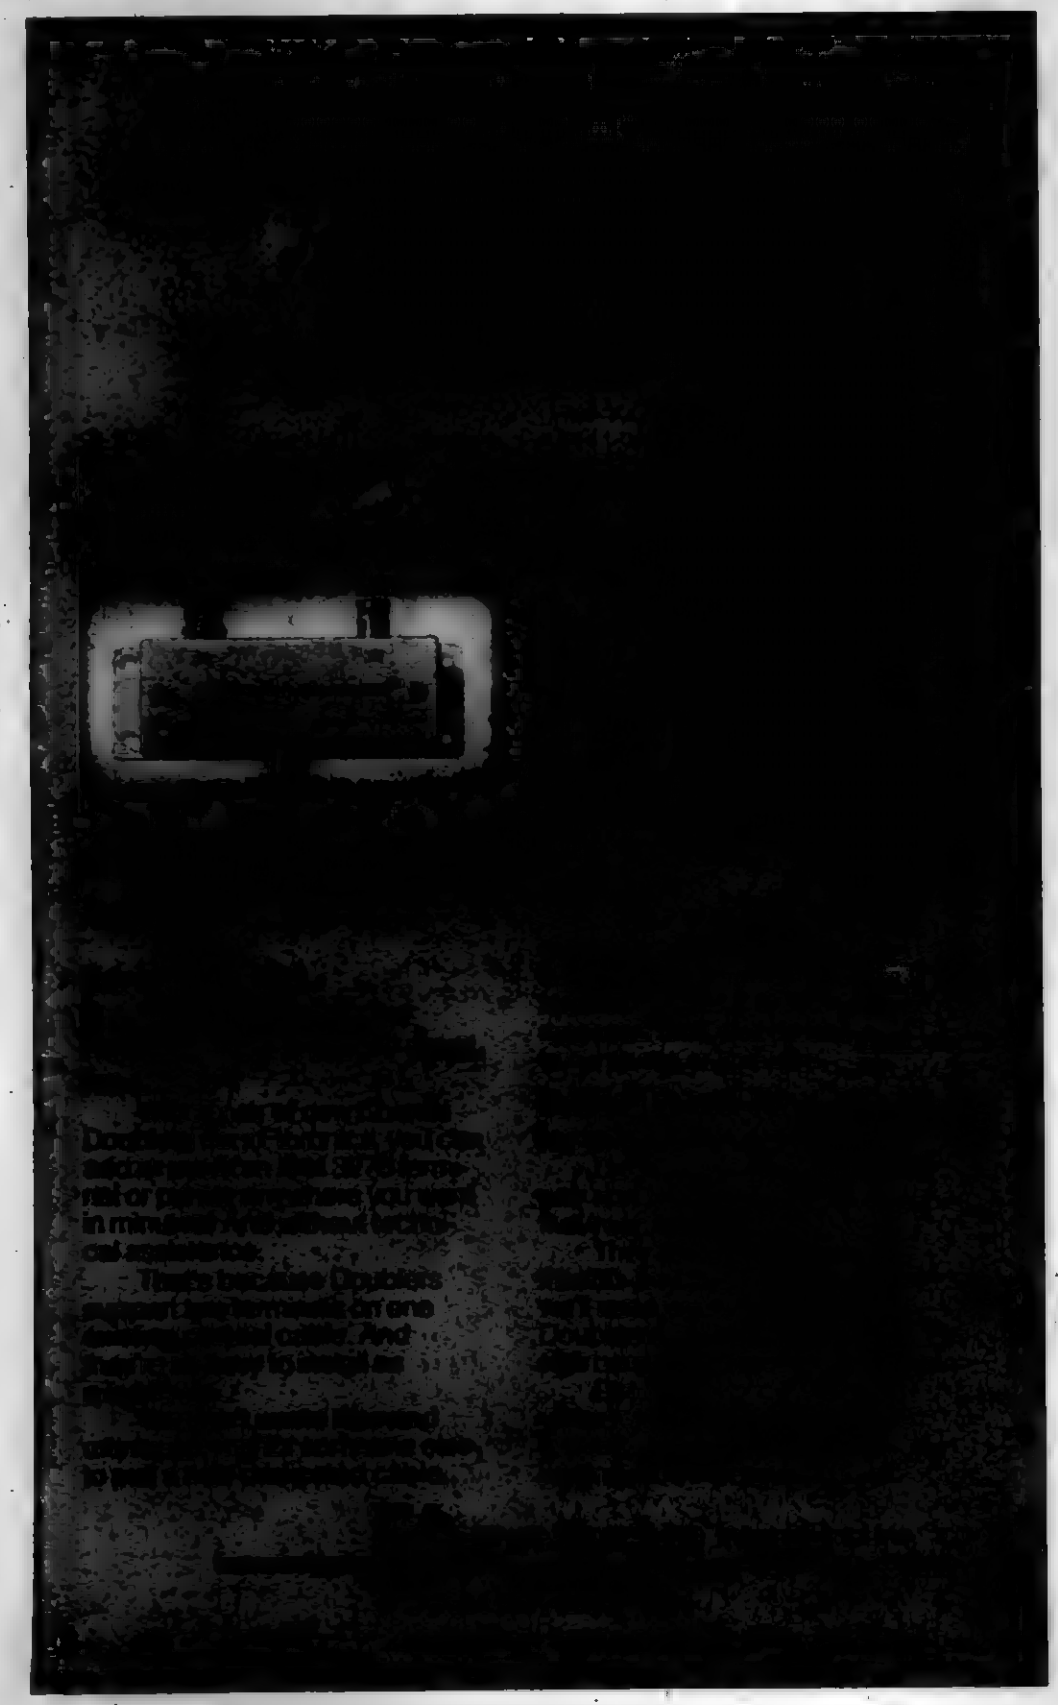
Three-quarters of the secretaries said OA equipment frees them from typing chores and allows more time for work that involves decision making. But when asked what new responsibilities the electronic tools allow them to undertake, most named tasks that Leach described as traditional secretarial duties, such as drafting letters and researching and writing reports.

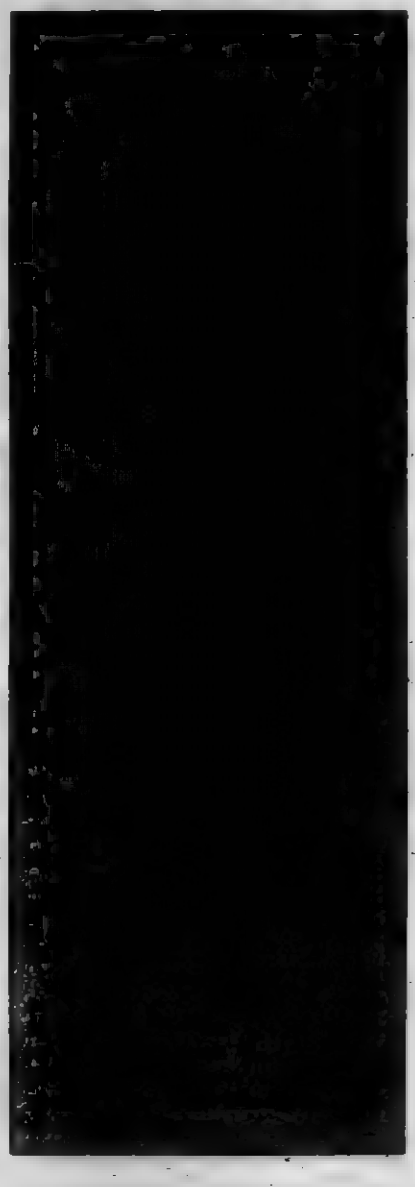
"We were very excited about the finding that secretaries are pleased about word processing. There has been a lot of concern and confusion about how they would adapt to that," Leach said. "But more important, the survey also brings out the disparity between their beliefs and reality."

Age, according to Leach, was an important factor in the survey. Forty-eight percent of the respondents under age 25 reported pay increases resulting from WP skills, compared with much lower figures among older secretaries. The younger secretaries said their knowledge of WP is more important than such customary skills as shorthand, while their older counterparts place more value on such traditional abilities.

In addition, almost a third of the younger respondents already had training in either Cobol or Basic programming. Leach said those results reflect the "mobile secretary of the future, one eager to learn about new technologies and to advance as a result of the newly acquired skills."

Copies of the survey are available free from Kelly Services, Public Relations Department, 999 W. Big Beaver Road, Troy, Mich. 48084.



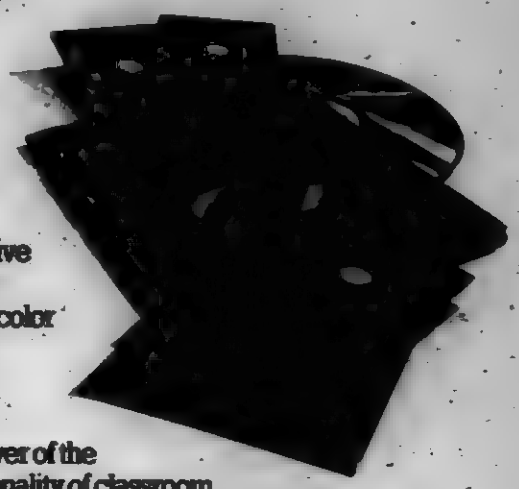


A WORD TO ANYONE LOOKING FOR UNIX® TRAINING:

Guaranteed.

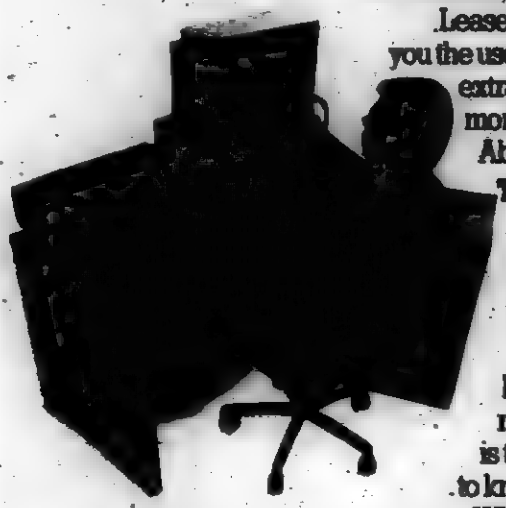
Introducing Vision. The first UNIX Interactive Videodisc Training Curriculum. And our 30-Day Money-Back Guarantee.

Simply lease any one of three Vision Courses: UNIX Overview, UNIX Fundamentals or 'C' Language Programming. If you're not satisfied, for any reason, return it for a full refund. No questions asked.



A Free IBM PC and Laser Discplayer.

Lease all three Vision Courses for one year. And we'll give you the use of a complete interactive videodisc system at no extra cost. You get an IBM PC, laser videodisc player, color monitor and Interactive Training System Controller. Absolutely Free.



Training in Action.

Interactive video training combines the power of the computer, the speed of a laser disc and the personality of classroom instruction. To involve, to motivate, to excite. To capture and hold a student's interest in a way no other medium can.

Students learn by doing, so they learn faster, comprehend better and retain information longer. Because training is targeted, they learn only what they need to know to do the job. Now.

What's more, Vision was developed by Interactive Training Systems, the acknowledged leader in interactive video training. And Computer Technology Group, a leader in UNIX training.

The result? UNIX training so fast, so effective and so affordable, we back it with a full 30-Day Money-Back Guarantee. (Frankly, it's one guarantee we're confident you'll never get to use.)

Send us the attached coupon. Or call us at 1-800-227-1127.

AFTER MARCH 31, 1984 OUR FREE INTRODUCTORY OFFER IS NO LONGER FREE!

☐ Please have a representative contact me immediately.

☐ Please send me more information about Vision, the UNIX Interactive Video Training Curriculum.

Portable to help mountaineers scale Everest

By Paul Somerson
CW Staff

In 1924, British explorers George Leigh-Mallory and Andrew Irvine unsuccessfully attempted to become the first climbers to reach the summit of Mt. Everest in Tibet. On February 27 of this year, 16 mountaineers began a three-month quest to be the first team of Americans to retrace the British explorers' course. A portable computer will play an integral part in the journey.

"The computer will serve a number of purposes," said Robert Berg, an expedition member and president of Zepher Industries, Inc., a Seattle-based distributer. "With it, we can easily alter our route. Variable factors such as temperature, snowfall, energy consumption and available equipment are used to determine the best route to the summit. Completing calculations with a computer will be much easier than using a pencil and paper."

The computer will also be used to monitor expedition members' health. After medical information, such as pulse rates, is input, recommendations will be made concerning whether climbers should journey into the cold or remain in the expedition's warm research tent.

Seven tons of equipment, eight yaks and 15 Tibetan porters are part of the expedition, dubbed Ultima Thule, a Greek and Latin phrase meaning "the ultimate outer limits of achievement."

"The computer will help us track inventory by calculating how much food and energy is available and how much is needed for each part of the trip," Berg said, who has climbed Mt. Rainier and Mt. St. Helens in Washington.

The mountaineers were scheduled to pitch camp at seven locations. While the computer will not reach the mountain's top, at 29,028 feet, it will be used at a camp located at 21,000 feet, where temperatures will be quite chilly. "Throughout the trip, temperatures will range from 0 degrees [Fahrenheit] to 40 degrees below 0," Berg said. "The heat will be on at some times, but not all the time. We have to conserve as much energy as possible. One reason we decided to use a portable computer was that it doesn't use much electricity."

One climber, Tom Clement, must ensure that the computer functions in any weather. According to Berg, Clement teaches at the University of Washington and contacted a friend to write the programs that will be used on the trip.

The expedition costs approximately $600,000, according to Berg, with a number of items donated: Microsoft, Inc., based in Bellevue, Wash., helped write the programs; Columbia Data Products, Inc. of Columbia, Md. donated its Multipersonal computer; and Okidata Corp. in Mount Laurel, N.J., presented the expedition with its Microline 92 printer.

Weather will be a critical factor in the expedition's quest to reach the summit. "If the monsoons kick up early, we will have to quit," Berg said. "We're hoping to get cooperation from the weather." If all goes well, the expedition will be completed on June 1.

CASE #4

SOFTWARE SURVIVAL

Aaahh. The headaches of developing software. Your projects are too late. Too expensive. And frankly, don't always meet user needs.

So you look for help. You turn to software development aids. But instead of getting peace of mind, all you get are piecemeal solutions. Not so with Nastec.

NASTEC CASE 2000™ products provide computer aided development and a managed life cycle approach that fit well with your existing methods. You'll have more control over your software development process, which means higher quality software. On time. On budget.

So now you have a choice. You can take two aspirins. Or you can call Nastec in the morning.

Call toll-free 1-800-872-8296 (in Michigan 313-353-3300). Or write Nastec Corporation, 24681 Northwestern Highway, Southfield, MI 48075, for more information about our NASTEC CASE 2000™ Workstation and Software Products. Our software survival solution is just what the doctor ordered.

The Computer-Aided System and Software Engineering Company

NASTEC CASE 2000

We don't promise.
We deliver.

Adcis session slated for May in Columbus

BELLINGHAM, Wash. — Dr. Fred Hofstetter of the University of Delaware has been elected as the Dean Memorial Lecturer for the 25th International Conference of the Association for the Development of Computer-Based Instructional Systems (Adcis), an organization for applied research in the use of computers for support of direct instruction.

The Adcis preession and conference will be held May 14-18 at the Columbus, Ohio, Hyatt Regency Hotel. Running from May 14 into the morning of the 15th, the preession will be devoted to in-depth presentations and discussions of several topics.

Hofstetter, who is director of the University of Delaware's Office of Computer-Based Instruction, has served as principal investigator in several research projects dealing with instructional technology.

Conference fees for members are $50 for the preession, $85 for the conference and $105 for the conference and preession. For nonmembers, the fees are $60 for the preession, $120 for the conference and $140 for both. For students and spouses, the rates are $20 for the preession, $35 for the conference and $35 for both, according to a conference spokesman.

More information on the conference is available from the Adcis International Headquarters, located at Miller Hall 409, Western Washington University, Bellingham, Wash. 98225.

Soup up your Volkswriter.

Everybody knows Volkswriter, the word processing software package that's become synonymous with high performance. Now, there's a way to get even higher mileage out of your Volkswriter. Hook it up to a Dataproducts P Series dot matrix color printer.

The versatile P Series translates the executive class, word processing capabilities of the Volkswriter into brilliant full color charts, graphs and text. It delivers a full page of text quality print in nothing flat while its sheet feeder automatically prevents loading hassles. And the P Series uses pin feed or plain paper and has the brains to fill every appropriate line with crisp, sharp copy, even if it has to justify to do it. And the P Series color printer has dual speed capability for correspondence quality output for the Volkswriter's many word processing applications and high speed output for draft and spreadsheets.

The Dataproducts P Series color printer. Think of us as a supercharger for your Volkswriter.

For more information go to your nearest computer store and ask about the Dataproducts P Series color printer, or call Dataproducts, 1-800-258-1386.

Dataproducts computer printers

Nobody puts ideas on paper so many ways.

Capable COBOL.

For over twenty years, COBOL has proved it can handle the most awesome data handling requirements of the business world.

And Microsoft® COBOL brings this power to the MS™-DOS environment in an even more flexible version. It's the ideal choice for transporting and adapting the thousands of mainframe and minicomputer programs now on the market.

Microsoft COBOL was designed after the ANSI COBOL standard. Its quality and performance has been fully certified by the GSA.

Microsoft COBOL includes a complete set of file handling facilities including support for sequential, line sequential, relative and B+ tree indexed sequential (ISAM) files.

MICROSOFT. The High Performance Software

The advanced screen handling features, compatible with Data General,® make it easy to create forms and menus for interactive user programs. Direct cursor positioning, highlighting, automatic format conversion, projected fields, and automatic field skip are just some of the capabilities.

An interactive source code debugging tool allows you to step through your program in symbolic form. There is no need to wade through object code and addresses in memory to see what is going on. It's a complete development package.

Applications developed with the compiler can be distributed without a runtime support charge.

Like all Microsoft languages, the standard linking interface makes it easy to combine assembly language subroutines.

Call 800-426-9400 to order the capable COBOL. $700.*

In Washington State, call 206-828-8088. Ask for operator F3, who will rush you your order, send you more information, or give you the name of your nearest dealer to see Microsoft COBOL in action.

*Price exclusive of handling and Washington State sales tax.

Micro tracks cancerous tumors at McGill

By Paul Gerstenzang
CW Staff

MONTREAL — A computer was a key tool leading to the recent discovery that cancerous tumors in advanced stages of growth fend off a body's defense mechanisms.

Dr. Peter Noble, a specialist in cancer research at McGill University here, found that certain white blood cells, which in many cases are attracted to and destroy cancer cells, are actually repelled by a chemical secreted by advanced cancer cells.

To observe cell movement, Noble used a microcomputer system from Electro-Optical Information Systems, Inc. (Eios) in Santa Monica, Calif. The microcomputer employs frame grabbing, a technique that transforms individual pictures into pixels. Graphics data is then fed into a series of Fortran programs, developed by an electrical engineer at McGill, that determines in which direction cells are moving.

This method of determining movement was pioneered by McGill University engineers. "We developed the first applications, which used time-lapse photography and the Markov Theorem to determine movement," Noble said. The Markov Theorem provides a model in which the probability of an event is dependent only on the event that precedes it.

"A student in the mathematics department was helping us apply the Markov Theorem," Noble said. "He approached Dr. Martin Levine, an electrical engineer, and asked him to write a program which would speed calculations.

"Originally, we were using a Digital Equipment Corp. VAX/11 superminicomputer. Last year, we switched to the Eios system." The Eios system uses an Intel Corp. 8086 microprocessor, Digital Research, Inc.'s CP/M 86 operating system and Eios frame-grabbing software.

"The program is designed to transform pictures into graphics data," said an Eios spokesman. "Since we customized the program, it is used by a number of different companies. We customized Dr. Noble's system so that it could use Fortran subroutines."

Noble bought an Eios system for $17,000 Canadian. "There were problems with the VAX system," Noble said. "We are located in a separate building, so communication was a problem. The VAX was expensive to own and operate and required extensive programming knowledge." In addition, he noted that a large number of users would tax the system's capacity to the point that the DP department's turnaround time for some programs was sometimes as long as one week. The Eios system allows for more rapid turnaround, he said.

A number of other researchers are using the system. "Since the system is easy to use, any biology student can use it," Noble said. "Before, it was used only by electrical engineers. I think it will be used for a number of research projects and also as a health care tool."

"Women and computers first!"

The TC-500A is available in 16- or 32-channel chassis configurations. 16-channel unit shown above.

COMDESIGN INTELLIGENT STATISTICAL MULTIPLEXERS

MORE FEATURES FOR YOUR COMMUNICATIONS DOLLAR

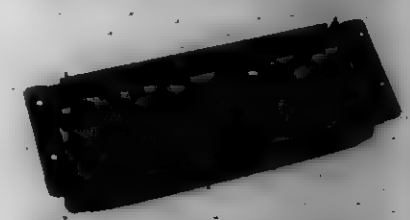
An attractive price and a long list of features make ComDesign's TC-500A Intelligent Statistical Multiplexer a great value. In fact, it would be hard to beat this multiplexer for data concentration, error control and throughput.

But that's not all.

The advanced intelligence of the TC-500A also gives you the complete system control you would expect only from an expensive network processor.

IT'S FLEXIBLE

Compatible with virtually any host computer, the TC-500A can connect up to 32 terminals, printers, personal computers, or other CPU's over one phone line.* With all the performance of a direct connection. Just select the exact channel configuration you need. The TC-500A supports all popular speeds, flow control conventions, and special character formats.



The TC-500A's unique firmware module, Flexpak, permits easy in-the-field software upgrades and access to latest ComDesign software releases.

*16 asynchronous or 16 synchronous and 4 asynchronous.

Free application engineering and support is available to all customers from ComDesign's highly-qualified "data comm doctors."

EASY TO USE

The TC-500A is also surprisingly user-friendly. For starters, you never have to flip DIP switches or figure out complicated codes. As a matter of fact, the TC-500A is menu driven, in plain English. All commands are simply entered via the convenient front panel or through the supervisory CRT.

A NETWORK CONTROL CENTER TOO

The TC-500A's multiple microprocessor based architecture makes it powerful enough for network control and management functions. From either end of the network, you can monitor and test the entire system or its individual components, perform complete reconfiguration or change any operating parameter.

And, should anything ever go wrong, the TC-500A's extensive self-diagnostic capabilities make it easy to pinpoint the problem and effect immediate corrective action.

Add it all up, and we think you will agree, that the TC-500A will give you more for today's *and* tomorrow's communications dollar.

Data base service available for job matching

By David Gosse
CW Staff

WEST PALM BEACH, Fla. — A data base service called Careersystem was started recently by Careersystem, Inc., a wholly owned subsidiary of General Database Technology, Inc. based here.

The service allows employers to match job requirements against the data base to find qualified job candidates, usually after no more than a 10- to 15-minute search, according to spokesman James Blakenship. Careersystem also enables individuals whose resumes are in the data base to be continually matched with jobs for which they may qualify.

The service is targeting jobs for professional, technical and middle-management personnel because "that's where the demand is," Blakenship said. Among the first companies to utilize the service are American Express Co., AT&T, Harcourt Brace Jovanovich, Inc. and Pratt & Whitney Aircraft.

The data base is accessed through Falco Data Products, Inc. TS1 CRT terminals provided by Careersystem to employers and employment services such as personnel agencies. The data base resides on a Tandem Computers, Inc. Nonstop II system, which has the capacity to store 837,000 career profiles per node and is expandable to 256 nodes.

The key to the service, Blakenship said, is the software, which permits users with the Falco terminals to search, match and communicate needed information. The program, called the General Database System, was developed by company Chairman Dale Learn, President William Berry and Senior Vice-President Philip Morgan, who also are the firm's co-founders.

The data base is composed of career profiles that include information such as an individual's career objective, work experience, education background and current and preferred salary level.

There is no fee for individuals who want their career profiles listed in the data base.

A company or employment service must pay a $150 monthly fee for the terminal connection to the data base. There also is a $2/min. connect-time charge.

For each qualified candidate the employment recruiter locates, employers must pay a $20 charge for receiving an information packet about that person.

Careersystem is located at 1675 Palm Beach Lake Blvd., West Palm Beach, Fla. 33401.

Deltak series designed for non-DPer

NAPERVILLE, Ill. — A 15-course multimedia training series to provide non-DP personnel with a basic understanding of computer-based systems and their applications is available from Deltak, Inc.

Titled "Computers at Work: Concepts and Applications," the series explains the history of computers and their applications. Videotapes in the series feature interviews with data processing professionals and end users.

The individual programs in the series, produced by Mitchell Publishing, Inc., can be rented or purchased. Rental fees range from $50 to $125 per course, depending on volume. Courses can be purchased for $1,750 each.

More information is available from Deltak, Inc., East/West Technological Center, 1751 W. Diehl Road, Naperville, Ill. 60566.

Health firm improves care with automation

By Lynn Haber
CW Staff

AUSTIN, Texas — A hospital development and management company here relies heavily upon automation to help make decisions at its headquarters and to improve patient care at its 12 facilities nationwide.

Automation at Healthcare International began in the fall of 1980, when its first computer, an IBM System/34, was installed at one of the company's hospitals in Memphis.

In the fall of 1981, two more IBM systems were installed, one in the corporate office and one in a Houston-based hospital. Soon after that, seven more systems were installed, and two more were scheduled to be installed in January 1984.

"We've had a pretty big growth rate," Don Landrum, Healthcare's director of information systems, noted. "Presently, we're evaluating an IBM System/36 for our larger hospitals. We're constantly upgrading."

The company also uses IBM 5520 word processing systems at the corporate office and IBM Displaywriters at all of the hospital facilities. In all, the company has about 65 workstations.

"On our IBM System/34, we're running all the basic applications — accounts payable, ledger, payroll and fixed assets. We also have a financial reporting system that we've written in-house and a consolidation reporting system," Landrum said. "But our most unique application is our referral system."

Admittance inquiries

When someone inquires about admittance to one of Healthcare's hospitals, an employee records information about the patient on a terminal.

"We use our referral system for tracking where the patient is calling from, what part of the country he's interested in and what his problem is," Landrum said.

"We also note whether we admitted the patient to one of the company's hospitals or why we didn't — for example, was it because we don't treat that particular type of disorder?

"We hope that in two to three years we'll have enough of a data base built on that type of information that we can use it to decide where better markets are to be found or for research and development types of applications."

Referral system

The referral system has only been in operation for a year. "We're in the beginning stages of building our patient data base, so it will be a couple of years before we can use it as a tool the way we would like to," Landrum said.

The company would also like to use the stored information to decide whether new programs or medical equipment should be added to match the needs of potential patients.

Healthcare International started out 40 years ago as a hospital development company for a family-owned business and changed management and ownership in 1980.

To every software developer who'd written off portability as an impossible dream, Digital Research humbly announces a few monumental breakthroughs.

We not only offer languages that are portable from 8 to 16 to the 32-bit chips of the future, they're portable across all popular operating systems, too. What's more, we supply the broadest range of quality languages and development tools available today. And will tomorrow.

So rest assured. Whether you design applications at a major corporation, plan to become a major corporation or just qualify as a hobbyist, you only have to write it once.

Simply pick the Digital Research language that's right for you. From Personal BASIC™ to Digital Research FORTRAN-77.™ The newest member of our remarkable family.

To complement languages, we offer a complete workshop of development tools. Our Display Manager™ and Access Manager™ simplify the design of screen displays and data bases. So you spend less time and effort.

If you write in COBOL, our Animator™ source level debugger will get your software running in record time.

And for programmers skilled with IBM mainframe SPF, we offer micro/SPF.™ An editor that helps turn your invaluable experience into valuable new software applications.

At Digital Research, we work as hard for you after the sale as we do to get the sale. With backup like quality documentation, software updates and a phone line to our technical support team.

With so much productivity and service to draw on, it's small wonder IBM chose our languages for its IBM® PC, XT and the new IBM 3270/PC.

For more information, call your IBM representative.

Three suspended for tapping school's system

By Patricia Keefe
CW Staff

SAN DIEGO — A series of break-ins into the computer system at a specialized math and science high school here last month has resulted in the suspension of three students and a beefing up of system security.

Officials of the San Diego School Department and Gompers Secondary School decided against filing criminal charges with local police, even though four students allegedly deleted grades and altered other students' homework filed on the school's Digital Equipment Corp. minicomputer system.

Initially, the students confined their activities to changing passwords so teachers couldn't access their programs. No data was lost, however, because the teachers had maintained hard-copy backup, according to Albert Cook, the assistant superintendent of schools here.

Although Gompers officials are reportedly now planning to educate students and their parents about the ethics and legalities of system violations, Cook said new students are regularly given an orientation regarding the ethics of computer science, including tampering.

Three of the students involved attended Gompers, while a fourth attended Patrick Henry High School, which also has a computer science program. Three of these students have been suspended from the computer science program for the remainder of the year, Cook said.

Their activities were discovered after the chairman of the Gompers computer science program realized that phone lines used by students to do computer science homework at night were being used during the day. After setting up a monitoring system, the chairman learned that a student at another school, using information supplied by his brother at Gompers, figured out the passwords needed for full access to the Gompers computer system. The two brothers then circulated the passwords among other students.

School officials still aren't sure how many students ended up with the ability to access the system. Although the students claimed the passwords were relatively simple, the teachers say the students were extremely lucky to have guessed them, Cook said. The only security precautions the school can take, according to John Crane, director of DP for the San Diego schools, is to change the passwords, which has been done. There is no need for anything more since the Gompers system is not connected to any school administration computers, he added.

Fill in your IBM micro/mainframe communications picture.

AST Research, the leader in IBM PC enhancement products, brightens your micro/mainframe communications picture with a full palette of economical, integrated hardware/software masterpieces. With AST Products, you can emulate IBM terminals or create PC-based Local Area Networks.

AST improves your office operating cost picture.

AST communications products give your IBM PC the flexibility to act as a terminal for your host system or as a stand-alone computer for smaller tasks. Your PC won't bog down the mainframe with unnecessary small jobs and local computing on the PC eliminates phone line charges too. Get the power of a mainframe when you need it and personal computer convenience right at your fingertips.

Applications solutions that are strokes of genius.

AST keeps pace with your ever-changing applications requirements with reliable, high quality, cost effective communications products. AST products provide support for Bisync and SNA/SDLC communications protocols as well as networking multiple PCs for sharing resources.

Choose AST products — by the numbers.

These AST communications packages are currently available:

1. AST-SNA™ emulates a 3274/3276 controller and 3278 or 3279 display terminal using SDLC protocol.
2. AST-BSC™ emulates 2770 batch RJE and remote 3270 display terminals using 3270 Bisync protocol.
3. AST-PCOX™ allows your PC to connect to an IBM 3274/3276 cluster controller via coax cable and emulates a 3278 or 3279 display terminal.
4. AST-3780™ emulates 2770, 2780, 3741, and 3780 RJE workstations using Bisync protocol.
5. AST-5251™ emulates a 5251 Model 12 remote workstation connected to an IBM System 34, 36 or 38.
6. PCnet™ is the first Local Area Network designed specifically for the IBM PC or XT and the PC-DOS 1.1 or 2.0 operating system.
7. CC-285™ is a user-programmable dual-port card capable of communicating in Async, Bisync, SDLC, or HDLC protocols.

Discover how well AST can fill in your micro/mainframe communications picture. For descriptive data sheets, write or call: AST Research Inc., 2121 Alton Ave., Irvine, CA 92714. (714) 863-1333. TWX: 230370ASTRUR

EFT expo set for April 1-4

ORLANDO, Fla. — Robert B. Gill, vice-chairman of the board of J.C. Penney Co., will keynote the opening general session of the Electronic Funds Trainafer (EFT) Association's annual convention and exposition. The EFT expo will be held April 1-4 here at the Hyatt Regency Grand Cypress Hotel.

The conference program this year will include sessions devoted to point-of-sale systems, automated teller networks, home financial services, automated clearinghouse services, EFT operations, technology issues and marketing opportunities.

The registration fee is $495 for members and $625 for nonmembers. Information is available from 1029 Vermont Ave. N.W., Washington, D.C. 20005.

System to aid five cities pinpoint likely arson targets

By David Gleave
CW Staff

QUINCY, Mass. — Fire departments in five U.S. cities will soon be enlisting the aid of computers to help pinpoint buildings that are likely targets of arsonists.

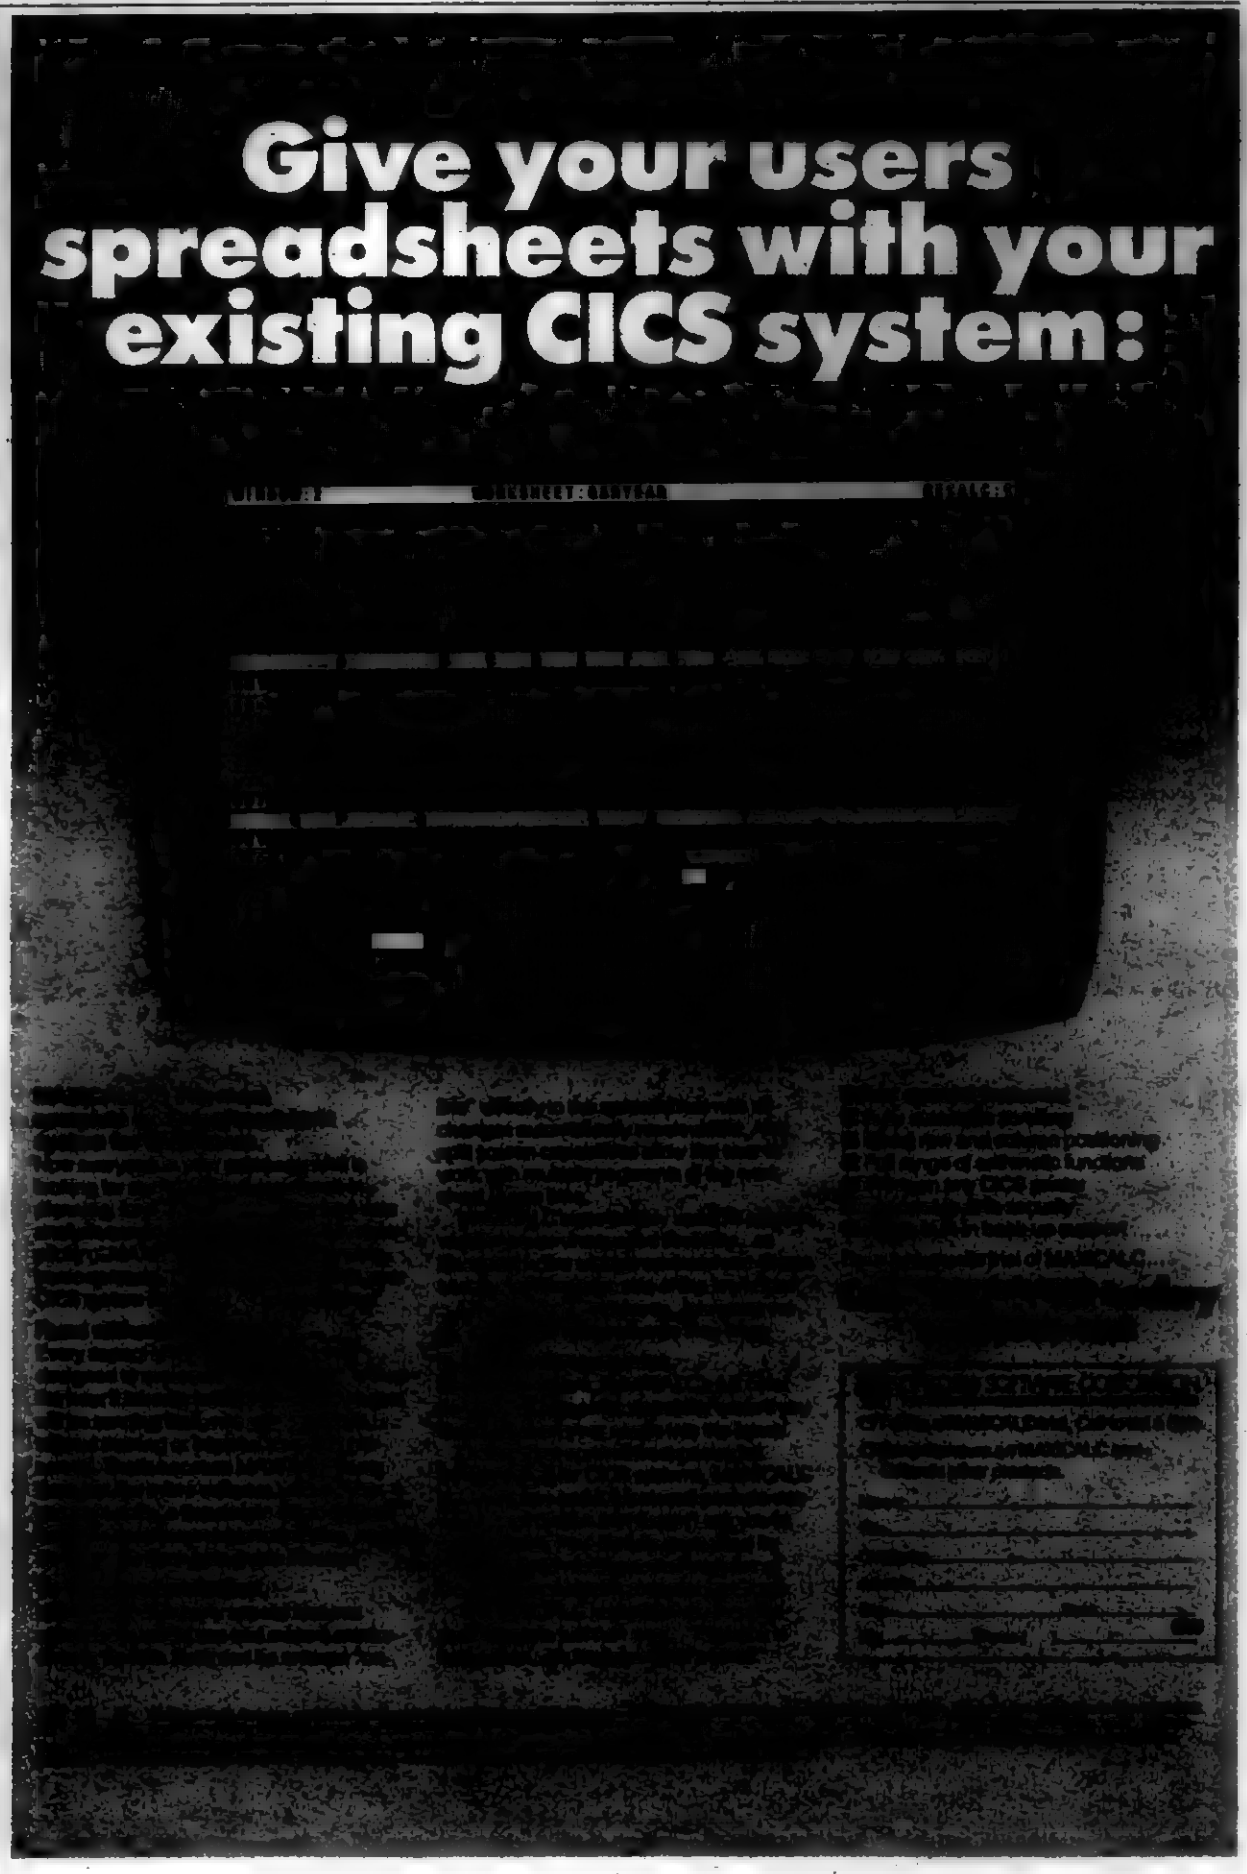
The Neighborhood Arson Information Management System will be operating in arson-prone areas in Dayton, Ohio; Kansas City, Mo.; Louisville, Ky.; Oakland, Calif.; and Providence, R.I. The Ford Foundation has awarded $501,000 in grants to organizations in those cities to carry out the program.

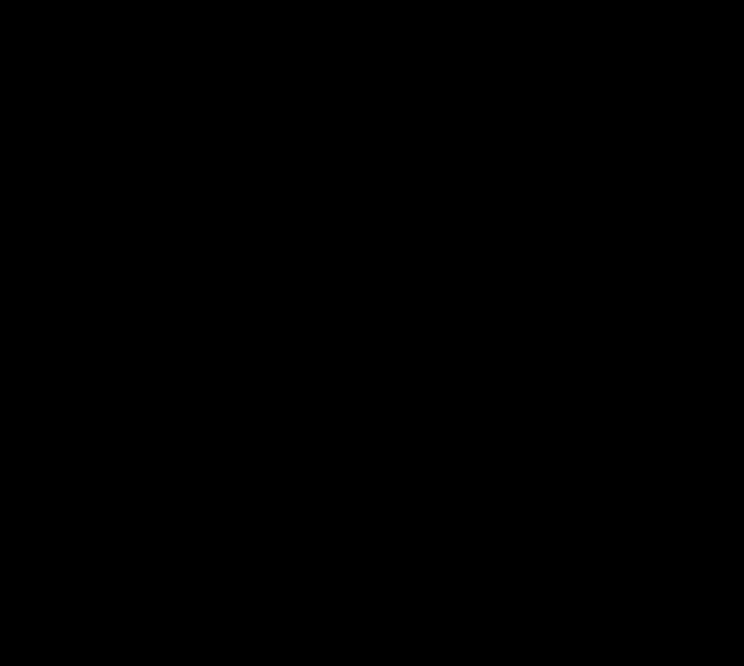
The National Fire Protection Association (NFPA), a Quincy, Mass.-based nonprofit organization, is spearheading the two-year program.

The Neighborhood Arson Information Management System is built around a software program designed by Marmen Computing, Inc., a Menominee, Mich., software company. Using criteria developed by the NFPA, Marmen developed an application for Ashton-Tate's Dbase II data base management program.

Several insurance groups contributed a total of about $45,000 to supply each of the participating cities with a Compaq Computer Corp. microcomputer and an Okidata Corp. Microline 92 printer.

Arson prevention programs in Boston, New York and New Haven, Conn., have used common indicators to develop detailed computer profiles of likely arson targets. Some of those indicators are tax arrearage, insurance policy information and a history of building code violations and fires of suspicious origin.





1. A full line of software!
2. Ribbons, paper, and supplies of every description!
3. Rental, leasing, and purchase plans for every need!

DATABASE SOFTWARE FOR DIRECT MARKETING.

PHONE (617) 235-2600

Originally created for high-volume Club/Continuity and Catalog mail order companies throughout Europe, the Advanced Direct Marketing System became available in the United States last year.

After a decade of fine-tuning by European businesses, ADMS controls the more complex aspects of mail order operations easily, and solves troublesome Club Plan problems just as effectively.

It is an extraordinarily powerful, IBM-based software system that is multi-faceted, flexible, and capable of troublefree growth as your mail order business diversifies and expands.

ADMS is not for everyone, though, because it is not cheap. But then, cheap is usually expensive for fast-growing mail order businesses in the U.S.

'Journal' to retire typewriters, move on-line

By Edward Warner
CW Staff

NEW YORK — The clattering of typewriters has almost completely died away in the newsroom of *The Wall Street Journal*, one of the nation's most traditional newspapers and one of the last to convert to electronic text management.

In a year or two, the last of the typewriters will be retired, as Dow Jones Co., owner of the *Journal* and *Barron's* magazine, completes the switch to a fully electronic newsroom. That transition took another step forward last month with the announcement by Dow Jones that it would purchase $8.8 million worth of electronic pagination equipment from Information International, Inc. of Culver City, Calif.

The pagination equipment won't send any of the *Journal's* IBM Selectrics or Olympia USA, Inc. manuals to the closet, but it will eliminate the painstaking chore of page composition, in which the long columns of copy for which the *Journal* is known and all photographs and advertisements are pasted onto paper sheets that later become the printing plates for the *Journal's* pages.

The *Journal's* transition to word processing got a boost last year with the introduction of 75 Radio Shack TRS-80 Model 100 transportable microcomputers for the 100 reporters in the New York bureau, largest of the paper's 26 bureaus worldwide. Some typewriters still remain there, but in the words of one editor, Jim Hyatt, "Most everybody has begun using the [Radio Shack] machines."

To date, though, only about 250 of the machines have been supplied to the *Journal's* 450 reporters, editors and copyreaders worldwide; most of the others use typewriters. Dow Jones, according to the director of its operating services group, Kim Breese, recognizes the limitations of the machines — their LCD screen is relatively small, for example — and is seeking another system for its far-flung news staff, a system expected to cost as much as $8 million to $10 million. A vendor for that system will be chosen in the next six months, Breese said, and delivery of the desktop terminals and associated equipment should take place within one to two years.

Breese said Dow Jones was forced to "sort of drag our feet" on the move to full electronic text management and decided to go that route only two or three years ago. A slow pace was needed, he explained, because of the difficulty finding equipment that could meet the paper's specialized production needs. The *Journal* has printing facilities in five different U.S. locations and computer centers for text production both in Dallas and in Chicopee, Mass. All are linked via satellite.

Using the newly ordered pagination equipment, which won't be online until sometime early next year, editors will be able to design news pages on the screens of desktop terminals. Finished page designs, complete with headlines, photos and advertisements, will then go to the *Journal's* existing laser scanner, which will broadcast them to the paper's production facilities, according to Kevin Howard, manager of media and public relations for Information International.

"What's coming in hasn't been done before," Howard boasted. "Our system, once it's up and running, will be the most complex in the newspaper industry." Currently only one newspaper in the U.S. produces printing plates for its press run directly from the page designs drawn by editors on their VDTs, Howard said, and that system is still only in the testing stages. The Information International system will go that technology one better, he added, by linking with the *Journal's* satellite transmission equipment.

Meanwhile, in New York, the *Journal's* assistant wire room supervisor said acceptance of the new technology has been very high among the paper's news staff, though. "There are a few die-hard old timers who don't like to go to the new system."

As for Hyatt, he's keeping all of his bases covered: He has a Data Data Systems Corp. editing terminal, a Radio Shack Model 100 and a manual typewriter, all on his desk.

Sobol to keynote Compacs March 20

LONDON — Michael I. Sobol, president of the MIS Training Institute, Inc., will be the keynote speaker at the eighth annual European Forum on Computer Audit, Control & Security (Compacs), which will be held here March 20-23.

Sobol, a computer audit consultant, will speak on the role of computer auditors.

Conference registration information is available from Compacs '84, IIA-UK, 82a Portland Place, London, England W1N 3DH.

WILL THE AT&T BREAKUP MEAN AN MIS SHAKEUP?

You'll know, when you view "DIVESTITURE: IMPACT ON INFORMATION MANAGEMENT" Exclusively from DELTAK's Special Edition: Computerworld Reports.

The AT&T divestiture is undoubtedly the most earth-shaking event in recent business history. The repercussions will be felt throughout the telecommunications industry for many years to come. It will also profoundly change the way your company processes all forms of information. That's why you owe it to yourself to watch "Divestiture: Impact on Information Management," an up-to-the-minute half-hour video cassette report presented by DELTAK and CW Communications.

This month, you'll enjoy the invaluable insights of a respected communications consultant, and a major communications vendor whose company may benefit from the recent breakup. Your program host is John Gantz, noted MIS author and contributing editor of INFOWORLD magazine.

And be sure to keep watching, because more hard-hitting issues of Computerworld Reports such as DP/Office Automation Integration and The Maturing Information Center will be coming in the months ahead. Or, previously released Reports addressing major issues are still available including: The MicroMainframe Link, Integrated Microcomputer Software and Managing the Communication Network.

Remember, before the Big Breakup shakes your information system up, order "Divestiture: Impact on Information Management." Call DELTAK order entry at (312) 369-3000; (416) 678-9222 in Canada.

Speaker urges retraining in switch to OA

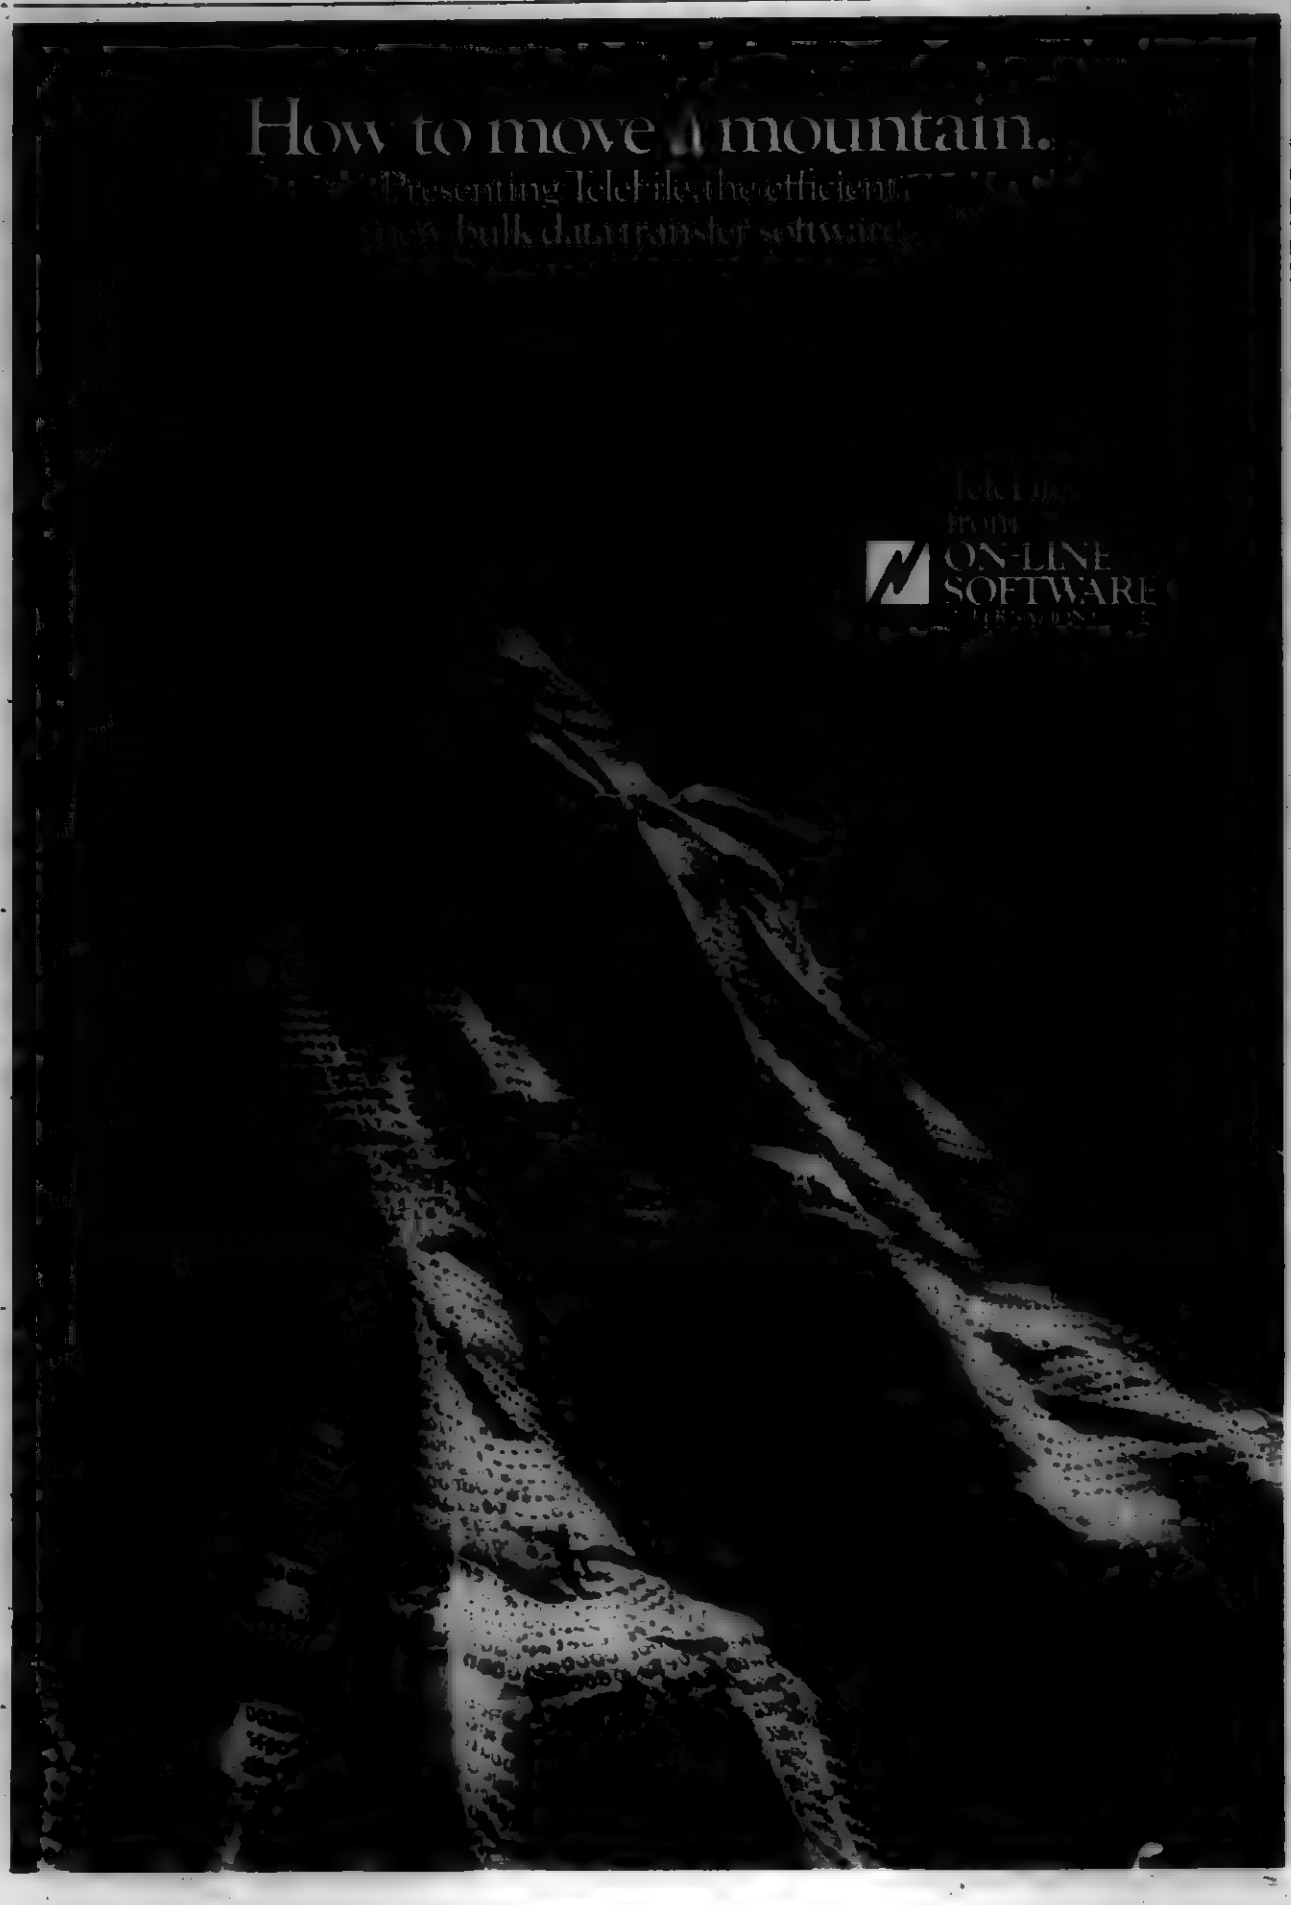
By Robert Batt
CW West Coast Bureau

LOS ANGELES — Data processing analysts are in the best position to deal with the office automation needs of their organizations, but radical retraining is required if they are to become effective.

This was the message delivered to OA specialists at the recent 1984 Office Automation Conference (OAC '84), sponsored by The American Federation of Information Processing Societies, Inc. (Afips).

Speaking at a conference session titled "Turning a Data Processing Analyst Into an Office Automation Analyst," Nigel Harrison, director of System Concepts Ltd., a London-based concern, said that while people with the right skills and experience to develop successful office systems are rare, most organizations have analysts and designers on their staffs with many of the right attributes.

"The aptitude of the DP professional for analytical thinking and problem solving needs to be refocused for office systems, but his basic skills in this area give him a head start on many of his colleagues," Harrison asserted.



In retraining DP specialists for office systems work, Harrison said it is important for DP specialists to look at office systems from a user's point of view and not bring a preconceived technical solution to problems.

"The DP analyst needs to develop office automation analysis skills. He will need to take into account all the different views in the office, or any proposed system will fail," Harrison warned.

In terms of objectives, he added, data processing traditionally tends to be concerned with improving the basic efficiency of an organization — seeking better ways to do existing jobs.

By contrast, office systems will be concerned much more with improving the effectiveness of the organization by seeking ways to do new jobs.

"Office systems will affect many people and will therefore make human and behavioral issues a central and critical aspect of their introduction," Harrison said.

OA analyst's function

The function of an OA analyst is to understand a business system rather than a technical system. It is therefore imperative that DPers working with office systems understand the business activity of the organization.

A detailed set of analysis skills are needed to perform office systems work effectively, he contended.

"The skills needed to implement office systems successfully will be different from those needed to implement DP systems.

"Office systems will involve broader and often new development skills, with an emphasis on the analysis and implementation aspects. In addition, organizations will need to bring together many of the technology skills they already possess, but which are presently dispersed throughout the organization," he maintained.

Also speaking at the session, Pat Macauley, manager at Trigon Systems Group, Toronto, focused on the prerequisites needed to design an appropriate office system:

- A pilot project must be set up so that it leads to a permanent system.
- Users must contribute significantly to the project by gathering and analyzing data and by being actively involved in implementation.
- There must be visible management support for new office systems, and managers themselves should be seen using the system.
- Response time, accessibility and reliability are critical to the success of an office system.

On-line data system tracks railroad's cargo

PHILADELPHIA — The Consolidated Rail Corp. (Conrail) runs about 2,500 freight trains each day and must manage about 225,000 individual freight cars. Keeping daily track of its rolling stock and individual cargoes led to the evolution of an extensive computerized management system.

A 1976 act of the U.S. Congress formed Conrail with the merger of six bankrupt rail carriers. One of the five largest U.S. railroads, Conrail operates about 15,000 route miles in 15 states, the District of Columbia and two Canadian provinces.

In 1982, Conrail began implementing an extensive on-line data system network known as the Resource Management System (RMS). The system includes more than 60 IBM 8100 computers distributed throughout Conrail's routing structure. Using about 2,500 IBM terminals, employees perform two primary functions — processing customer shipping orders (waybills) and monitoring freight as it moves from destination to destination.

The first 8100 was installed in Allentown, Pa. "It took us about four to five months to get out of there and get to the second one," said John Green, Conrail's director of Transportation Systems.

With installations of 8100s and satellites at a total of 300 locations, "we started in earnest in the summer of 1982 and put the last unit in during November of 1983," he said. Additional resources for training would have speeded up that process somewhat, he said.

Repetitive code

One key benefit of the 8100 system is the development of the Repetitive Waybill Code (RWC). The RWC is a code assigned to a specific pattern which occurs when the same customer ships the same commodity to the same location a number of times. Conrail employees enter the 10-digit RWC, the car initials, the car number, the waybill number and the date. All other information (the origin, the destination, the commodity, etc.) can be automatically generated from the RWC.

When an employee makes an inquiry for an RWC, the file of the local 8100 is searched. If the code is not found, the request is relayed to the central data processing host in Philadelphia, an IBM 3081 operating under CICS. The network is managed using IBM's Team.

"Once you get a central system established, it's more of an evolution than a revolution," Green said. Conrail's central data processing was started with an IBM 370/155 in the mid-1970s; the next step in the evolution was an IBM 3033, which gave way to the 3081 last spring.

Approximately 90% of the RWC retrieval is done at the local level with the 8100. This provides two benefits — rapid response time and stand-alone capability. If the communication link to the central system is broken or the central system is down, the local sites still can perform their waybill functions.

The principal equipment for these functions are 56 IBM 8100s operating under IBM's DPCX software. The 8100s are each configured as a central machine and serve approximately 180 satellite (communication links) locations. Thus, the mainframe can be located in one location, but a satellite can be located 50 or 100 miles away in another railyard.

"It used to take three minutes to generate a waybill," Green said. "Now a waybill can be generated in under a minute."

The end product: a hard-copy waybill, an IBM card which represents the car as it moves across the railroad and shipment data which is concurrently transmitted to the central files as it's entered.

Another part of Conrail's Resource Management System is the car management center. In all, there are six car management centers, each one equipped with an 8100 operating under IBM's DPPX software. The centers perform an order matching function, taking the requirements of the customer for a loaded car and matching it with the available freight cars.

The management centers receive approximately 5,000 requests a day. The car management function takes the data which has been generated by the other 8100s and sends it to the host processor.

The goal is for the car-ordering center not to wait to assign the car to an order before it has arrived at its destination. It is an effort on Conrail's part to cut down on the distance a freight car travels empty.

During the course of a day, Conrail's central data system processes about 180,000 transactions, Green said. Every time a message is entered on one of the local 8100s, the central file is updated. Having the central files updated on a regular basis provides Conrail and its customers with quicker, more reliable service.

"The customer is satisfied and we're saving money," Green said. "In my eyes, that's a tough combination to beat."

New from Interactive Systems/3M:

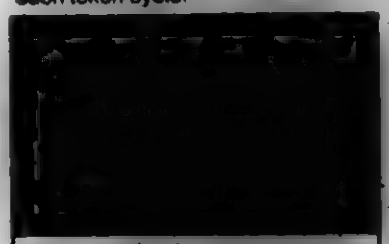
The first high-speed broadband local-area network that guards against data crashes.

If you've been thinking of investing in a contention network, consider this: How do you guard against data crashes during times of heavy system use?

Answer: You don't, because contention schemes simply don't provide any kind of data insurance.

Fortunately, there is a new type of network that does protect against data loss. It's called 3M Videodata® LAN/1. And it's the first intelligent broadband local-area network that's designed to get data through on time, no matter how much traffic is on the cable.

Videodata® LAN/1: The efficiency of token-passing plus the proven flexibility and expandability of broadband.
Token-passing networks eliminate contention troubles and data crashes by passing an electronic "token" from terminal to terminal. When a terminal has to transmit, it grabs the token and sends data packets to the receiving device. Receipt is acknowledged and the token is automatically released to continue its rounds. Because the system assigns a network entry address to each user, everyone has an opportunity to send data during each token cycle.



Because Videodata LAN/1 is a broadband system, dedicated channels can be used for full-motion video applications such as CAD/CAM and teleconferencing. These video signals are kept entirely separate from digital traffic on the network's token-passing channels.

So far, so good. But most token-passing networks are baseband systems, meaning that terminals must share a common channel as they would in a typical contention network. This can limit speed and capacity in some applications.

LAN/1 overcomes this possible limitation by combining token-passing with a proven broadband technology that allows many channels to be put on a single cable. The payoff: higher channel speeds, ranging up to 2.5 MB/s over a maximum seven-mile radius, with terminal data rates of up to 19.2 KB/s. Plus a capacity of up to 10,000 devices to allow plenty of room for future expansion.

In the Videodata LAN/1 network, messages can be sent from any terminal to any other without going through the host processor. Network Interface Units (NIUs) connect digital devices to mechanical taps (shown as small circles) on the main coaxial cable. A Network Monitoring Unit, or NMU, keeps a statistical record of network performance.

Self-monitoring, with a printed record of network performance.
LAN/1 gives statistical proof of its own performance in printed form, thanks to a microcomputer-based Network Monitoring Unit (NMU). This unit, which also helps in routine maintenance and troubleshooting, may be used for remote monitoring as well.

Separate channels for voice, video, and graphics. Plus the ability to work in point-to-point applications.
Because LAN/1 is a broadband network, channels can be set aside for real-time voice, video, and high-speed graphics. This can be done without compromising digital traffic capacity.

LAN/1's broadband design also permits flexibility in network architecture, so that it can be used in high-speed point-to-point applications which can't be served efficiently with contention systems.

Other benefits include full transparency, an automatic shut-off feature to keep any one terminal from capturing the token, and compatibility with both dumb and intelligent terminals. The list of features goes on and on.

For the full story on the new Videodata LAN/1 network from Interactive Systems/3M, call 800-328-1684 toll-free. (In Minnesota, 800-792-1072.) Or mail the coupon.

NEWS

TURNAROUND TIME
Larry Long

Q The two people in our newly established information center and 30 programmers report to me. I'm comfortable with managing programmers, but have not fared well with the two people in the information center.

Our information center has five micros and eventually will have several terminals. Having no experience in this area, I didn't know whom to hire, so I recruited one person from corporate training and the other from my programming staff.

I thought that would be the perfect combination, but I've had nothing but complaints. The programmer tries to impress people, and the trainer simply can't answer questions about the hardware or software.

What type of background is best for persons working in information centers?

A It seems as if there are a dozen concepts for information centers. I see an information center as a place that has the tools to help users help themselves. These tools include hardware, software, technical support and education.

To date, no credentials package has emerged for information center personnel. In your environment, you must have people with a solid technical base who can use and explain the use of available tools. They can come from either MIS or the user community.

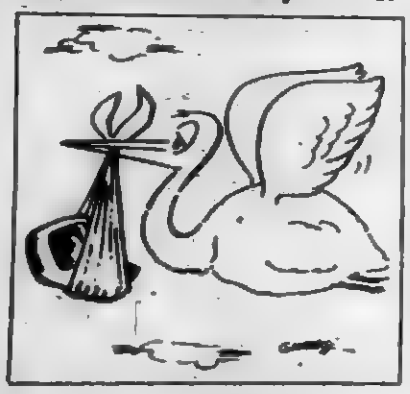
After technical competence, you can look for certain desirable personality traits. The person working directly with users must genuinely want them to learn so that they can eventually work independently. He must have patience and recognize that the users are not going to learn in one hour something that took him years to learn.

A common failing in information centers is that support personnel would rather just do the work than show users how to do it themselves. In the long run, this is counterproductive.

Q I've worked in technical systems for the past five years and have spent much of the past year learning about and installing local-area networks. My boss has asked me to prepare and present a one-day, in-house seminar on local networks.

My longest presentation to date was 10 minutes, and, frankly, I don't know where to start. Do you have any suggestion on effective presentation?

A Let me highlight a few key considerations. Prepare a detailed outline of the entire seminar for yourself, then condense it to a one- or two-page handout. The act of preparing an outline causes you to crystalize your subject material into a logical sequence, and it gives the attendees a "road map" to follow.



Prepare examples that illustrate key points. You can't have too many examples.

People not accustomed to speaking tend to underestimate the time required to present material. If you think that it will take 30 minutes, plan on an hour and you will be about right.

You will know local nets better than anyone attending, so exhibit confidence from the start. There is always at least one person who will attack at the first sign of instability. This person is more concerned about making you look bad than learning about local nets. Confidence is your best retort to this person.

Allow time for interaction, but never permit the discussion to drift away from the central focus of the seminar. As the seminar leader, you are responsible for directing the discussion. If you don't intervene, you may find the group talking about basketball rather than local nets.

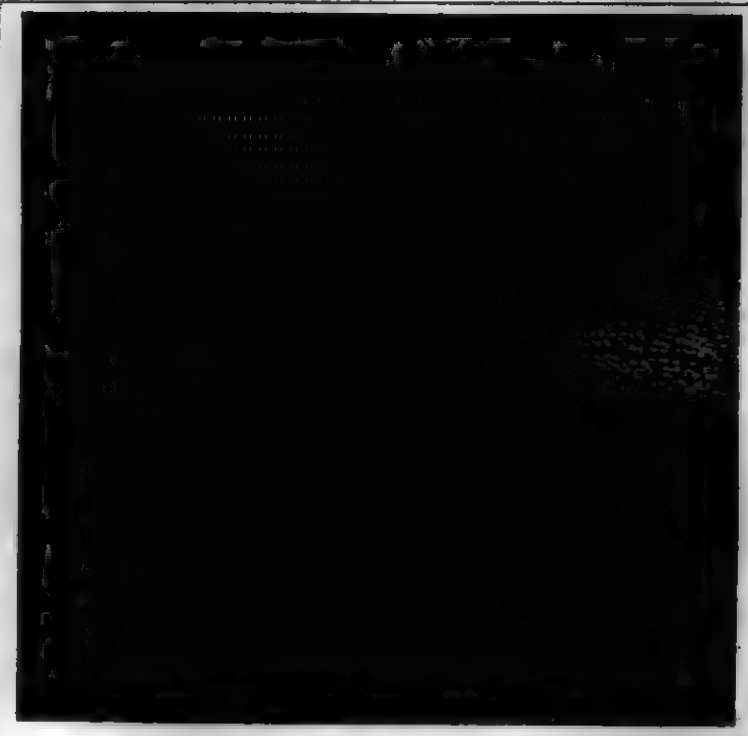
Above all, have fun. If you appear to enjoy giving the presentation, then others will enjoy attending.

Q I'll graduate from college in June and eventually hope to work in the DP field. I'm considering graduate school, but my adviser suggested that I get a job and devote my energies to working for a few years, then return to graduate school full time. I would appreciate your input.

A Students often ask me whether they should stay for a master's degree or go to work. My response differs from one person to the next based on the individual's level of maturity, continued enthusiasm for academic work, the institution he wants to attend and other factors.

If your adviser knows you and your circumstances well, you have probably been given some sound advice.

Long, president of Long and Associates, is a consultant, lecturer and author in the field of information services. If you have a question you'd like him to address, send it to Larry Long, Editorial Department, Computerworld, P.O. Box 880, Framingham, Mass. 01701.



Whether you're looking for Payroll, Personnel, Pension Administration or Claims Processing software, Information Science's "Whole Person" software gives you a comprehensive system that provides superior technical features.

Systems for both Database and Non-Database

InSci's state-of-the-art payroll/personnel database system is integrated into a number of database management environments–including IMS, DL-1, and IDMS. Native mode, the system is designed to take full advantage of each specific database structure, eliminating clumsy, resource-draining interface programs.

In addition, InSci offers two non-database systems. One using a sequential file structure, the other using a VSAM access method.

Realtor hones analyses with financial modeler

By Paul Korzeniowski
CW Staff

NEW YORK — Pan American Properties, a real estate, farming, and forestry company here, realized that using Hewlett-Packard Co. calculators for financial modeling was not the best method of determining the feasibility of multi-million-dollar purchases.

"When we evaluated the purchase of a corporate office, we used calculators to help arrive at profit-and-loss estimates," said Bernard Ross, data-processing manager. "We could calculate information for 200 different leases, but we were unable to integrate that data so it would be meaningful."

To alleviate the situation, Pan American began evaluating financial modeling products that would run on the company's IBM System/34 minicomputer.

"The package had to complete conditional programming, set limited parameters and handle GOTO subroutines," Ross said. "Most modeling packages were not sophisticated enough to meet our needs."

Pan American needed sophisticated programming, but it lacked an experienced programmer. "We were leery of developing the initial program," Ross said. "It was complicated, and we didn't have anyone with programming experience."

Business Model Systems, Inc. in Oak Brook, Ill., agreed to design the initial package with one condition: If the program did not meet Pan American's standards, the company could return Business Modeler, a $12,000 interactive financial modeling package.

"They developed a complicated real estate property program, which included conditional loops and other utilities," Ross said. Pan American's acquisition department now uses the system to integrate information from all leases, identify market rates and calculate probabilities of tenants moving.

"If our purchasing analysis accuracy increases by 1%, the system would pay for itself," Ross said.

As Ross gained programming experience, he transformed the initial program into a complete system. "We expanded the program so that it acts as a miniature data base," Ross said. "We used an RPG program to connect the data files from the accounting and acquisition departments. The system produces special reports that each department uses. We have a more complete picture of our operation.

"Our California office has an IBM Personal Computer XT," Ross said. "With an [IBM 5251] Model 12 terminal emulator, it can use the modeling analysis capabilities."

TI users meet set for March

AUSTIN, Texas — A meeting of Texas Instruments, Inc. computer users, the TI-MIX 1984 International Symposium and Exhibition, is scheduled for March 25-28 at the Opryland Hotel in Nashville.

The sponsor has scheduled 29 sessions on hardware, languages, software, applications, management and marketing relating to TI products.

At-the-door registration for the full symposium costs $190 for TI-MIX members and $205 for nonmembers. One-day registration costs $80 for members and $95 for nonmembers.

Further information is available from TI-MIX 1984 Symposium, P.O. Box 2909, M/S 2200, Austin, Texas 78769.

able. InSci started the HRS industry back in 1965, and we've led the field ever since. Our technical experts have provided you features unmatched by any other company.

Modularized Design For Easy Maintenance. InSci "Whole Person" software was designed from the top down and is highly modularized, providing maximum flexibility. A single module or subroutine supports each specific function in the system.

User Exit Routines. Strategic areas built into the InSci system allow exits to override the standard system routines. This means you can add your own programs without changing database system codes. InSci also gives you source codes so you can go into the system directly if you desire and still receive maintenance.

Payroll

Claims

Preliminary or final processing mode. InSci systems let you select the most efficient operating mode for each processing task. All changes can be processed in real-time, so they become effective immediately. Preliminary processing allows for simulating situations such as a payroll run without affecting the database. And, of course, InSci systems provide state-of-the-art security precautions, complete maintenance support and training.

3274 SYSTEM FROM ALONG.

IBM 3274 system users no longer have to pull individual cables each time they add or relocate terminals.

The Codex Cable Mux provides transparent, high speed communications for up to 32 terminals through one single cable. It saves you money and offers unlimited flexibility in setting up terminal clusters throughout your entire organization.

The Codex Cable Mux also offers a variety of purchase and service options no other vendor can match.

Like the opportunity to lease a unit for as little as $26 a month.

And a choice of on-site or back-to-the-factory maintenance.

For more information about Codex's Cable Mux, call 1-800-821-7700 ext 888. Or write: Codex Corporation, Dept. 707-88, 20 Cabot Blvd. Mansfield, MA 02048.

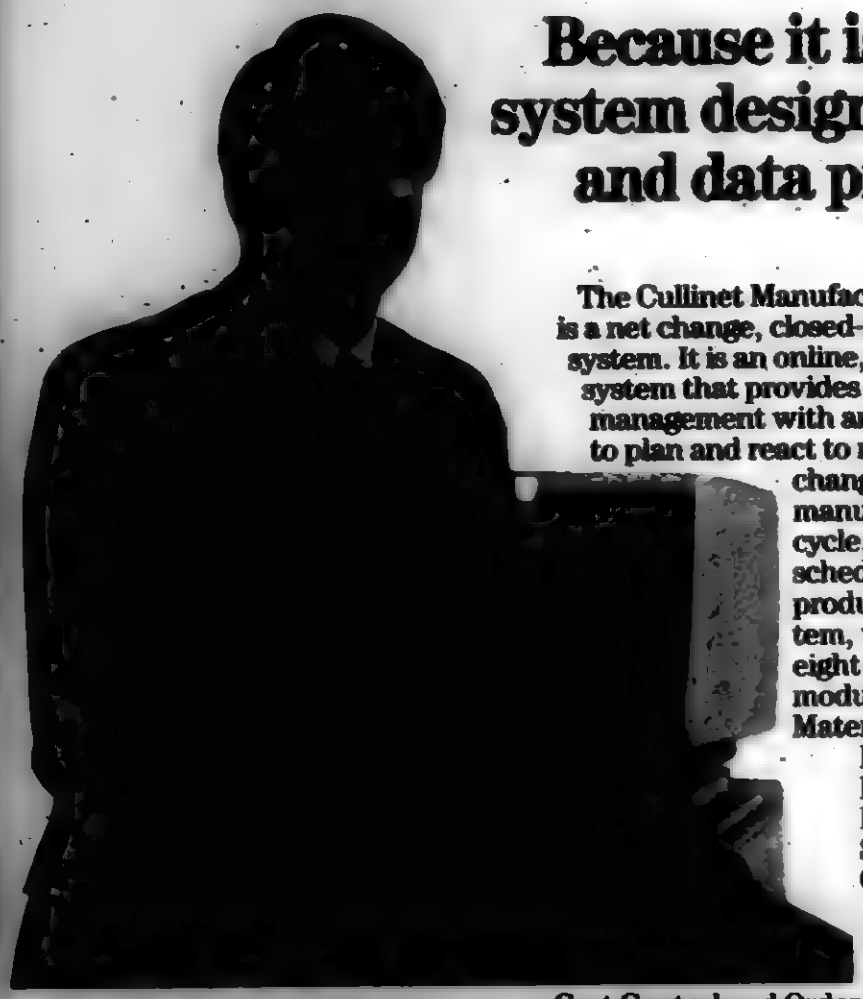
"The Cullinet Manufacturing System is a major advance in application software technology."

—Fred Buckley*



Because it is the first manufacturing system designed for both manufacturing and data processing professionals.

The Cullinet Manufacturing System is a net change, closed-loop MRP II system. It is an online, interactive system that provides manufacturing management with an effective way to plan and react to real world changes in the manufacturing cycle, from master schedule to finished product. The system, which includes eight functional modules: Bill of Materials, Material Requirements Planning, Inventory, Shop Floor Control, Master Production Scheduling, Purchasing, Cost Control and Order Entry, provides a new level of control that can dramatically increase productivity.

This level of control is made possible through the Cullinet Manufacturing System's unique horizontal and vertical integration with Cullinet's Database Software.

Horizontal integration means that all manufacturing data is controlled and accessed directly from Cullinet's IDMS/R database management system. For example, when you issue material from inventory, the system automatically updates inventory balances, allocates the quantities to Shop Floor Control and converts the units to dollars for Cost Control. Additionally General Ledger Accounts are updated because the Cullinet Manufacturing System is completely integrated with Cullinet's Financial System.

Vertical integration means that the manufacturing system is designed and developed using IDMS/R and ADS/OnLine, Cullinet's fourth generation programming productivity tool. This unique architecture provides data processing with the means to tailor and modify the system. Since you don't want to change your business to match the features of a software package, Cullinet provides the tools to tailor the manufacturing system to meet your company's requirements.

The combination of horizontal and vertical integration means, for the first time, a manufacturing system is available that meets the requirements of both data processing and manufacturing management.

Attend a productive seminar explaining this integrated manufacturing system. To participate in one of the 700 Cullinet seminars scheduled internationally, send in the coupon or call 1-800-225-9930. In MA, 617-329-7700.

**Fred Buckley is Cullinet's Manager of Manufacturing Applications Software Development. His efforts have been crucial in achieving the integration that makes Cullinet's manufacturing system unique. Fred joined Cullinet in 1977. Fred holds a degree in Computer Science from Thames Valley State and is a member of the American Production and Inventory Control Society.*

A few lessons in salesmanship

Providing data security is a lot like staying in shape; everyone agrees it's a great idea, but most find it easier to talk about fitness than to run laps at the gym.

As indicated by a recent survey of the Data Processing Management Association, the vast majority of upper level managers concurs that corporate information assets should be protected [CW, Feb. 27]. But many firms surveyed in the DPMA poll allocate nothing for data protection, and most of those that do, actually provide very little in the way of funding.

It would be too easy and, perhaps, too simple to say that top management pays little more than lip service to what are, in fact, pressing data security needs that often go unmet. After all, if a stolen disk or tape shuts down the data processing department, top management will feel plenty of heat when the system failure bills are tallied.

Could it be, then, that DP and MIS professionals need a few lessons in salesmanship?

The DPMA members polled in the survey seemed to think so, given their recommendations for improving the funding of data security projects. But other, somewhat disturbing factors that have come to light recently indicate that top management may not be getting the security message all that clearly.

For example, Digital Equipment Corp. performed a comprehensive market survey prior to making a multimillion dollar commitment to establishing a nationwide records management network. DEC's survey indicated that most companies that tend to data security needs do so in-house, rather than using any of the growing number of off-site storage companies or disaster recovery services. The problem is with some of the security techniques being employed — such as that of a DP specialist in Boston who took sensitive tapes home each night and locked them in her closet.

In the more usual case, key disks and tapes are kept in storage cabinets, where they are easy marks for pilferers and saboteurs. According to the DPMA, the greatest threat to data security is misuse of data by in-house staffers, while other recent surveys and studies bear out the rising incidence of unprotected data being destroyed or altered. If management isn't acting forthwith to protect such vital corporate assets, perhaps the security sell job is falling short of illuminating the potential dangers of unguarded resources.

First, top management must realize that the expense of protecting corporate information assets is just another cost of doing business. This can only follow a detailed, unembellished and honest accounting of the DP shop's security needs — doomsayers need not apply for the sales job.

Also, bear in mind that top managers, like the end users the DP shop serves, are inherently solution-oriented. DPers, on the other hand, can be rather detail-oriented. There must be a meeting of the minds somewhere in the middle, with security concerns hanging in this balance.

Stamp of approval

LETTER

Challenging the view that superminis, CPUs in same performance class

Our management would like to challenge the contention in "IBM 4300 rivals reach 95 in number" [CW, Jan. 30] that superminicomputers and IBM mainframes are in the same performance class. We recently purchased a Prime Computer, Inc. information supermini together with fully integrated application software (Manfact II), developed by Compufact of Santa Ana, Calif. Under the leadership of our plant manager, we installed order processing, sales history, payroll, materials management, a full complement of financial applications and replaced an IBM 4331 in less than nine months while reducing the MIS budget by 50%.

Using a query/report writer, our users have direct access to the entire production data base. System availability for the 23-terminal network has been very high, with less than five hours downtime in 18 months.

An MIS manager concerned with cost-effectiveness and responsiveness of his department should consider the significant advantages superminis have over mid-range mainframes. These include ease of operation and installation and expansion without software conversion. Based on our experience, this kind of system could be installed for less than $250,000.

The chrysanthemum or the sword

LIGHT ON SCIENCE
Charles P. Lecht

I was having breakfast at the Hotel Okura in Tokyo when I read in the Feb. 17 issue of *Japan Times* about the breakthrough: Hitachi Ltd. scientists had produced a high-performance circuit switch of silicon emitter coupled logic (ECL) that won the world speed record in the continuing race to produce faster signal processing capabilities. Registering gate delays of an astonishingly low 84 picoseconds through the usage of sidewall base contact structured (Sicos) transistors, the Hitachi achievement cuts, by two-thirds, previous gate delay records for ECL circuits.

According to Dr. Minoru Nagata, leader of the development team, "The Sicos logic circuits may well clear the way for the development of a future generation of ultrafast computers." What he means, of course, is that the incorporation of such high-speed gates into circuits on very large-scale integration (VLSI) chips can produce super-duper computers that'll beat the pants off any mere supercomputer known to science today. No doubt American scientists are working on similar and not so similar technologies to match and improve upon Hitachi's gate performance, but, for the moment, the Japanese fulfill our American dream of being No. 1, and they should be proud of this accomplishment.

After the flogging Hitachi took in the American press in late 1982 and throughout 1983, this early 1984 news may come as a surprise to our computer establishment. Publicly accused of obtaining U.S. technology illicitly and disqualified after having been low bidder for installation of computer systems into the same U.S. bureau (the Federal Bureau of Investigation) that helped smoke out what it was apparently up to, Hitachi was then shamed into telling its prestigious Japanese clientele that it would have to start paying software royalties to an American competitor for what was thought to be Hitachi's software.

Americans might well expect to be forgiven if they overlooked the fact that Hitachi was engaged in legitimate research of its own. By the volume of reports of Hitachi's misdeeds, some Americans may have even concluded that Hitachi had converted all its research microscopes into spy telescopes and sent its scientists to America to seek our hot research results, possibly reading these from the desks of our inventors from trees outside their suburban office windows and posting these to Tokyo before they cooled. Now it turns out that at least some Hitachi researchers must have stayed home — however else could they have had the time to make their new "picoswitch?" They've got to be "clean" on this one, folks; you can't copy and be No. 1.

Which brings me to the point of this essay. Hitachi's success comes only a few days after Fujitsu Ltd. sent a 1984 valentine to the American supercomputer community in the form of an announcement of a computer system with the curious capacity to run programs written for IBM 370 lineage systems while doing the number crunching expected of the next generation of Cray Research, Inc.'s latest supercomputer and Nippon Electric Corp.'s (NEC) announcement of a 1.33-byte processor.

American/Japanese relations

These 1984 "openers" from Japan should provide the U.S. computer systems manufacturing and user community with reason to pause to think about American/Japanese science relationships and their future. They signify to me that the timing couldn't be better for American and Japanese scientists to seek increased cooperation in basic research.

The Japanese computer industry is still very small in comparison with our own, less than 10% in dollar volume of world sales, most of which occur in Japan. While short on income, it is long in brains — the stuff that counts in creating competitive products. VLSI improvements (like Hitachi's), new systems architectures (like Fujitsu's) and high-performance supercomputers (like NEC's) are essential to improve the price/performance potential of our products if we are to continue to maintain the world leadership in computer technology we currently hold.

Since at the present time the high-technology Japanese community is inclined toward American leadership and is itself a bastion of free enterprise that truly believes in our capitalist system of competition, we would minimally do well to nurture the status quo through friendship and mutual support of our common goals. These include world peace through world trade.

Of course we cannot easily forgive any company, Japanese or otherwise, that violates the just rights to ownership of the products of another company, be it American or otherwise. But forebearance and prudence must be exercised to overcome the inevitable disputes that have their origins in cultural differences and whose resolution defies logic. Hitachi's admission of its guilt and its settlement with the company whose rights it violated were exemplary in this sense. Nothing could be gained by our continued punitive interest in this affair, except, perhaps, a lessening of friendship with the Japanese computer industry, which is compelled to notice that very few Japanese computer systems products have ever made their way to American users, while ours still account for most of their installed base.

Japan's population is roughly half the size of ours. Together we account for less than 10% of the population of our global community, but roughly 80% of its computer systems business income.

Nothing new like Hitachi's breakthrough has emerged in years from our European colleagues, save perhaps those working in American companies abroad. The stagnated European computer systems industry cannot help but notice that the vital ingredient it lacks, namely, research for development of indigenous products, is available in Japan. Many American companies have noticed this and have benefited by innovation in Japanese research. Better cooperation with Japanese technology companies by American industry will ultimately stop the trend of Europeans to play one against the other in a competition that benefits neither.

Since we, at the moment, hold world leadership in almost every research, development and manufacturing category, the negative effects of an increase in cooperation, when compared with those accruing from an increase in competition, seem preferable to me.

Negotiation would help

Negotiation for better cooperation from a position of strength in international marketplaces would help us. That America's international marketplace strength is diminishing is evidenced by our diminishing world marketplace share. That this is occurring during a period of intensive home growth, and at a time when creating computer systems is possible by all developed countries, should provide some measure of comfort. But today's vitality of our computer industry and tomorrow's promise have not diminished one iota, by my reckoning, international marketplace

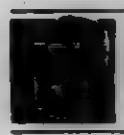
Bargain basement personal computer clones: a play



HUMAN CONNECTION
Jack Slone

I'm askance at how IBM Personal Computer "cloners" are claiming vast capabilities for their machines while cutting their prices to levels that seem to be only a hair's width away from manufacturing costs. It certainly does make the process of selecting a personal computer a confusing one, particularly for the millions of American fathers who are trying desperately to purchase an IBM-like machine for their prodigious programming/systems development offspring at prices that do not siphon off all the family wealth.

The time and place: Today, Big City, U.S.

The characters: Harold Rockman, well-to-do businessman. Jeremy Rockman, Harold Rockman's son.

The scene: Harold Rockman enters the living room, both arms loaded down with bundles of personal computer sales literature. He is wearing a wry smile, ready to enter what he believes to be the final and winning round of the year-long, computer-acquisition joust he's been having with his bright 11-year-old hacker/kid, Jeremy. The child comes skipping into the living room.

Harold: Jeremy, my beloved son, after long, agonizing hours of study and research, do I have the machine for you! Let me quote from the ad: "IBM Clone — The Sanyo 550 for Under $1,000!"

Jeremy: Papa, dear papa, I find myself totally unable to comprehend how a processing device with qualities allegedly comparable to those of an IBM Personal Computer can possibly be marketed for a grand.

Harold: Well, then, kiddo, let me enumerate the ways. I submit that the Sanyo is the machine for you to have and to hold from this day forward because you buy a load of features and functions for the buck. For instance, it positively glows with processing power, what with 128K bytes of random-access memory of the 16-bit variety oriented around Microsoft, Inc.'s MS-DOS, a vast improvement over the 8-bit, Digital Research, Inc. CP/M vintage machines.

Jeremy: You're turning my head.

Harold: Naturally, it has bundled software that meets your needs exactly. Like the word processing software Wordstar from Micropro International Corp.

Jeremy: Wordstar? That's so clumsy you need control keys just to control your control keys.

Harold: The Sanyo is a creature of modern times. It's loaded with program function keys.

Jeremy: How sweet it is! When do I hear the bad news?

Harold: To be sure, there are a few minor deficiencies, but I feel confident you can work around them.

Jeremy: Lay it on me.

Harold: Well, for one, it's slightly shy of a monitor. But don't worry about it. One of the fellows at the office told me we can pick up a used one from the classified ads. And then it's somewhat short of a second disk drive. But better one drive than a tape cassette recorder. Of course, we'll have to add a printer, but that's not too bad a problem. I saw a preowned daisywheel job advertised for under $300.

Jeremy: Is it the one that speeds along at all of 10 char./sec.?

Harold: Okay, okay. But it sure beats a pencil and paper. So my young friend, what do you say? Shall we make the big move?

Jeremy: Tell you what, pop. Why don't we just skip this generation and wait for AT&T to provide an IBM Personal Computer emulator on its soon-to-be announced Unix-driven 32-bit machine? ‡

Computers took the strain out of processing data.

Now Raytheon has taken the strain out of data processing.

Introducing the PTS-1000/4000 family of 3270-type information display systems. Designed to combine mainframe compatibility, operator comfort, and peace of mind for DP managers too.

How can we promise all that?

After more than a decade of experience in 3270 emulation, Raytheon designed the PTS-1000/4000 family to offer the utmost in flexibility, so you can mix and match any of our new controllers with any of our new display and printer terminals.

When it comes to operator comfort, no one offers interactive displays with more built-in ergonomic features than Raytheon. Features especially designed to ease the strain on one's neck and back, hand and wrist, and eyes.

The microprocessor-based PTS-1000/4000 family enables efficient distribution of your data processing workload with flexible configuration options and extensive self-diagnostic capabilities. Binary synchronous, systems network architecture (local and remote), and airline link control communication protocols are supported. Large and small control units, multiple screen sizes, and a wide variety of peripheral input/output devices and printers can be mixed and matched with varying star, multidropped cabling, or multiplexed configurations.

Special system features include productivity enhancements like local format storage, response time monitors, row/column indicators, and unprotected field indicators.

As for the DP manager's peace of mind, Raytheon offers flexible financing and leasing options, competitive pricing, over 2000 service people worldwide, and a commitment for today and tomorrow that can come only from the largest independent supplier of intelligent terminal processing equipment.

The PTS-1000/4000 information display systems from Raytheon Data Systems. We take the strain out of your data processing. For the sales office nearest you, check your telephone directory or call 1-800-343-6676.

Sharing perspectives on fifth generation

LETTER

The article "Fifth generation poses challenge" [CW, Jan. 16] will, I hope, stimulate needed thought and action. In order to meet that challenge, however, it is important that we share further perspectives. Japan's Fifth-Generation Computer Systems (FGCS) Project is a 10-year, government-industry collaboration that was initiated in October 1981. The project's philosophy includes concepts of commercial applications and world preeminence, but transcends that with visions of meeting projected needs of "the economy and society of the future," providing "new insights to and outlooks on the nature of intellect and knowledge," enhancing international understanding and cooperation and contributing to "more advanced, humane behavior" and, thereby, to a "more balanced society," the FGCS said.

In pursuing those goals, they seek far more than new architectures, packaging techniques, circuit substrates and further understanding of artificial intelligence concepts and their use in a computer system. Their concept of "data" is enlarged to "knowledge information." Whereas our AI seeks to work in conventional computers, they are reconceiving "computers" entirely.

They seek to develop not only new theories, but also "the framework of a new theoretical system . . . a new system of theories," the FGCS said. Comprehensive and component theoretical grounding pervades their project as a fundamental requirement.

The article's concerns about the Defense Advanced Research Projects Agency (Darpa) being the prime money pump for our fifth-generation work are understandable, but can be assuaged by other considerations. Darpa's involvement is due not to the likelihood of initial fifth-generation uses being military, but rather, to industry's default. However, Darpa's role does not preordain government control over the computer market.

Ironically, the U.S. fifth-generation computer industry may turn out to have been built on the foundations laid by U.S.- and Japanese government-sponsored research and development. For the Japanese project is a remarkable, open enterprise, involving extensive international cooperation and exchange programs.

The PC security problem

eliminated

JAPAN from page 40

diminution or not. It would follow that a revitalized cooperation between Japan and the U.S. could help bring to bear the best of both together to counter erosion in the foreign marketplaces of either.

And never has European dependence on U.S. technology in the key area of large systems development been stronger. With the opening of the new Chinese marketplace, only Japan has the capability to supply large systems technology, if it isn't acquired from us. Still trying to lessen imports of these systems from the U.S., Japan's export capability will be limited for some time to come. Would it not make sense to put Japanese/American computer systems affairs in the best of condition at this moment and, were it possible, to tighten business relationships to coordinate external sales efforts for mutual benefit? European countries create multinational joint venture companies to attack foreign marketplaces; aircraft produced by these companies fly all over America these days. Just think of the performance such a Japanese/American joint venture could expect in computer systems manufacture and sales.

Ruth Benedict's classic, *The Chrysanthemum and The Sword* (published by Meridian Books in 1946), provides Americans with a picture of the patterns of Japanese culture as perceived in America following the calamity of the early 1940s. Though the book is beautifully written, it still is hard for Americans reading it to understand the why's and wherefore's of Japanese thinking from its pages; for example, the story of the 47 Ronin. But one thing is clear throughout the text: The Japanese respect, even admire, American ingenuity and leadership. There have been startling changes since 1946 in Japan, but most have created a better alignment with our principles, be these in business or elsewhere. In view of what I perceive to be the case, Japan's computer industry may soon grow tired of offering chrysanthemums to potential American partners hoping for nothing more than fairness by anyone's standard. If this isn't in the offing, human mettle of the kind which swords are tempered may stiffen the resolve of a spurned Japanese industry to seek to redress their wounds elsewhere.

Lecht is chairman of Lecht Sciences, Inc., a New York-based think tank specializing in computer and communications technologies.

SOFTWARE & SERVICES

Using contractor offers advantages

Timely completion of urgent tasks

By Richard W. Schlosser
Special to CW‡

Careful use of systems programmer contractors and consultants can provide important benefits to your data processing organization, especially when good programming talent is hard to find.

The Data Service Bureau of the city of Los Angeles provides data processing services to over 50 departments within the city as well as to over 60 outside agencies. Our annual budget is $23 million, with a biweekly payroll of $350,000 for 340 employees. We support dozens of applications for a broad range of city services as well as an information center.

The technical support section of the Management Services Division provides systems programming support, network support and long-range systems planning.

In late 1981, with several major projects and migrations beginning to occur at the same time, the technical support section faced a critical shortage of qualified systems programmers.

Among the solutions we selectively employed were to conduct more aggressive recruiting through advertising and various job fairs. We also sought qualified personnel in other sections of the department or in other departments of the organization. In specialized cases, personal service contracts for ex-employees were used.

We also used systems programmer contractors and consultants. However, differences between contractors and consultants have to be considered before hiring.

Contract systems programmers are typically oriented toward software internals, have recent detailed technical expertise and may assume some of the responsibilities of a lead systems programmer. A consultant, on the other hand, is more oriented toward conceptual viewpoints and the concerns of management.

Contractors are usually best used in control software installations, migrations, modified control software coding or maintenance of existing software. Consultants commonly deliver studies, analyses, methodologies and recommendations. A contractor is normally employed longer in a single engagement, may have less experience and will likely be less expensive.

In the first quarter of 1982, a contractor was hired to aid in the management of a direct-access storage device. By the second

Priming users for package installation

By Sheila M. Olson
Special to CW‡

All too frequently, a software package that supplants the manual way a company does business meets with nothing but displeasure from those who are faced with using it. Certain guidelines that can help allay these complaints should be followed. Familiarizing the user with the capabilities of the software package, offering company-specific applications and making management's objectives for using the package clear to everyone will ensure a more successful implementation and help prevent "false starts."

The cry is often heard, "What's wrong with doing it the old way? No doubt, the "old way" worked and produced satisfactory results; however, someone high on the hierarchical ladder saw the limitations and took action.

Old ways tend to be department specific. For example, a group of managers devised a way to acquire project totals. Management gave little consideration to standardizing reporting procedures since it received the required information. Additionally, other departments had their needs met with their own reporting procedures. With everyone generating the same information, but in a different manner, reverting to a manual method of reporting across department lines became necessary — a wasteful and inefficient use of resource time. In our quest for greater productivity, standardizing the way we do business makes retrieval of information easier and less costly overall.

When management has decided to implement software to facilitate its goals, the package should provide the functionality provided by the old method. Since today's packages are sophisticated in their specialized area, the potential exists to take the application beyond the functionality of the "homegrown" system.

Instruction in the full functionality of a software package helps users to comprehend this grand view and apply it to their specific needs. While application may be limited and somewhat basic during the initial stages of implementation, a presentation of its total capabilities will offer an awareness and an appreciation of the total package. Some users will never venture beyond the basics of the total package. Oth-

Mantis release features enhancements

CINCINNATI — Expanded interactive and operational capabilities for prototyping, documentation and file access are featured in Release 3.7 of Cincom Systems, Inc.'s Mantis application development system.

Enhancements in the new release include automatic access to the Logical User View (LUV) component on Cincom's TIS relational data base management system (DBMS).

Enhancements to the interface to IBM's DL/1 file structure include the unqualified Call Profile design facility, which provides a menu of options for handling DL/1 calls; Path Calls, which allows the user to use command codes to manipulate multiple segments within a call; optional semi-reserved words in the interface area definition; data base access via logical or secondary indexes; prefixing; dynamic override of the program specification block name and program communication block number in a Call Profile; and use of Boolean commands to connect a segment search argument with the next argument list in the Call Profile search field list, according to a spokesman for the vendor.

A batch print facility allows for printing of all Mantis entities including screens, files and programs, the spokesman said. An enhanced create/update screen facility lets users add or delete a line while updating a screen design without reentering data. It also provides for use of confirmation messages for library functions and includes an increase in interface parameters, an enhanced directory facility and the ability to run a program by name retry.

Mantis runs in Cincom's TIS-DC and IBM CICS environments and ranges in price from $21,000 to $59,000.

Mantis DBMS support and external LUV support each cost $5,000. DL/1 support costs $9,950, the vendor said.

Cincom is located at 2300 Montana Ave., Cincinnati, Ohio 45211.

Netron's CAP modified to run on IBM CPUs

NEW ORLEANS — Netron, Inc. announced at the Softcon International Conference and Trade Fair for the Software Industry that its Computer-Aided Programming (CAP) software development system currently offered on Wang Laboratories, Inc. VS computers has been modified for use as a development tool for IBM mainframes.

CAP employs reusable code, a high-level language and a "frame" concept that is said to eliminate most hand coding of standard applications. Users develop programs by filling in menu screens, and CAP generates most of the Cobol code. In addition, programs can be modified and customized using the high-level language.

Netron President Alex Risin said the new capability allows CAP to be used as a dedicated program creation tool in large IBM shops. The Wang VS can typically compile a 5,000-line Cobol program in under three minutes; code that is generated under CAP on the Wang VS can run immediately under IBM CICS, but cannot run on the Wang, he said. CAP supports fully interactive IBM 3270 terminal emulation.

Wang will not market CAP, but will publicize it to users through its technical symposia. With the IBM emulation capability, CAP requires IBM's MVS, CICS and Vsam files. It will be available in the fourth quarter of this year at a price of $16,000 for the first terminal and $8,000 for each additional terminal, according to the vendor.

Netron is located at 90 St. Regis Crescent N., Downsview, Toronto, Canada M3J1Y9.

V-Link joins VAX-11, Cray-1

KANSAS CITY, Mo. — United Information Services (UIS), a division of Control Data Corp., has announced a distributed data processing system said to connect Digital Equipment Corp.'s VAX-11 series superminis to UIS's Cray Research, Inc. Cray-1 supercomputer.

V-Link reportedly allows users to submit jobs to the Cray-1 from their VAX-11 environment. The system includes UIS's interface software; a communications processor; modems; and a dedicated, conditioned telephone line.

The system supports high-speed, high-volume throughput using 16K bit/sec lines. Also, V-Link commands conform to the DEC VMS standard, a spokesman said. Through V-Link, users can also use the UIS library of engineering programs, according to the vendor.

V-Link pricing includes a $5,000 one-time installation fee and a $5,000 monthly fee, which includes $2,000 worth of Cray processing, the vendor said.

UIS can be reached through P.O. Box 8551, Kansas City, Mo. 64114.

Omnibase on data base machine

GOLETA, Calif. — Signal Technology, Inc. has announced that its Omnibase data base management software is now being sold with the Britton-Lee, Inc. Intelligent Database Machine as a relational data base management system.

The package is designed to operate with multiple Digital Equipment Corp. VAX-11 superminicomputers, freeing the VAX-11s for uses other than data base management.

Omnibase is said to include Signal Technology's Opal programmers' applications library for accessing the Intelligent Database Machine through any VAX-11 host language, and Signal Technology's Smartstar, a family of programs for applications generation.

The Intelligent Database Machine reportedly supports a data base of more than 16G bytes and can be connected to several VAX-11s with IEEE-488 parallel interfaces.

Prices for Omnibase range from $17,000 to $40,000, and prices for the Intelligent Database Machine range from $45,000 to $99,800, according to the vendor.

Additional information can be obtained from Signal Technology is located at 5951 Encina Road, Goleta, Calif. 93117.

Easytrieve Plus gets update

OAK BROOK, Ill. — Panaophic Systems, Inc. has announced a new version of its Easytrieve Plus information retrieval and data management system. The system was formerly called PRO/grammar.

Enhancements to Version 4.0 include expanded reporting flexibility through the use of special logic procedures along with other options for the dictation of special formatting requirements. Improved file processing facilities now include a synchronized multifile input facility for an unlimited number of files.

An extended debugging and compile option capability has been added along with increased logic facilities, including logic statements and the ability to use up to 18 digits automatically. The new release also incorporates object code creation capabilities and does not restrict the size of program and storage areas.

The new release will be offered to current Easytrieve and PRO/grammar users on maintenance at no charge. Easytrieve customers who purchased PRO/grammar prior to this announcement will be compensated based on their purchase price of the product and their length of use. Easytrieve Plus costs $25,000 for IBM DOS users and $35,000 for IBM OS users.

More information is available from Panaophic, located at 709 Enterprise Drive, Oak Brook, Ill. 60521.

Facility out for Scanmaster

RYE BROOK, N.Y. — Claiming to have developed a new way for users of its 3270-type terminals to route and retrieve mail and documents, IBM has announced an Image View Facility for its Scanmaster I document transceiver. The facility is said to allow users of IBM's 3270-Personal Computer, 3278 CRT terminals, 3279 color CRT terminals, 6775 CRT terminals and the 3290 Information Panel to view images of documents such as signed letters, insurance application forms or line drawings.

IBM said the image viewing facility offers an alternative to manual filing, microfiche and optical disk systems.

Requirements for the Image View Facility are a processor employing 370 architecture (such as IBM 4300 series or 30 series processors) and a Scanmaster I. The facility operates as a CICS program in a Discos/MVS Version 3 operating system environment with Discos/PS Release 1.1.

Also required is IBM's Graphical Data Display Manager Release 3 program product and IBM's PL/I transient library.

The facility works on any IBM 3270-type display equipped with at least six programmed symbols.

There is a one-time license fee of $5,400 for the Image View Facility. The Scanmaster I, which was announced in 1983, is a Systems Network Architecture/Synchronous Data Link Control device which operates over switched or nonswitched communications facilities at speeds up to 9,600 bit/sec. The unit consists of a controller, scanner and printer and costs $11,800, IBM said.

More information can be obtained from IBM Information Systems Group, 600 King St., Rye Brook, N.Y. 10573.

Smartstar targets VAX/VMS

GOLETA, Calif. — Signal Technology, Inc. has introduced Smartstar, an applications generator for Digital Equipment Corp.'s VAX/VMS users.

The product offers Smartdesign, a user tool for specification of data records, field attributes and forms layout; Smartquery, a fourth-generation program for query, entry, editing and deletion of data records viewed through a multiple window or scrolled forms; Smartcall, a programmer's interface to Smartstar through a runtime library; and Request, an integrated report and query system.

Smartstar ranges in price from $4,080 to $13,600.

Signal Technology is located at 5951 Encina Road, Goleta, Calif. 93117.

DOS/VSE and CICS/VS Frustration?

BIM gets it out of your system.

BIM presents a line of proven programs that maximize your system's capabilities, saving you time, labor and expense. These program products help get the most out of your system and people.

BIM-EDIT — the editor with more than 25 significant features that ICCF can't match.
BIMSPOOL — Prints output in POWER/VSE spooling queue on local or remote 3270 terminal printers. (Received ICP Million Dollar Award 1982).
BIMSPOOM — On-Line to Batch Print Spooling. Prints data passed from CICS application programs into the POWER spooling queue.
BIM-PDQ — POWER Dynamic Queuing performance enhancement. Eliminates 85% of the I/O to heavily used POWER queue.
BIM-ODIS — Comprehensive problem analysis and display of operational CICS system.
BIMTEXT — Word processing, document composition system. Create formatted documents from free-form input.
BIMSWAP — Switch local 3270 BTAM terminals between multiple CICS partitions without special hardware or additional ports.
BIMCMPRS — CICS 3270 data compression system. Reduces response time for remote terminals significantly. Available for OS/VS1 and MVS also.
BIMP3270 — Comprehensive CRT screen image print facility. Copy to terminal printers or spool queue for system printer.
BIMSERV — On-line display of library directories and entries, VSAM Catalog entries, disk VTOC's, etc.
BIMDSLOG — Console Message File display. Used by computer operations and programmers.
BIMMONTR — DOS/VSE System Status, Performance Measurement, and POWER Queue display.
BIMDEVC — Displays Logical Unit assignments for physical devices, to resolve operational problems.
BIMSUBMT — On-line Job Edit and Submission facility.

BIM programs are cost-efficient, many less than $600, highest $4000. You can save even more with our group package offerings. Products are available on permanent, annual, or monthly leases, and shipped on a 30-day free trial basis. Product documentation is available on request.

BIM also performs systems programming consulting, with consultants based in Minneapolis and Washington, D.C. Computer time services are also available on our 4331-2 system, on-site or remote.

VMBACKUP

"When VMBACKUP creates a backup tape of our DASD, we know that the minidisks and files can be restored."

VMBACKUP—The fastest incremental backup system available for the VM environment.

- Verifies quality of tapes and DASD files to ensure restorability
- Reduces backup time by up to 90%
- Cuts backup tape usage by as much as 80% with incremental dumps and packing
- Provides full screen restore for end users
- Includes standalone restore facility
- Offers optional encryption
- Provides complete catalog of backups
- Uses full standard labels to protect backup tapes
- Requires no mods to CP or CMS

SOFTWARE & SERVICES

SYSTEMS SOFTWARE

DYNAMIC MICROPROCESSOR ASSOCIATES, INC.
Termcom

Dynamic Microprocessor Associates, Inc. has introduced a terminal emulator that reportedly enables any microcomputer to replace dedicated terminals in communication with minicomputer and mainframe computers.

Termcom software permits local or remote communication between micros and mini or mainframe applications that were designed for specific terminals, a vendor spokesman said.

Termcom is available at two levels. Level 1 is said to emulate conversational terminals, but it requires that features to be emulated are supported on the microcomputer. Level 2 does not require identical features; the buffered terminal emulator supports features found in block-oriented terminals, the spokesman said.

Termcom requires an asynchronous serial port. The product will work with the Zilog, Inc. Z80 microprocessor and the Intel Corp. 8086 and 8088 microprocessors. It is compatible with Digital Research, Inc.'s CP/M 80 and CP/M 86, Microsoft, Inc.'s MS-DOS, IBM's PC-DOS and Muse Corp.'s Turbodos operating systems.

The Level 1 costs $145 and Level 2 costs $180. Both are available now in minimum quantities of 50.

Dynamic Microprocessor Associates, 545 Fifth Ave., New York, N.Y. 10017.

MIRODA SOFTWARE ENGINEERING
Genprep-1 price cut

Miroda Software Engineering has announced a price reduction for its Genprep-1 program product for IBM mainframes.

The price for a permanent license has been reduced, effective immediately, from $3,000 to $2,000.

Genprep-1, available for IBM OS, DOS and MVS operating systems, is a general-purpose language preprocessor. It reportedly provides character string and numeric variables, execution control statements, recursive macros and the ability to invoke user-written subroutines, according to the vendor.

Miroda Software Engineering, P.O. Box 10089, Chicago, Ill. 60610.

NICOLET ZETA CORP.
ZDDM

Nicolet Zeta Corp. has announced a graphics capability package said to provide IBM mainframe users with the ability to create high-resolution pen plotter output.

The ZDDM software package functions as a postprocessor and reportedly converts IBM Graphic Data Display Manager (GDDM) code directly into the compact language used to drive all Nicolet Zeta Intelligent Pen Plotters. ZDDM is capable of reading all levels of GDDM, including Graphic Data Files.

The software costs $1,795 and requires one of the Zeta plotters, which start at $6,000, a spokesman said.

Nicolet Zeta, P.O. Box 4002, 2300 Stanwell Drive, Concord, Calif. 94524.

CHARLES RIVER DATA SYSTEMS, INC.
UN/System V; Unos Rev. 4

Charles River Data Systems, Inc. has announced two additions to its software products, including an implementation of the Unix System V operating system that is compatible with its proprietary Unos operating system.

The UN/System V operating system features record and file locking, interprocess synchronization, shared data facilities, priority scheduling and real-time-oriented device driver interfaces.

The vendor also announced Rev. 4 of Unos, which adds terminal-handling features, expanded process/memory device control facilities and automatic bootstrapping to the proprietary operating system.

The two operating systems run on the vendor's Universe 68 family of computers.

The UN/System V operating system is priced at $4,000; the Unos Rev. 4 costs $3,000.

Charles River Data Systems, 983 Concord St., Framingham, Mass. 01701.

JOHNSON SYSTEMS, INC.
Umax Version 3.1

Johnson Systems, Inc. has announced Version 3.1 of its IBM CICS Utilization Monitor and Chargeback System (Umax).

Version 3.1 includes full support for IBM's OS CICS/VS Release 1.6.1 and operating system release-independent real CPU time and paging statistics data collection. In addition, security enhancements permit screening of Umax transactions and prevention of unauthorized execution, the company said.

This release of Umax includes virtual storage constraint relief through individual file and program-level collection techniques as well as the addition of a file nesting-level indicator.

Release 3.1 of Umax supports OS CICS/VS 1.5, 1.6 and 1.6.1 and is priced at $6,000.

Johnson Systems, 8300 Greensboro Drive, McLean, Va., 22102.

ELECTRON INFORMATION SYSTEMS
Micro asynchronous communications package

Electron Information Systems has introduced a new version of its micro

Introducing MARK V™ for CICS users: a *unique*, 4th generation non-procedural application development system that saves you time and money at every stage of your application life cycle—and makes it all easy.

For two years, MARK V has been saving millions of dollars in application development for IMS users worldwide. Now Informatics has expanded MARK V to the CICS environment, too. Even so, MARK V is not for everyone. *But it may be for you if:*

- ☑ You need to reduce your backlog of medium to complex CICS or IMS applications.
- ☑ You use CICS or IMS with IBM-supported data access such as VSAM or DL/I.
- ☑ Your CICS or IMS system demands highly efficient application execution.

Then, MARK V can help you produce efficient compiled applications that rival the execution of well-written COBOL—in less than half the development time!

Easy application development and maintenance is just the beginning!

MARK V improves productivity throughout the application development and maintenance cycle—not just in the coding—by providing:

- Interactive application design and simulation
- Easy to use, menu-driven specification language for development and maintenance
- Transparent and complete data access/communications control
- Automatically produced application documentation

That means with MARK V your programmer need only specify the solution. MARK V generates the complete application. This methodology allows you to solve more complex problems more efficiently using less highly trained personnel—and that saves you money!

Reserve your free demonstration of MARK V—the simple way to develop and maintain your medium to complex CICS or IMS applications.

As a data processing professional, you're also a professional skeptic. But the simplicity, versatility and timesaving capabilities of MARK V are easy to see—and prove. To do so, simply mail the coupon below or call toll free. We'll schedule your *free demonstration* as quickly as we can. Remember, however, that interest in MARK V is unusually high. Scheduling is on a "first come" basis. So mail the coupon or call *today*.

To see MARK V CICS/IMS for yourself, mail the coupon or call toll free

SOFTWARE & SERVICES

Continued from page 66

asynchronous communications package to interface the IBM Personal Computer and compatible equipment to Sperry 1100 mainframes, a vendor spokesman said.

According to the vendor, the software is an extended version of Digital Research, Inc.'s CP/M operating system with identical features, including 300 or 1,200 bit/sec asynchronous communications, Basic and assembler languages on the micro, Cobol and assembler on the Sperry 1100, menu-driven, with error correction and retransmit during file transfer.

System requirements include 128K bytes of random-access memory and one disk drive, according to the vendor spokesman.

The package is available for $795, the spokesman said.

Electron Information Systems, 5554 S. Prince St., Littleton, Colo. 80120.

FOUR-PHASE SYSTEMS, INC.
ATS/IV

Four-Phase Systems, Inc. has announced an asynchronous terminal simulator software program that reportedly enables users of its Series 4000 and 5000 computer systems to access remote computing and information services such as the Dow Jones News/Retrieval Service and Reader's Digest Co.'s The Source.

The ATS/IV, an addition to the vendor's Multifunction Executive (MFE) product line, is said to allow access to time-sharing networks, other host application programs, additional devices with an asynchronous Ascii interface and other vendor's systems, a Four-Phase Systems spokesman said.

The ATS/IV program reportedly accommodates 32 concurrent communication lines and up to 32 MFE users, according to the vendor spokesman.

The ATS/IV program is priced at $1,500 per copy with quantity discounts available.

Four-Phase Systems, 10500 N. DeAnza Blvd., Cupertino, Calif. 95014.

EMPACT SOFTWARE
Stop-X37

Empact Software has introduced the Stop-X37, a program designed to stop B37, D37 and E37 abends in an IBM MVS environment.

Stop-X37 intercepts the job at the time of the abend, finds available disk space, allocates the space to the job and continues the job, the vendor said.

The user has control of which jobs are recovered and what recovery actions are taken. An audit trail is provided that documents each recovery, according to the spokesman.

A permanent license for Stop-X37 ranges from $5,000 to $10,000.

Empact Software, Post Office/Drawer 1297, Atlanta Office, Stone Mountain, Ga. 30086.

AMALGAMATED SOFTWARE OF NORTH AMERICA, INC.
Manifold

Amalgamated Software of North America, Inc. has introduced Manifold, a multiple index support for the IBM System/34. Manifold is for use with the vendor's Accler8 system.

According to the vendor, Manifold enables any field (less than 30 bytes) to be used as an index to a data file. The programmer can decide whether to add an index entry to each index when an addition is made.

Manifold will be available the second quarter of this year. The price is $1,200 for Accler8 users or can be rent-

MICRODATA INTRODUCES THE RELATIONAL OFFICE.

IT'S WHERE YOU'VE ALWAYS WANTED TO WORK.

"You left your computer in the kitchen and took the microwave to work by mistake!"

SOFTWARE & SERVICES

ed for $60 per month, according to the vendor.

Amalgamated Software of North America, P.O. Box 1058, Malibu, Calif. 90265.

SST COMPUTER SERVICES
Movjob

SST Computer Services has introduced a software program that reportedly enables IBM System/38 computers to move jobs from an inactive queue to an active job queue.

Called Movjob, the program permits users to move the job to another job queue without affecting the other jobs in the queue, according to a spokesman for the vendor.

The program is currently available and is priced at $50 per CPU, the vendor said.

SST Computer Services, 1112 St. Agnes Ave., Columbus, Ohio 43204.

MACKINNEY SYSTEMS, INC.
JCLXREF; CICS/CEMT; Power Commander/CICS; Power Commander-Batch

MacKinney Systems, Inc. has announced four software products for programmers using IBM's DOS/VSE operating system.

JCL Cross-Reference (JCLXREF) reportedly reads JCL and produces cross-reference lists showing every JCL member that uses each file, program or procedure, device, form and library. More than 30 optional reports can be generated in a single run, a spokesman said.

CICS/CEMT is said to allow CEMT commands to be issued from a batch job stream to open or close CICS files and disable transactions.

Power Commander/CICS is an interface between CICS and IBM's Power utility that reportedly enables users to enter Power commands using a menu screen. Security logic can be added to limit certain terminals to certain commands or jobs, the spokesman said.

Power Commander-Batch is said to allow Power commands to be issued from a batch job stream.

When a job is completed, the spokesman said, the user can automatically release other jobs to run in other partitions.

The programs are available for purchase now for $495. A one-year lease is available for $195, the vendor said.

MacKinney Systems, Rt. 2, Box 270-A, Fair Grove, Mo. 65648.

PRODUCTIVITY AIDS

HELP/36 SYSTEMS
Codebank

Help/36 Systems has introduced Codebank, a source code library system and self-customized program generator for the IBM System/36.

According to the vendor, Codebank lets users enter source code interactively by filling in blanks and allows them to enter, retrieve and change modules easily.

Codebank comes with more than 100 modules and seven program frames. Users do not need to wait until they enter their own source code to generate programs, the vendor said.

Codebank is priced at $950 per CPU, according to the vendor.

Help/36 Systems, 15102 Minnetonka Industrial Road, Minnetonka, Minn. 55345.

INFORMATION BUILDERS, INC.
Focus training courses

Information Builders, Inc. has announced a series of training programs for Focus, its fourth-generation programming language.

"Focus Basic Report Preparation," which runs on the IBM Personal Computer, consists of 16 modules that explain query and reporting facilities, creation of master file descriptions, relational file operations and commands, the vendor said. The course costs $5,000 for a site license which includes 10 copies of the course.

Also available is a self-study course booklet, "One Hour Focus Reporting Lesson," which costs $3.50.

"Video-Based Basic Report Preparation" consists of five half-hour video tapes covering Focus concepts and report writing. The course sells for $5,000.

Information Builders, 1250 Broadway, New York, N.Y. 10001.

BGS SYSTEMS FOR DP MANAGEMENT

JOBS from page 59

quarter, a critical need in the CICS area became apparent. Since the contractor was both experienced and interested in CICS internals, he was transferred into the CICS group. He has since become a permanent employee and one of our most knowledgeable CICS experts.

Other successful hires in the second quarter included a contractor to work on network performance and consultants to assist in establishing a formal ongoing capacity planning program. They have had a very positive effect on the staff.

One of the primary benefits of using contractors or consultants is the timely completion of critically urgent tasks. At the Data Service Bureau, several new functions of CICS required for an extensive law-enforcement system were installed, tested and implemented by a contractor.

Another advantage is that deliverables can have long-term benefits. Studies, analyses, recommendations, procedures, training guides and other forms of documentation can be referenced usefully even years beyond their origin.

A contractor can also offer candid observations on the operations of a shop. This is particularly true when the individuals involved come with a large variety of experiences in shops similar to your own.

Also, the requirement to define clearly the work environment to an outside party can encourage a supervisor to improve the documentation and organization of assignments and responsibilities.

My foremost recommendation is that you have a clear understanding of your requirements, including deliverables and time frames. This enables a better evaluation of alternatives and a more straightforward choice.

Once the decision to hire a contractor or a consultant has been made, steps should be taken to minimize any negative impact on staff. Selecting personnel who are both qualified and personable cannot be overemphasized. Consider global markets. Telephone interviews may be effectively conducted in these instances, particularly when prearranged outlines are used among several interviewers.

A panel of at least two individuals should meet to interview the prospective candidates. This not only ensures a more thorough review of a candidate's qualifications, but may encourage greater staff cooperation by involving more of them in the decision-making process. A candidate's personality should be factored into the evaluation to minimize negative impact on the staff.

Hidden costs such as travel expenses, per diems and administrative expenses should be clarified during evaluation. Other items to clarify involve guarantees about the quality and policies concerning which individuals will participate and replacement criteria.

A final recommendation when working with consultants is to express to them your nontechnical and management concerns.

Schlesser is technical support manager in the city of Los Angeles' Data Service Bureau.

RISKS from page 59

minimize this risk.

The inflexibility of contractual terms may prove to be a disadvantage if unforeseen circumstances shift the emphasis or direction of the work. In our case, the loss of an individual changed our priorities from direct-access storage device to CICS. Fortunately, flexible contract terms permitted us to respond with a contractor already on board.

A common risk among consultants is being less than candid with a client. To ensure future business or to please an acquaintance, a consultant may report only what a client wants to hear.

A final risk is the possibility of lowering morale among employees. We took several steps to avoid this. The first was to present fully to the staff the extent and impact of the vacancies. The second was to demonstrate what other alternatives were available and why they were inadequate. The third was to describe the various benefits that short-term technically qualified personnel could provide them.

USERS from page 59

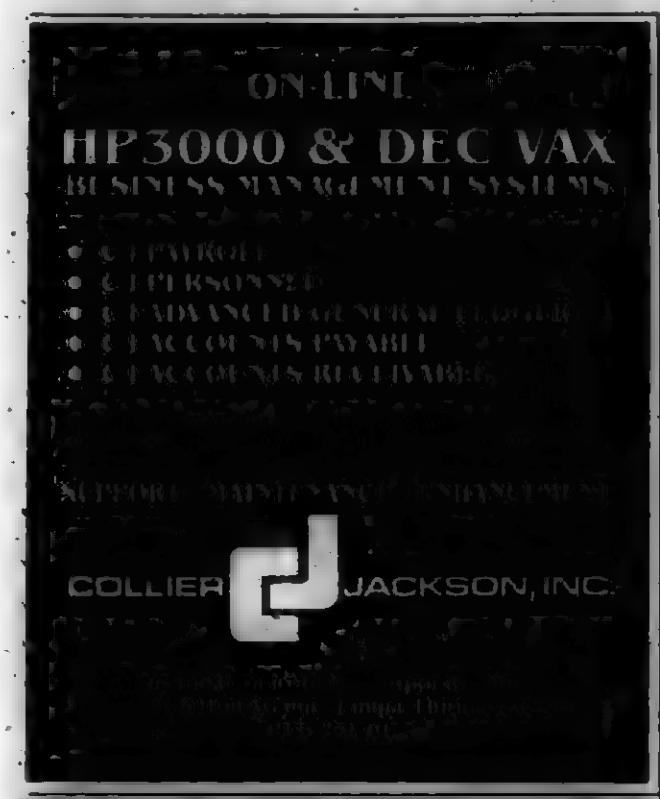
ers will draw on its capabilities and acquire some expertise in its application.

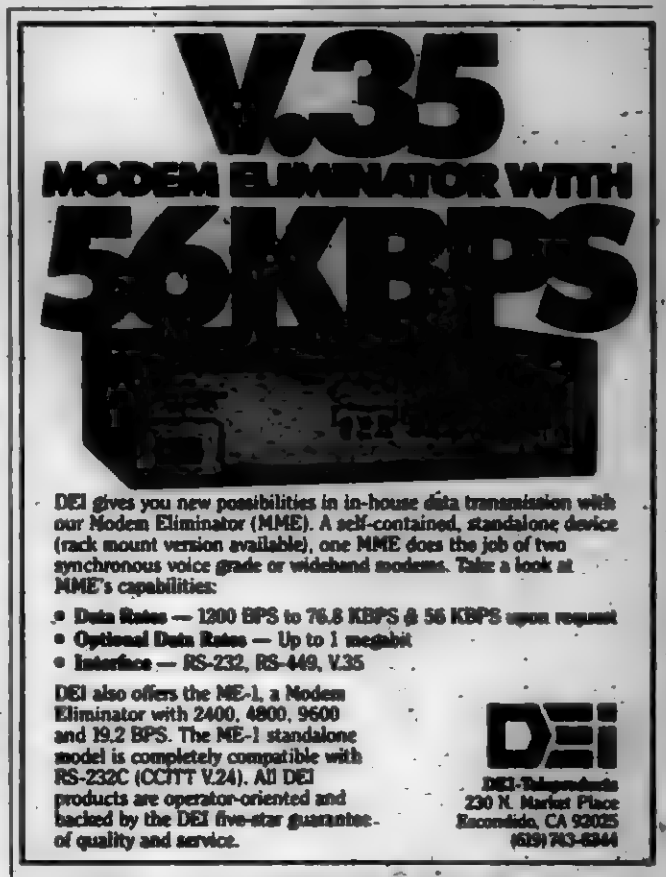
Training in company-specific applications must supplement overall system instruction. This areas can provide the opportunity for presenting company standards, policies and procedures in light of the package's total capabilities.

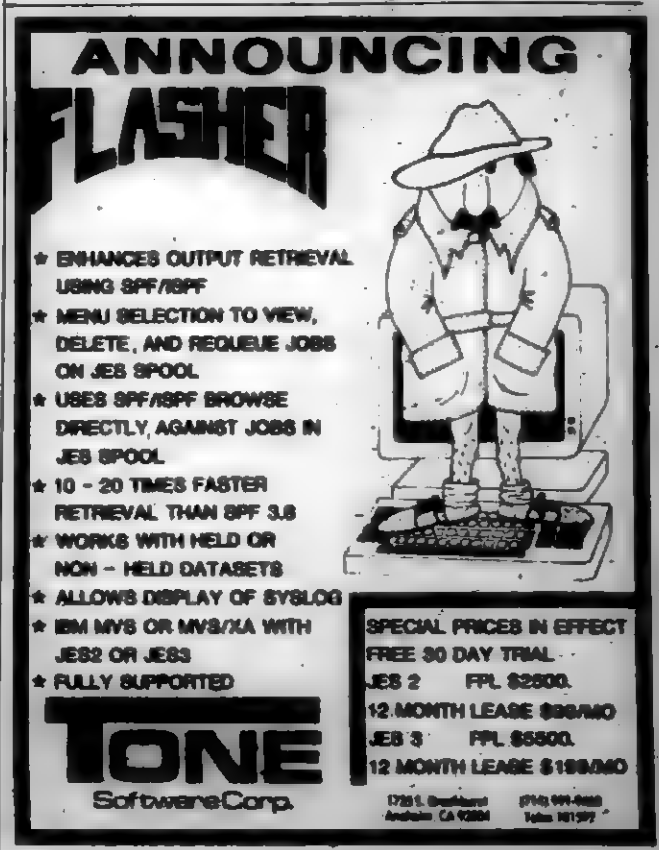
Most importantly, management establishes the objectives for implementing the package and makes these objectives known to everyone who will be using the software system.

Finally, adequate training in the capabilities of a software package must work in conjunction with managerial direction and support.

Olsen is project control coordinator at Wang Laboratories, Inc. in Chelmsford, Mass.







SOFTWARE & SERVICES

APPLICATION PACKAGES

MINI COMPUTER BUSINESS APPLICATIONS Full MRP

Mini Computer Business Applications (MCBA) has announced its new Full Material Requirements Planning (MRP) package written in Dibol.

According to the vendor, the new release closes the loop on the 17-package modular integrated MCBA Manufacturing System. It is available for Digital Equipment Corp. PDP-11 minicomputers under DEC's RSTS/E operating system.

The full MRP enables the user to create a master schedule and determine the quantities of raw materials, components and subassemblies required to support the schedule. It generates a material plan by utilizing data from departments within the organization.

A source code license is available for $4,000.

MCBA, 3441 Honolulu Ave., Montrose, Calif. 91020.

HEWLETT-PACKARD CO. 'Steps to Effective Business Graphics'

Hewlett-Packard Co. has published "Steps to Effective Business Graphics," a 54-page book that explains how to prepare business graphics.

Seven steps guide the reader to design of business graphics. The book explains how to choose a chart, use design principles, write messages clearly and work with color, the vendor said. Subjects discussed include preparing proportional graphics, special effects for overheads and 35mm slide techniques.

The book costs $12, according to the vendor.

Hewlett-Packard, 1820 Embarcadero Road, Palo Alto, Calif. 94303.

ALGOR INTERACTIVE SYSTEMS, INC. Supersap

Algor Interactive Systems, Inc. has announced a package designed to help engineers and designers conduct finite element stress and heat transfer analysis in construction and manufacturing.

Supersap, developed for use on Prime Computer, Inc. 50 Series superminicomputers, reportedly includes preprocessing, modeling, linear elastic analysis and postprocessing.

Options include interactive graphics, nonlinear analysis and Algor's Superdraw, an interactive design and drafting system, according to the vendor.

Supersap is priced at $5,000.

Algor Interactive Systems, Suite L3, Essex House, Essex Square, Pittsburgh, Pa. 15206.

PROFESSIONALS UNLIMITED Software directories

Professionals Unlimited has introduced software directories for IBM System/34 and System/38 users.

The 1984 directories are sent on diskettes that can be viewed on-line or printed. According to the vendor, they are updated daily.

The directories are available directly from the vendor, priced at $29.95 for the System/34 and $49 for the System/38.

Professionals Unlimited, 3951 Lantern Drive, Silver Spring, Md. 20902.

ABACUS DATA SYSTEMS, INC. Entag-M

Abacus Data Systems, Inc. has announced Entag-M, described as an inventory count system for use with Arthur Anderson and Co.'s Macpac inventory system on Hewlett-Packard Co.'s HP 3000 processors.

According to a spokesman, Entag-M is built on Abacus' basic physical inventory system known as Entag. Entag-M can be installed without changes to a user's Macpac programs or data base, and an initiator program will extract data from Macpac to support the system.

The system will print inventory tags for each part, showing the part description and unit of measure.

Written in Cobol II, Entag-M is priced at $2,400, according to the vendor.

Abacus Data Systems, 5000 W. Bloomingdale, Chicago, Ill. 60639.

N. DEAN MEYER AND ASSOCIATES, INC. 'Get OA Moving'

N. Dean Meyer and Associates, Inc. has announced a training and consulting service designed to develop and implement office automation.

"Get OA Moving" is said to include a series of executive briefings, management awareness programs and pilot projects.

The service is priced at $12,000.

N. Dean Meyer and Associates, 233 Mountain Road, Ridgefield, Conn. 06877.

KEY SOFTWARE, INC. Keysoft Order Management System

Key Software, Inc. has announced an order management system for distribution and manufacturing companies utilizing the IBM System/34 and System/36 small business computers.

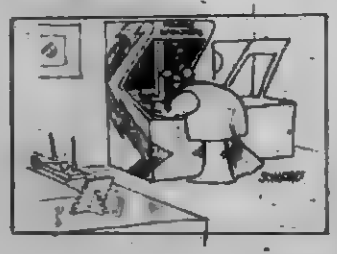
The Keysoft Order Management System features order entry with flexible item pricing, automatic inventory allocation, real-time physical inventory update and on-line data entry to variable line screens, a spokesman said.

It also offers accounts receivable with cash applications and credit management, past payment performance histories and comprehensive financial reports.

Additional features include invoicing/billing with an automatic back-order system, inventory control with on-line planning and forecasting and sales analysis with multiple comparisons, the vendor said.

A one-time license fee of $15,000 includes installation, training, documentation and code.

Key Software, 20212 Redwood Road, Castro Valley, Calif. 94546.



點心

"Wait a minute. Are you trying to tell me those terrific little Chinese dumplings improve programmer productivity?"

An understable confusion. "Dim Sum" does mean "terrific little Chinese dumplings."

But dmSum™ means "direct IMS update manager," a system development tool that lets IMS/VS and CICS/VS programmers examine, modify, and create DL/I test data from an online terminal. No waiting for batch turnaround, no job queue delay, and no complicated control statements to write. Just bring up the dmSum screen and key in the *same* DL/I parameters you'd code in an application program, including up to 6 SSAs. dmSum displays the contents of data base segments and paths in character and hex format; to update them you just overkey what's displayed and REPLace. Or ISRT new segments. Or DLET. You can browse through a data base, selectively updating and deleting, even if the segments lack unique keys. And you can use PF Keys to scroll through very large segments or paths, or to get HELP.

To find out more or arrange for a 90-day free trial, write to Peacetable Systems at 3250 Wilshire Boulevard, Suite 900, Los Angeles, California 90010 — or call us at (213) 225-4003.

Solution

INTEGRATED FINANCIAL MANAGEMENT SOFTWARE

BOSS INTEGRATES KEY FINANCIAL FUNCTIONS

MAPS is a new generation of software merging decision support tools and financial accounting applications into a powerful, flexible financial management capability. And all Ross products are fully on-line, interactive and bring you multi-user access.

MAPS/MODEL—Powerful financial modeling

MAPS/GRAPH—Quality business graphics

MAPS/DB—Flexible database management

MAPS/Pro—Micro modeling and graphics

MAPS/GL—Comprehensive general ledger

MAPS/AP—Full featured accounts payable

OUR SERVICE AND SUPPORT MAKE THE DIFFERENCE

We bring a commitment to our customers and products that reflects our 12 years of consulting experience. Our staff of experienced professionals can work closely with you to install our products, and to provide the ongoing training and support that make them true financial solutions.

Dynamic mainframe looking for suitable personal mate.

If you speak or want to learn IFPS®, we could make beautiful decisions together. P.S. Let's meet at the Information Center.

In the past, the hardest thing about financial planning was planning how to do it. That was until Execucom introduced IFPS. IFPS makes problem solving and decision making a lot easier. The tangle of technical details is avoided. And managers are able to master it in a very short time.

Now, financial planners have an opportunity to extend the power of IFPS Decision Support Software to their personal computers, an incredible advantage over any other Decision Support System available.

See Your Mainframe And Personal Computer Work Together At The Information Center.

When IFPS/Personal™ is linked to your mainframe through the Corporate Information Center, the reach of financial planning software is extended throughout your entire organization. You can easily and quickly transfer models and data between your mainframe and desktop computers and solve these models on *either* end.

You can share and consolidate individual models, reports and data files. You can create them all on your Personal Computer and process them on your mainframe. And IFPS is compatible with the leading general ledger, database and statistics software packages used by corporations.

Do All Your Planning And Modeling In English.

Thanks to the non-procedural language used in both IFPS and IFPS/Personal, you do not have to be a computer expert to build sophisticated models. Or to understand those that other people construct.

Receive The Most Comprehensive Computer Software Training And Service Program Available.

Not only a fact, but a promise. We have developed a support program that offers mainframe-level support on IFPS/Personal. It includes expert technical support for installation, superb documentation, comprehensive training programs, HotLine support, specialized consulting, periodic product enhancements and user associations. We believe that state-of-the-art technology deserves state-of-the-art service.

If the personals ad above looks like it may have been written by your lonely mainframe, call or write Execucom immediately and we'll tell you how you can get it an IFPS/Personal mate. If your mainframe doesn't have IFPS yet, call or write us today and we'll help you make your decision. Execucom Systems Corporation, 3410 Far West Boulevard, Austin, Texas 78731. SOFTWARE & SERVICES

DATA BASE MANAGEMENT SERVICES

CONVERGENT SOLUTIONS, INC.
ADS Release 1.5

Convergent Solutions, Inc. has introduced Release 1.5 of its Application Development System (ADS), a relational data base management system designed for the vendor's equipment.

According to the vendor, access to the data base is through application systems built using a high-level, nonprocedural, forms-oriented language. The ADS system may be used on a stand-alone workstation or a clustered configuration.

New features of ADS include an "Accept Invisible" command for security, multiple scrollable windows and system programming language extensions.

The first cluster license is priced at $6,000 and can support up to 16 users, according to the vendor.

Convergent Solutions, Suite 900, 97-45 Queens Blvd., Forest Hills, N.Y. 11374.

INDECS SERVICES
Version 3.1 of X-Cell

Indecs Services has announced Version 3.1 of its X-Cell data management system for Digital Equipment Corp.'s PDP-11 processors in the DEC RT-11 environment.

According to a company spokesman, X-Cell is a data base and information retrieval system that features data entry and retrieval, sorting, report generation, numerical calculation and document-generator capabilities. The system is said to allow users to define and allocate field space for any combination of alphanumeric and numeric entries.

Data base switching is done through a single menu entry, and numerical data fields can be defined by linear and nonlinear functions of other numeric fields, the vendor said. Under RT-11, X-Cell requires a DEC VT100 or compatible terminal.

Version 3.1 of X-Cell is priced at $350 for a single copy.

Indecs Services, 9 Pinecrest Drive, Taunton, Mass. 02780.

VISTA COMPUTER, INC.
Datascan enhancement

Vista Computer, Inc. has announced an enhanced version of its Datascan data base management system, which is said to offer self-programming and improved query capabilities on Data General Corp. computers.

Datascan is designed for nonprogrammers and performs data management functions that include creating data entry screens and menus, reports, cross-tabulations, graphs and statistics, according to a vendor spokesman.

The self-programming feature is said to provide improved performance over fixed, table-driven systems. Datascan automatically writes custom programs for each screen, query or report, the vendor said.

A perpetual license for the product costs $20,000 for a stand-alone version or $25,000 for a DG AOS or AOS/VS operating system version, according to the spokesman.

Vista Computer, 85 Executive Blvd., Elmsford, N.Y. 10523.

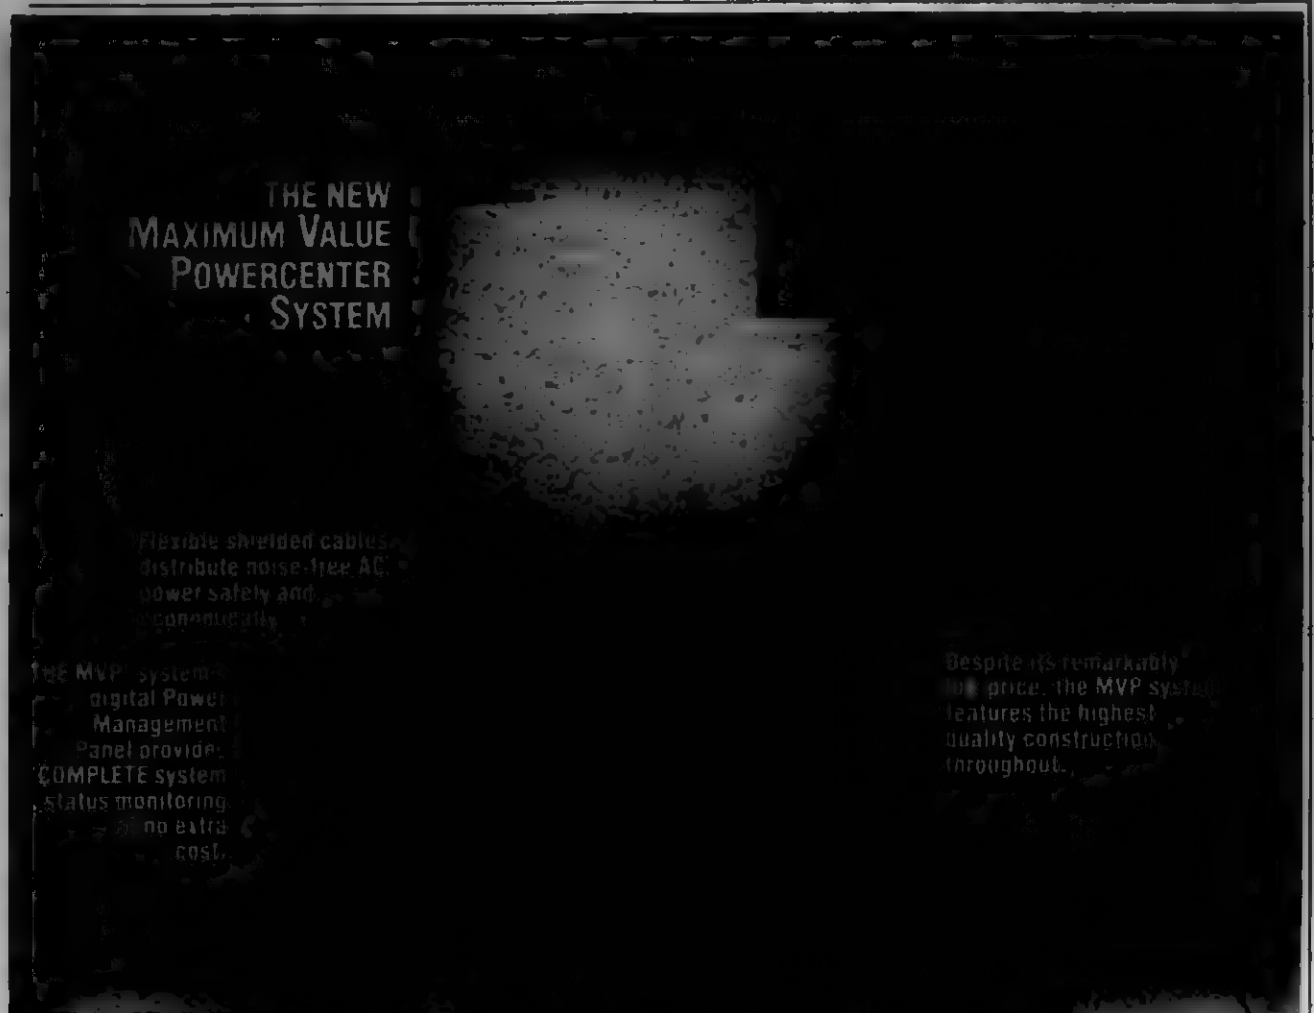
INFORMATION BUILDERS, INC.
Describing Focus Files

Information Builders, Inc. is offering a computer-aided instruction course for users of its Focus nonprocedural data base management system.

The course — dubbed Describing Focus Files — functions in an on-line, interactive mode under IBM's Interactive Instructional Presentation System or Goal Systems Corp.'s Phoenix. It is self-paced, parallels Focus classroom instruction and can be customized to fit individual requirements, a vendor spokesman said.

Describing Focus Files consists of eight integrated modules, which cover building file definitions, relational operations and data base networking. The course provides computer simulation of live Focus sessions coupled with an interactive question-and-answer format.

The course is available under IBM's VM/CMS, TSO, CICS or IMC/DC. It has a purchase price of $3,000 or is



THE SPECIFIERS' CHOICE.

Maximum value means top quality at the lowest possible price. That's what specifiers look for in a computer-room power distribution system — and that's why the new MVP™ system is the specifiers' choice.

The MVP system provides complete computer-room power distribution, and is specifically designed to meet all common industry specifications at an uncommonly low price. The MVP system uses flexible shielded cables to safely and economically distribute AC power throughout a computer room. It protects sensitive equipment against problem-causing electrical noise transients and voltage spikes. And it offers computer-grade grounding, complete power monitoring, a fully rated isolation transformer, front cable access, building-alarm interface, UPS interface, and main circuit breakers for each output load center — all as standard equipment.

Don't sacrifice quality for economy. Get both — by specifying the new Maximum Value Powercenter system from Topaz.

Specifications
Input Voltage: 480V three-phase delta; **Output Voltage:** 208Y/120 VAC; **Output Power:** 100 kVA, 125 kVA, 150 kVA; **Operating Frequency:** 57-63 Hz; **Efficiency:** 97.5% minimum; **Common-mode Noise Attenuation:** 55 dB for any frequency in 300 kHz; **Transverse-mode Noise Attenuation:** 20 dB at 100 kHz; **Voltage Adjustment Taps:** Two 2½% adjustment taps above nominal; Four 2½% adjustment taps below nominal; **Output Circuit Breakers:** Up to 126 pole positions; **Cable Positions:** Up to 75 cable positions; **Grounding Style:** Ultra-Ground® internal single-point grounding system; **Heating Loss:** maximum 85 Btu per kilowatt of load.

For complete information about this new MVP system, fill out this coupon or call us today.

available for rent at $125/mo.

Information Builders, 1250 Broadway, New York, N.Y. 10001.

SOFTWARE HOUSE, INC.
Version 2.0 of 1032

Software House, Inc. has announced Version 2.0 of its 1032 relational data base management system for Digital Equipment Corp. VAX-11 computers running DEC's VMS operating system.

Version 2.0 increases data security to the field level within a record and allows security restrictions to be set via password, user name or user identification number, according to the vendor.

The new release also allows users to change their minds about various data base defaults after loading data without dumping and reloading, the vendor said.

Version 2.0 of 1032 is licensed for $40,000 for the VAX-11/780 and $32,500 for the VAX-11/750. A 60-day, full-system trial of the product is available for $95.

Software House, 1105 Massachusetts Ave., Cambridge, Mass. 02138.

LANGUAGES

CSP, INC.
Mini-MAP Fortran compiler

CSP, Inc. (CSPI) has announced a Fortran compiler for its Mini-MAP family of array processors.

Designed to run on Digital Equipment Corp.'s VAX computers, the compiler generates code for execution on a Mini-MAP array processor interfaced to VAX-11, PDP-11 and LSI-11 products. The compiler processes Fortran statements and generates object code for direct execution by the array processor.

The Fortran compiler is priced at $7,500 and will be available in May, according to the vendor.

CSPI, 40 Linnell Circle, Billerica, Mass. 01821.

NOVELL, INC.
BI-286 Business Basic II capability

Novell, Inc. has announced that Control C Software, Inc.'s BI-286 Business Basic II interpreter works with Novell's Netware networking system.

Business Basic II is a programming language developed by Open Systems, Inc. Netware supports multiple printers, simultaneous file updating and a file manager, according to the vendor.

The system costs $520 for two to six users, $930 for seven to 12 users, $1,390 for 13 to 24 users and $1,725 for 25 to 64 users.

Novell, 1170 N. Industrial Park Drive, Orem, Utah 84057.

ON-LINE DATA BASES

DIALOG INFORMATION SERVICES, INC.
Disclosure/Spectrum Ownership

Dialog Information Services, Inc. has introduced a data base that reportedly provides ownership information for 5,000 public companies in the U.S.

Disclosure/Spectrum Ownership is said to provide financial institutions, managers and analysts with information about institutional holdings, 5% ownership details, ownership data and ownership summaries, according to the vendor.

The cost of the service is $60 per hour of connect time and $25 for each full record printed either on- or off-line, the vendor said.

Dialog Information Services, 3460 Hillview Ave., Palo Alto, Calif. 94304.

INFORMATION ACCESS CO.
Search Helper enhancement

Information Access Co. has introduced an enhanced version of its Search Helper program that reportedly reduces by more than two-thirds the cost of conducting on-line searches of the vendor's literature indexes.

The enhanced program is said to enable the user to develop search parameters off-line using Eagle Computer, Inc.'s Eagle II, IBM's Personal Computer or Apple Computer, Inc.'s Apple II series microcomputers. The program then automatically dials Dialog Information Services, Inc., Information Access' data base vendor, and calls up the appropriate literature index, a vendor spokesman said.

The cost of each search is $2.50, with up to 20 citations provided.

Search Helper is available for $1,950, a package price that includes $200 for a one-year license and $1,750 for 700 on-line searches with up to 20 citations per search. Additional packages of 700 on-line searches cost $1,750.

Information Access, 11 Davis Drive, Belmont, Calif. 94002.

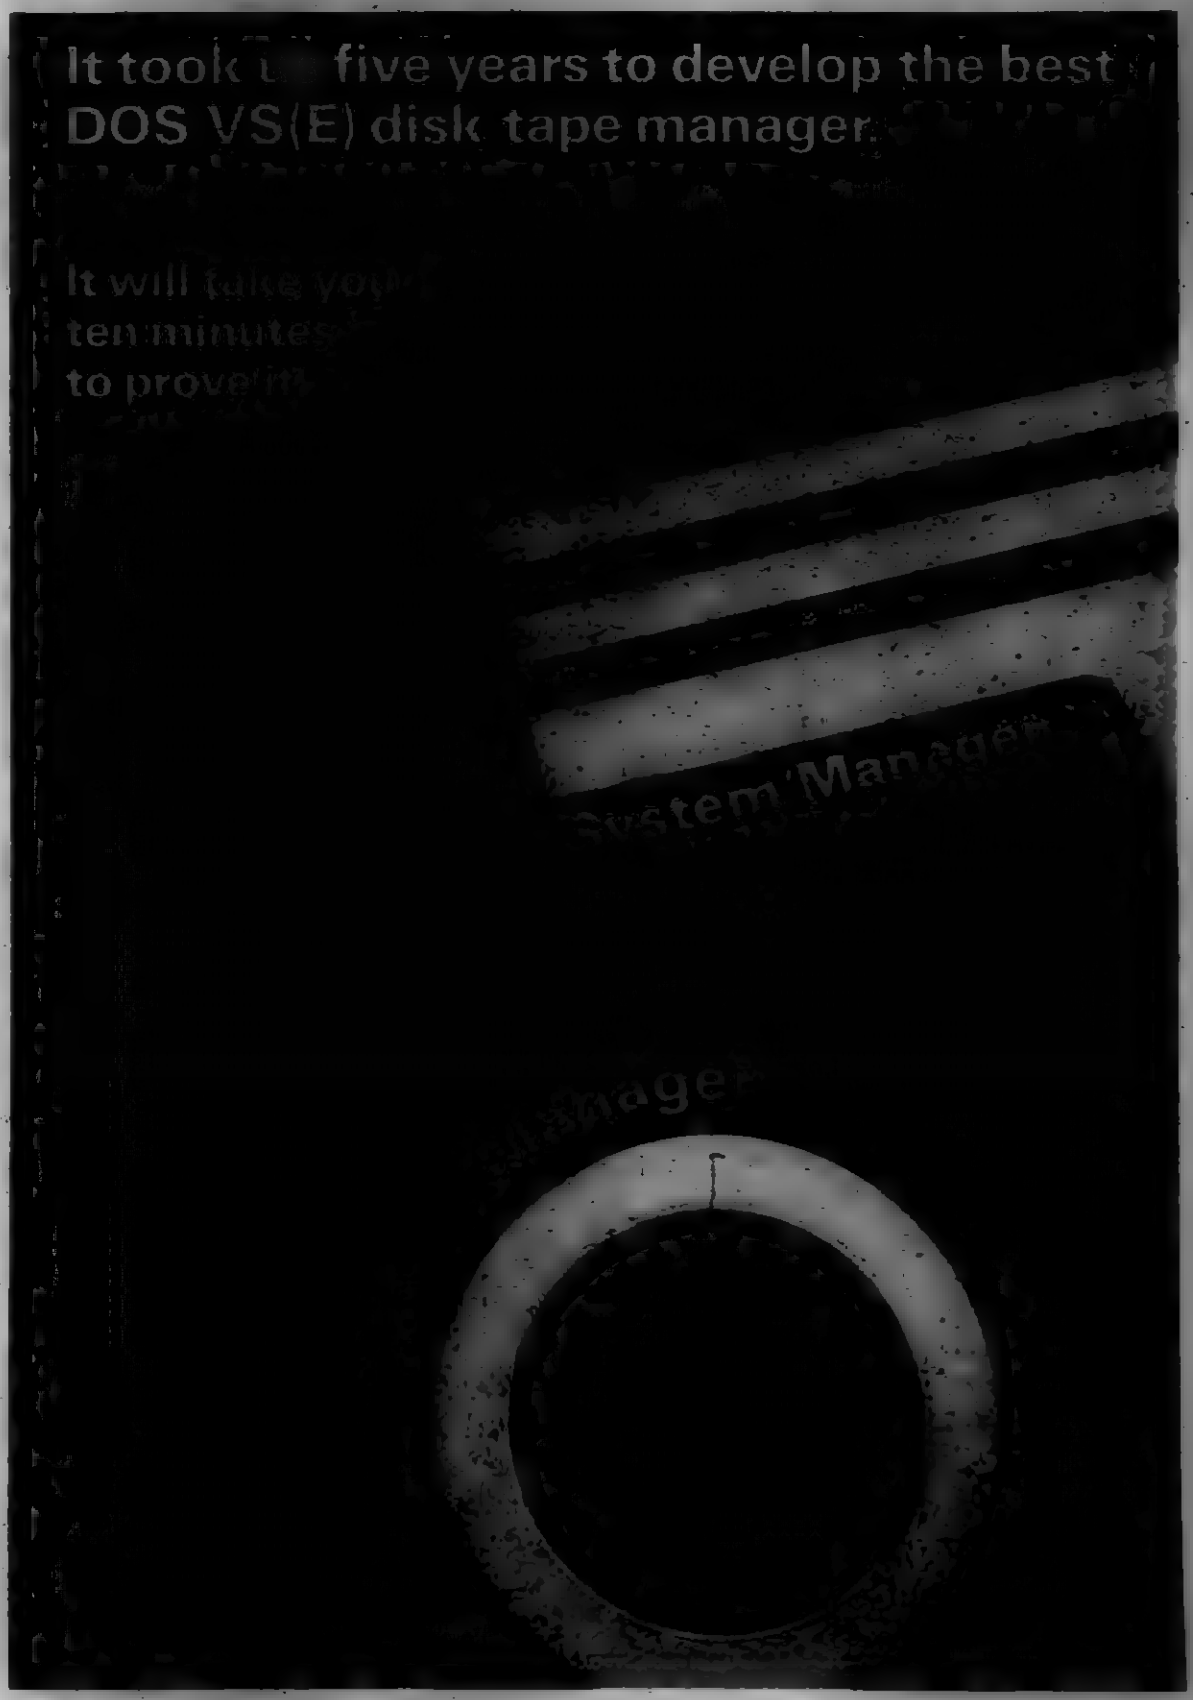
VAN NOSTRAND REINHOLD
'Software System Testing and Quality Assurance'

Van Nostrand Reinhold has published a book for software specialists on the subject of system testing and quality assurance.

Software System Testing and Quality Assurance, written by Boris Beizer, is intended as a guide to the development and maintenance of reliable, high-quality software, according to the publisher.

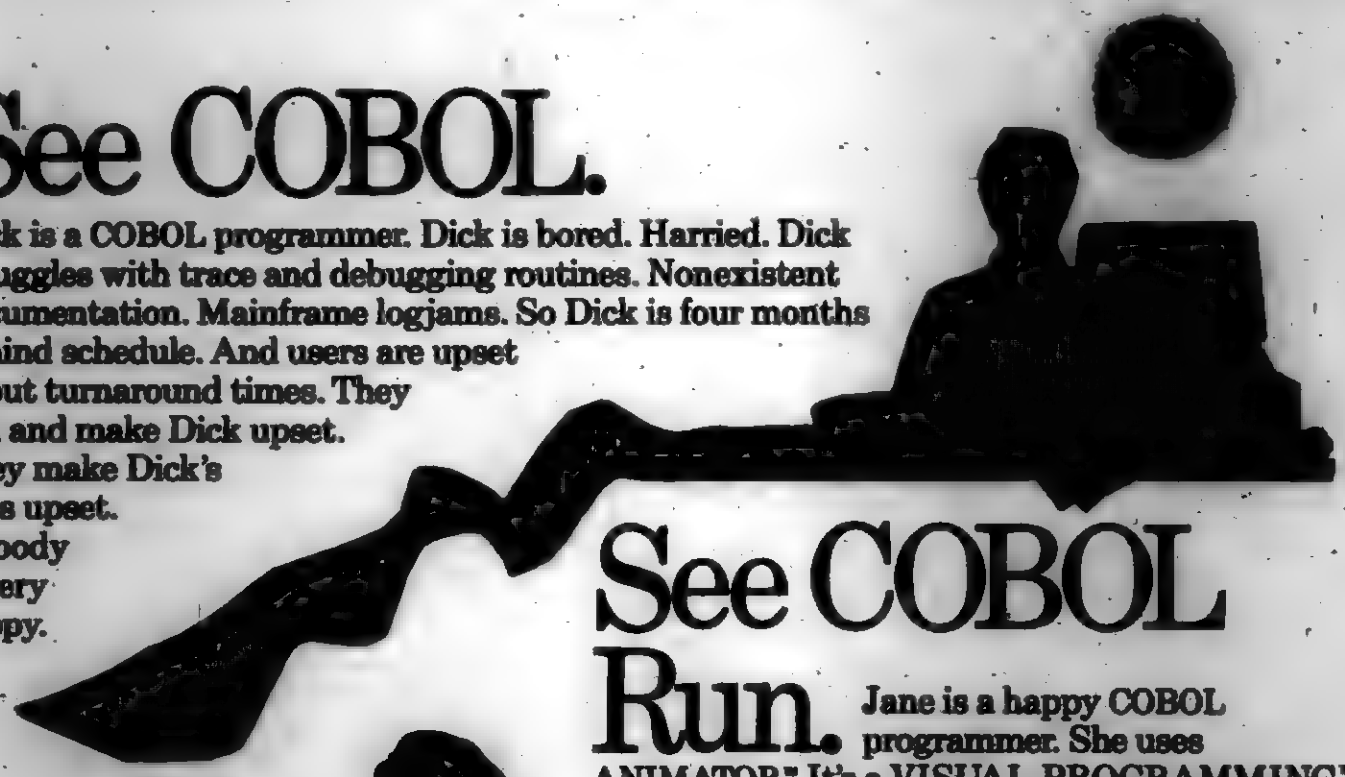
The 284-page book contains 45 illustrations and costs $34.50, according to the publisher.

Van Nostrand Reinhold, 135 W. 50th St., New York, N.Y. 10020.



See COBOL.

Dick is a COBOL programmer. Dick is bored. Harried. Dick struggles with trace and debugging routines. Nonexistent documentation. Mainframe logjams. So Dick is four months behind schedule. And users are upset about turnaround times. They yell and make Dick upset. They make Dick's boss upset. Nobody is very happy.



See COBOL Run.

Jane is a happy COBOL programmer. She uses ANIMATOR.™ It's a VISUAL PROGRAMMING™ aid for MICRO FOCUS™ LEVEL II COBOL.™ It runs on a micro. It makes child's play of mainframe test and maintenance chores.

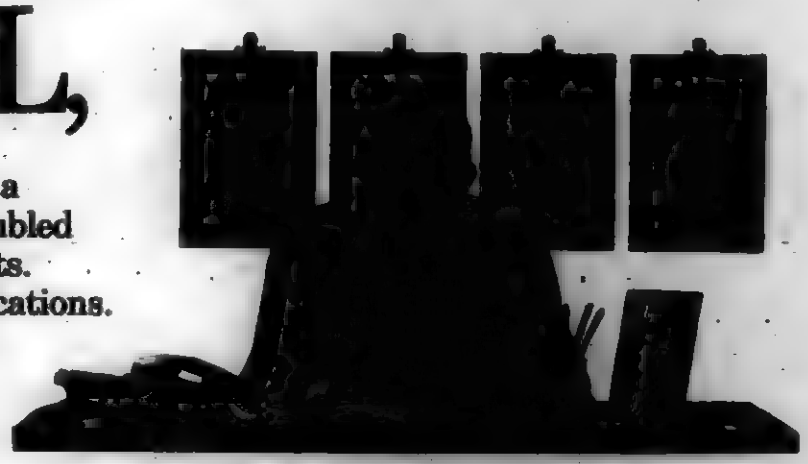
With ANIMATOR Jane sees a picture of the program explaining itself. In live action. In real time. In COBOL source code. ANIMATOR tracks the program's exact execution path. Including subroutine branches.

Jane can have the program run fast. Or slow. Or stop. With one key. This makes it easy to spot problems. Insert fixes. Set breakpoints. Instantly.

Jane's programs sometimes win awards. Yet she always meets schedules. Jane's boss likes this about Jane. Because he doesn't like users to yell at him.

Run, COBOL, Run.

This DP manager got a bonus. Because he doubled productivity. Cleared backlogs. Cut costs. Boosted morale. Produced terrific applications. Quickly. Put control and prestige back into the central DP function. And nobody yells at him anymore. All thanks to ANIMATOR.



See ANIMATOR now.

Let Micro Focus put your DP shop on the fast track.

ANIMATOR runs with MICRO FOCUS LEVEL II COBOL for compatibility with ANSI '74 High Level COBOL implementations. A mainframe-micro communications link is recommended for downloading mainframe programs.

Write for more information.
Or call (415) 856-4161. Right now.

COMMUNICATIONS

Capitalizing on divestiture: US West

Subsidiary to offer national communications services

OMAHA — US West, the regional holding company of three former Bell operating companies, is trying to capitalize on divestiture, the cause for its existence, by offering services designed to help companies stay afloat in the backwash of the Bell system breakup.

Interline Communication Services, Inc., a subsidiary of US West, will provide nationwide communications systems management services, as well as installation and maintenance support, to Fortune 1,300 companies. The company hopes to be operational in 30 major metropolitan areas by May.

"Now that the responsibility for the telephone network has been segmented among the seven new regional holding companies and AT&T," Interline President Paul J. Lee said, "telecommunications managers no longer have a single point of contact to provide nationwide support at their headquarters and branch offices. Interline's strategy is to fill that void."

Consulting and engineering services available from the new organization will

INTERLINE

reportedly include the evaluation of needs, the development of systems specifications and the recommendation of vendors whose equipment meets those specifications.

Interline said that it will not sell that equipment, mark it up or take a commission on any products that it helps to procure.

Once equipment decisions have been made, the company also offers wiring design and engineering services and will install the equipment, which may include telephone sets, cable and wire, private branch exchanges, key systems, computer workstations, data terminals, microwave links and other equipment, the company said.

At the customer's request, Interline will also act as the liaison with the local telephone company to arrange for installment of telephone trunks.

Ongoing maintenance services, provided by technicians in each branch office, are available on a contractual or an hourly basis.

All of these services are said to be available individually, according to Ronald A. Gelok, vice-president of Interline's Northeast region, so companies with large in-house communications management staffs may only use support in areas in which they are weak.

College to install outlets for micros

By John Dix
CW Staff

HANOVER, N.H. — Stereos used to be the entertainment focal point of a student's dorm room. But the personal computer may be changing that.

Harvard University said recently that beginning next year all new students in its graduate school of business would be required to have an IBM Portable Personal Computer.

Now, Dartmouth College has announced that it will wire the 30-odd dormitory buildings on its campus to provide "communications outlets" in some 2,600 rooms, a project that is being underwritten by a $500,000 grant from the Pew Memorial Trust.

Students using Apple Computer, Inc.'s Macintosh personal computers, supplied by Apple at discount rates, and a variety of dumb terminals, will be able to plug into these outlets to gain access to the college's large time-sharing computer system.

Stanley Dunten, a systems engineer with Dartmouth's Kiewit Computation Center, said that each dorm room on campus will be wired with four, telephone-type shielded wires.

All four wires will be needed to support Ascii asynchronous terminals like those networked in the college's present system (a wire each for ground, send, receive and a data terminal ready signal).

But it will be possible, Dunten said, to connect up to 32 Macintoshes on a single pair of wires configured as a bus. Access to the bus will probably be through a type of token-passing protocol that will be loaded into each Macintosh by diskette.

While the bus capability could be developed at the college, Dunten indicated a desire to wait and see if Apple will introduce a similar product, which would ensure a greater degree of compatibility with the vendor.

By using a bus to support a number of personal computers, all of the devices attached can be given host support through a single host access point. The decision to wire with four wires instead of two was made because of the need to support Ascii asynchronous terminals, and because the wire cost less than the cost to install it, Dunten said. Given unknown future requirements, this leaves more options open.

The wiring of Dartmouth is slated to be complete by the time students roll back into town next September. But there may be a hitch.

The college has coaxial cable running to some of its dorms, but for the most part circuits leased from the local telephone company are relied on to tie campus buildings together. That telephone company now says that it cannot provide more of these links because it does not have the proper tariffs to provide intra-facility leased lines between buildings.

Dunten said the older leased lines were procured through a loophole found in the tariffs by a local telephone company sales person at one time, but that now the phone company cannot put its finger on that clause.

Utility reduces errors with mobile terminals

By Lynn Haber
CW Staff

TORONTO — A major power utility here is in the process of installing mobile digital terminals in its service vehicles to reduce communications errors and lessen radio frequency interference the company was experiencing with its mobile voice/radio system.

The system, being installed for North York Hydro by Mobile Data International, Inc. (MDI) of Richmond, British Columbia, includes 80 mobile digital terminals, a base station controller and a communications controller.

Another firm, Datap Systems of Calgary, Alberta, designed the overall system and wrote the custom software.

The utility is installing the mobile terminals, which are based on Zilog, Inc.'s Z80 microprocessor and include a small monitor and 48K bytes of memory, in its field service vans, supervisors' pickup trucks and construction trucks.

Error-free messages

"Messages and forms are received error-free on the terminals and displayed or stored in terminal memory," MDI reported. "Field service personnel complete and retransmit the forms, which become part of a running record that is printed out at the host computer at the end of a shift."

Communications between the service vehicles and dispatch can be switched automatically between voice and data. Supervisors at three dispatch centers can send single messages or broadcast selectively to a group of units or to all units.

Prior to installation, communications between the central office and the field units were via a two-way voice communications mobile radio system. The impetus to move to the MDI system came from the desire to integrate the company's UHF and VHF radio systems because, as two independent systems, users couldn't talk to one another.

"We also wanted to solve some [radio frequency] overcrowding problems we had during certain parts of the day and certain times of the year," said Michael Butler, director of customer services at North York Hydro.

Another advantage of the new system is that it allows a dispatcher to control the voice/radio system. According to Butler, with the old system, anyone could use it at any time by simply picking up a microphone, keying it and talking. Now a dispatcher controls all communications.

Use drastically reduced

Butler said that with the new system, the use of voice communications has been drastically reduced, and the majority of communications with the service vehicles is via the terminals. "This is one of the things we were hoping for. Now we have virtually no traffic [radio frequency] congestion, which means we're more effectively utilizing the frequency resources

See MOBILE page 68

Interface options let devices with BSC access Ethernet

CUPERTINO, Calif. — Bridge Communications, Inc. has introduced two interface options that reportedly allow any computer device equipped with IBM Binary Synchronous Communications (BSC) capability to access Xerox Corp.'s Ethernet local-area network.

Designed for use with the vendor's Communications Server (CS/1 and CS/100) network units, the CS/1-BSC and CS/100-BSC reportedly permit any computer or peripheral that communicates as an IBM BSC 3270- or 2780/3780-type device to utilize Ethernet for interoffice and internetwork communications.

The CS/1 allows up to 32 devices with RS-232 or RS-432 serial interfaces to connect to an Ethernet network, the vendor said. The CS/100 links up to 10 RS-232 devices to Ethernet.

The CS/1-BSC, a CS/1 with the BSC interface, is available for $9,900. The CS/100-BSC with four ports is priced at $3,900; with 10 ports, it costs $4,900, according to the vendor.

Bridge Communications is located at 10440 Bubb Road, Cupertino, Calif. 95014.

Microband's Urbanet will go into operation in fall

WASHINGTON, D.C. — Interactive information services that are selected using a Touch-Tone telephone and displayed on a standard TV screen equipped with an interface device is one likely application of Urbanet, a wideband transmission system slated to be put into operation in New York, Washington, D.C., Milwaukee and San Francisco this fall.

Urbanet was developed by Microband Corp., a specialized common carrier that distributes pay TV programs through omni-directional transmitters in major cities. Microband is a subsidiary of Tymshare, Inc.

Initially designed as a cheaper, more quickly implemented alternative to CATV, Urbanet will use microwave, one-way, addressable broadcast television technology. Viewers will receive the signals through a small antenna and an interface unit referred to as a "down-converter."

Later this year, Microband hopes to implement a system allowing subscribers to order specific TV programs using Touch-Tone telephones. By dialing a local phone number the subscriber will be connected to one of the 1,200 nodes of Tymnet, the packet-switched communications network operated by a subsidiary of Tymshare.

Computerized voice system

A computerized voice system will guide the user in the selection of a program, which he will pick by punching a code number into a Touch-Tone key pad. This information, in packetized form, will then be routed by Tymnet to the Urbanet control center.

This capability will eventually enable the company to offer teleshopping and telebanking services, as well as the downloading of software to personal computers within the next few years, claimed Microband Board Chairman Mark Foster.

In addition to the cities scheduled to have Urbanet services this year, Microband has signed agreements to provide services in 1985 to Chicago; Philadelphia; Norfolk, Va.; New Orleans; Portland, Ore.; Kansas City, Kan.; Pittsburgh; Boston; and Tampa, Fla. Agreements are also being negotiated in about a dozen other cities as well, Foster said.

MOBILE from page 67

available to us."

System implementation was begun in October 1983. Total benefits of the new communications system won't be realized until it is completely in place.

In the future, Butler said the mobile computer system will be interfaced with other computer systems used by the utility, providing access to the in-house batch computer that handles trouble calls.

'The boss said he's going to replace me with a computer if he can ever find out what it is I do.'

INTELLECT.
NO SOONER SAID THAN DONE.

To use INTELLECT, the natural language query system, all you have to do is ask—in everyday conversational English—and you'll retrieve. Immediately, in either text or full-color graphics.

INTELLECT, the world's only successful true natural-language query system, is an ideal tool for your information center. INTELLECT's powerful information retrieval capabilities are so advanced that it understands questions and responds with answers as if you were talking to a knowledgeable colleague. Executives access data themselves—more easily than ever before—without learning any technical jargon or "computerese." It's so easy to use, it doesn't even have a training manual!

Whether you use INTELLECT as a retrieval system or as an effective data analysis tool, it transforms raw data in the data base into information and presents it in finished color graphics in a matter of seconds. It's a live dynamic interface that fully integrates your existing database and graphic systems.

Already hard at work in hundreds of organizations, INTELLECT is ideal for marketing, finance, personnel, manufacturing, and banking applications.

INTELLECT is an important technological breakthrough. You can learn more about it by attending one of our nationwide seminars. Or put its amazing power at your fingertips in minutes with one of our demonstration tapes.

Call or send coupon for more details. Look into INTELLECT, and be an eyewitness to the future of computing.

Tell me more about INTELLECT.

NCR COMTEN, INC.
3650 Models G8, H9, J8, K9

NCR Comten, Inc. has announced four models of its 3650 communications processor, each supporting up to 1M byte of memory in front-end and remote communications processor configurations.

The new 3650 models provide the same footprint characteristics as the recently announced 3650 Models G8 through K8 communications processors. Models G9 and H9 are for front-end configurations. Models J9 and K9 are remote concentrators, the vendor said.

The price for the front-end models configured with 512K bytes of memory, one IBM Channel Interface Adapter, a program load device and one communications interface module with attachment interfaces for eight modem interface modules is $44,000.

The price for remote communications processor models configured with 512K bytes of memory, one communications interface module with attachment interfaces for eight modem interface modules and one NCR Comten DLC modem interface module for remote initial load capacity is $46,000. A 512K-byte increment of memory is available for $18,800.

NCR Comten, 2700 Snelling Ave. N., St. Paul, Minn. 55113.

VOICE/DATA COMMUNICATIONS

NORTHERN TELECOM, INC.
V.35 ADM

Northern Telecom, Inc. has announced the V.35 Add-On Data Module (ADM), a version of the ADM for use with its SL-1 digital private branch exchange.

The device provides CCITT standard V.35 interface capabilities while supporting all synchronous data features and capabilities of the SL-1 ADM, the vendor said.

The product permits synchronous data transmission at rates up to 56,000 bit/sec. It reportedly can be used with any synchronous protocol.

The price is $1,100.

Northern Telecom, 1001 E. Arapaho Road, Richardson, Texas 75081.

MULTIPLEXERS/MODEMS

AUSCOM, INC.
Model 8300 high-speed channel interface

Auscom, Inc. has announced the Model 8300 high-speed channel interface, designed to provide single-board interface to IBM byte multiplexers, block multiplexers and selector channel devices that have a serial or parallel interface.

The product operates under the control of its own on-board processor and can emulate any one of several control units, according to the vendor.

It can transfer data at rates of up to 500K bit/sec and also features a random-access memory buffer of up to 16K bytes.

The Model 8300 high-speed channel interface is priced at $6,000, the vendor said.

Auscom, Suite 102, 2007 Kramer Lane, Austin, Texas 78758.

RACAL-MILGO, INC.
Modem 112K

Racal-Milgo, Inc. has announced the Modem 112K, a 112K bit/sec modem designed for use in wideband carrier systems such as microwave and/or satellite networks.

The modem features full-duplex operation and manual down-speed switching for compatibility with the company's Modem 56K and for transmission over degraded communications lines. The modem incorporates diagnostics such as analog loop-back, data terminal equipment loop-back and data test, the vendor said.

The price is $16,500.

Racal-Milgo, 8600 N.W. 41st St., Miami, Fla. 33166.

EMULEX CORP.
CS32; Statcon Series 32

Emulex Corp. has announced the CS32 and the Statcon Series 32 communications multiplexers, which offer Digital Equipment Corp. VAX-11 series users expanded asynchronous line capabilities.

The CS32 is an asynchronous communications multiplexer subsystem capable of supporting up to 128 users. All CS32 lines have full modem control. The printed-circuit board controller installs in a DEC Unibus slot in a VAX-11 Unibus adapter chassis and requires only 4A of power from a 5V power supply.

The Statcon Series 32 adds multiple-link statistical multiplexing to the CS32 and is capable of handling up to 256 local/remote lines by the addition of from one to 16 CM32 port concentrators. The CM32 port concentrator is the link interface between the controller and the EM8320 remote data concentrator, according to Emulex.

Functionally, the CM32 handles the link initialization and synchronization, link configuration, retransmission-on-error and other dialogue with the remote data concentrator, the vendor said.

The price for the 16-line CS32 is $5,000. The 16-line Statcon Series 32, which includes the first CM32 port concentrator, is $8,100.

Emulex, P.O. Box 6725, 3545 Harbor Blvd., Costa Mesa, Calif. 92626.

"The 128 channel UNIMUX™ from Fibronics has the power to solve your trunking and multiplexing problems."

IN A GROWTH MODE? REORGANIZING YOUR INFORMATION TRANSFER SYSTEM? Now is the perfect time to learn about the cost-effective features of UNIMUX, Fibronics' universal time division multiplexer. The UNIMUX eliminates the need for line drivers, avoids noise problems, and offers EMI, RFI, and EMP immunity.

- Expandable from 4 to 128 v.24 or v.25 ports
- Full duplex, high speed communications to 64 KBPS (RS-232C or v.35)
- Synchronous/Asynchronous operation, each channel independent
- Communicates over one fiberoptic or coaxial cable
- Built-in test diagnostics with status indicators

Call today for a free brochure (617) 778-0700, or write UNIMUX, Fibronics International Inc., 218 West Main Street, Hyannis, MA 02601

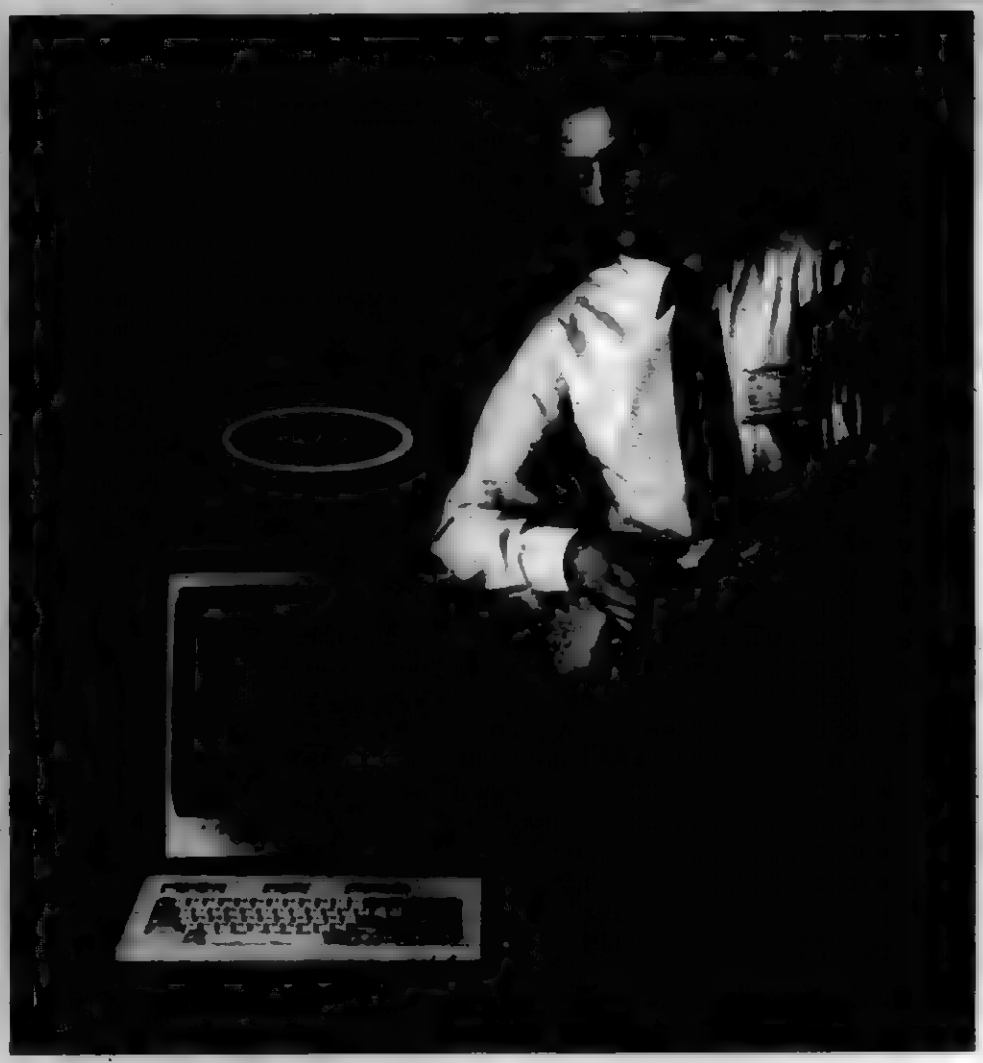
HOW THE TERMINALS THAT GIVE YOU SO FEW PROBLEMS CAN WIND UP GIVING YOU NONE AT ALL.



While we at Teletype Corporation like to talk about our terminals' remarkable record for reliability, we have to admit that every once in a while you just might have a problem with one.

But if you contract with Teletype's Product Service Organization, getting good service is no problem at all. That's because no one can service our full line of CRTs and teleprinters as well as our service technicians. Each one of them is a company-trained, job tested professional who must continually meet our expectations—and yours.

Help is never more than a phone call away since our technicians are on-call 24 hours a day, 7 days a week. And with our network of 100 offices nationwide, we're able to provide fast response time, even to remote areas. You can contract with us for response times as low as 2 hours, or less, as your needs dictate.

But at Teletype, we feel there's something more important than fast response time. And that's fast restoral. So when our technicians call on you, they'll have the necessary test equipment and original Teletype® parts to get your terminals up and running in no time flat.

We'll even help solve problems before they occur with scheduled preventative maintenance. You can also choose our installation service option that includes everything from getting your terminals on-line to user orientation. It's all a part of our Full Service Maintenance Agreement.

So to keep your problems from becoming big problems, write Teletype Corporation Product Service Organization, 2330 Eastern Ave., Dept. 2800-A Elk Grove Village, IL 60007. Or call toll free at 800-323-4226, ext. 300. (In Illinois, 1 800 942-4192, ext. 300.)

IN DEPTH

An index of 1983 In Depths and Special Reports

In Depth presented 114 stories in 1983, full-length features on topics as diverse as software maintenance and protection, user friendliness, subsecond response time, relational data bases, computers in Japan and The People's Republic of China, SNA, the Cobol validation facility, computermarts, advertising and information centers. We interviewed Tom Watson Jr., William Norris and John Kemeny. We ran articles by such writers as Alan Westin and Peter Keen and excerpted *The Fifth Generation* and *High Output Management*.

And each month, the Special Reports section of *Computerworld* provided dozens of tutorials and applications stories targeted on one topic.

This index is intended to help readers locate articles on particular topics of interest from last year.

To order a back issue, write: Circulation Department, Customer Service, *Computerworld*, P.O. Box 880, Framingham, Mass. 01701. Each issue costs $1.50 prepaid. Issues published on Feb. 21, Feb. 28 and June 20 are not available.

In Depth articles:

Electronic Spread Sheet for VM/CMS & MVS/TSO

- Not Just Another CALC -

Powerful - Spreadsheet size is limited only by available virtual storage. ESS easily handles spreadsheets with thousands of rows and/or columns.

Proven - Already in use at over 100 installations.

Compatible - ESS accepts the same commands as VisiCorp's VisiCalc® program for microcomputers. A person familiar with VisiCalc® can be using ESS productively in minutes. In addition, ESS can load and save files in VisiCalc® format.

High Performance - Assembler language code and sophisticated storage management techniques give you fast response, even with very large spreadsheets.

Easy to Install - Just load the ESS program. No additional program products or languages are required.

Cost Effective - ESS gives all your users access to personal computing capabilities for just $220 per month. Compare that to the cost of buying hundreds of microcomputers.

Questions? - For more information about ESS, or to arrange a 30-day free trial, call or write TRAX.

Controls on software

What can be exported where

Federal law prohibits unlicensed export of "technical data" and certain commodities. All software is technical data since by its very nature, a computer must use software to be utilized. There are two federal statutes all exporters must be aware of: the Export Administration Act and anti-boycott legislation.

By L.J. Kutten

U.S. statutes place firm controls over the export of software, whether it be developed in-house for internal use within a multinational company or for sale by a vendor. Failure to understand the terms of these statutes could bring substantial penalties for the user or exporter.

Federal law affects exactly what can be exported and to where. All exporters must be aware of the Export Administration Act (EAA) and anti-boycott legislation.

The EAA [now being considered for revisions] and its applicable regulations prohibit the export of "technical data" and certain commodities listed on the Controlled Commodity List (CCL) without prior authorization from the Department of Commerce Office of Export Administration (OEA). Copies of the regulations are available from either the Government Printing Office or the local field office of the Department of Commerce.

Exports of commodities and technical data from the U.S. are controlled for three government policy purposes:

National security: The EAA prohibits export of those items that could make a significant contribution to the military potential of another country to the detriment of the U.S. Even the video display chips in many arcade games have military applications.

Foreign policy: Export controls can be used to implement foreign policy interests of the U.S. After the Soviet incursion into Afghanistan, for example, President Carter banned certain exports to the Soviet Union.

Domestic short supply: The government may wish to prevent excessive drain of scarce materials from the U.S. economy.

The CCL states what goods can be exported to what countries under what conditions. It has divided the world into a number of country categories (see Figure 1 on ID/4).

A company does not need export authorization for commodities and technical data intended for use or consumption in Puerto Rico or any other U.S. possession, territory or dependency. They are

considered domestic shipment, but a shipper's export declaration must usually be submitted.

Unless nuclear energy is involved, a firm does not need an export license for commodities or technical data that will be used or consumed in Canada. A shipper's export declaration may be required.

The OEA export control authority extends to:

- Export of commodities and technical data from the U.S.
- Re-export of U.S. origin commodities and technical data from one foreign destination to another.
- Exports and re-exports from a foreign country of foreign products containing U.S. origin parts and commodities.
- Exports and re-exports from a foreign destination of foreign products based on U.S. origin technical data.

Warning: An exporter is also liable if the foreign importer re-exports the software to a prohibited country.

Exactly what is prohibited?

Federal law prohibits unlicensed export of "technical data" and certain commodities.

"Technical data" is defined by federal regulation: "Information of any kind that can be used or adapted for use in the design, production, manufacture, utilization or construction of an article or material. The data may take a tangible form such as a model, prototype, blueprint or an operating manual; or it may take an intangible form such as technical services."

All software is technical data since by its very nature, a computer must use software to be utilized. It does not matter if it is a video arcade cartridge or program controlling a nuclear reactor. It may seem strange that all microcomputer software, including a video game like Pac-Man, is included as technical data. The Commerce Department has been asked and has refused to waive any type of microcomputer software from the regulation.

Among the commodities specifically controlled are:

1. All magnetic media, except that made specifically for voice and music recording. This group includes floppy and hard disks and all magnetic tape made especially for computers.
2. Computer-aided design and manufacturing (CAD/CAM) software usable in the design or manufacture of integrated circuits.
3. Software designed for use with numerically controlled machine tools.
4. Software designed to control or perform the function of cryptographic equipment (code machinery).

If your software involves one of these areas, obtain legal advice in writing before proceeding.

Warning: Software is considered two items. You will need two separate licenses to export software stored on a magnetic medium — one for the software and one for the medium.

Getting the export license

OEA regulations provide for two main types of export licenses:

Validated license: This formal license is issued by the OEA after reviewing the written license application. It permits the exporter to ship a specified commodity to a named consignee in a particular country for a designated use.

General license: This license permits export without the exporter having to submit a license application.

A general license is effective immediately upon the exporter's satisfaction of regulatory requirements. A validated license can take up to six months of review. Validated licenses are primarily used for large projects such as plant construction, highly sensitive information, exports to restricted countries and so on.

Most software can be issued under a general license. There are two types: the General Technical Data Available (GTDA) and General Technical Data Restricted (GTDR).

The simpler is the GTDA. It covers all materials that "have been made generally available to the public in any form including: 1) data released orally or visually at open conference, lectures, trade shows or other media open to the public; and 2) publications that may be purchased without restriction at a nominal cost or obtained without cost or are readily available at libraries open to the public."

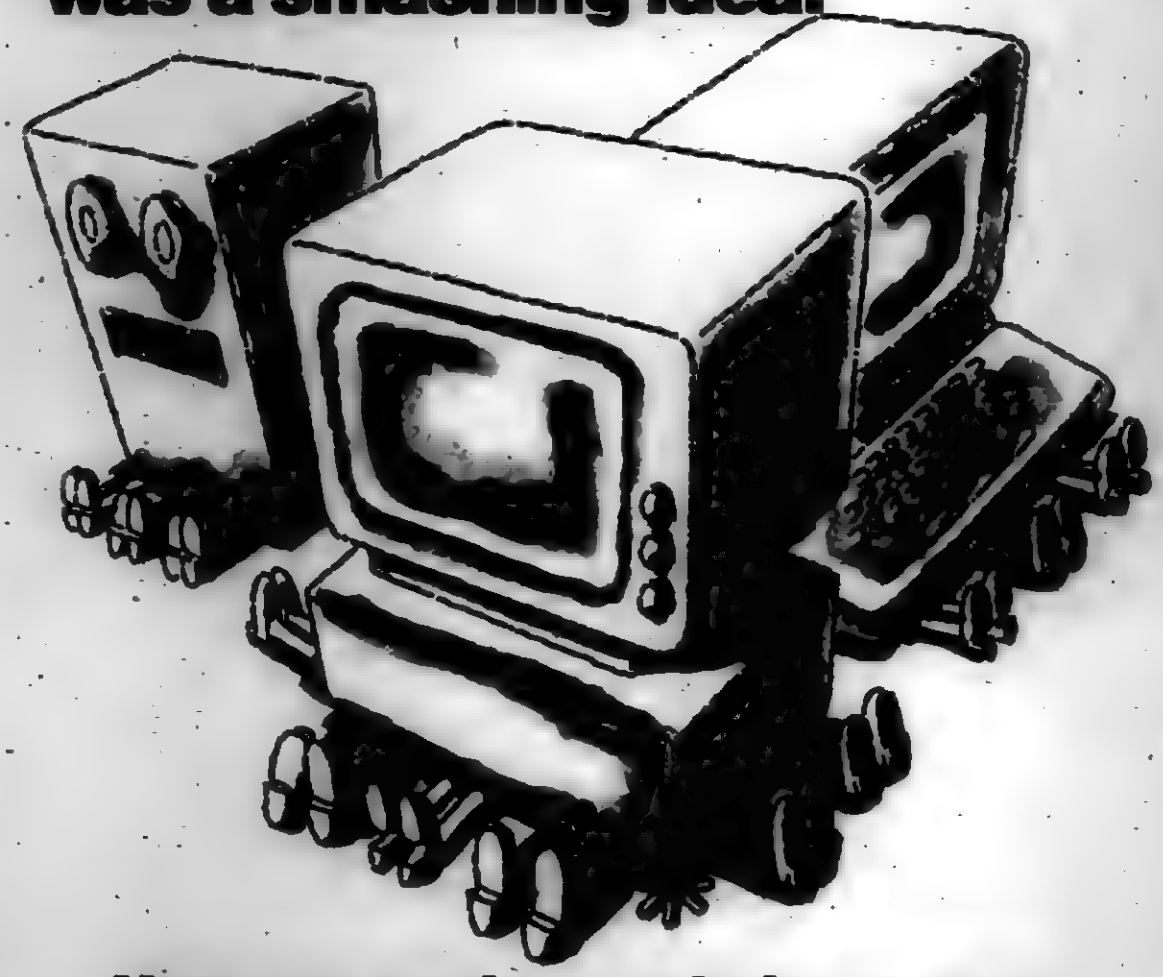
Providing your employees with the latest office technology was a smashing idea.



Now you need one solution to keep them on top of it all.

With all the subtlety of a bomb, technology has arrived in your organization. And its effect on productivity can be devastating. Even your most skilled, most motivated employees may be hard-pressed to keep up.

The solution is comprehensive, continuous education and training. And DELTAK, the world leader in training programs and services, can help.

For your DP professionals, there's a wide range of job-specific multimedia and computer-based skills courses. For managers and end users, we offer microcourseware and video briefings covering critical business issues.

And to complete your expanding training needs, DELTAK now provides comprehensive consulting, professional classroom instruction and major city workshops.

So call today and find out how DELTAK can help your people stay on top of some very pressing problems.

THE FIRST MOBILE COMPUTER.

THE COMPLETE COMPUTER FOR THE MOBILE PROFESSIONAL.

Professionals on the move in today's productivity-paced business environment have to run a little faster just to keep up.

They can easily spend half their time in airports, taxis, lobbies and hotels unable to do the work they'd like to get done.

But we have a solution.

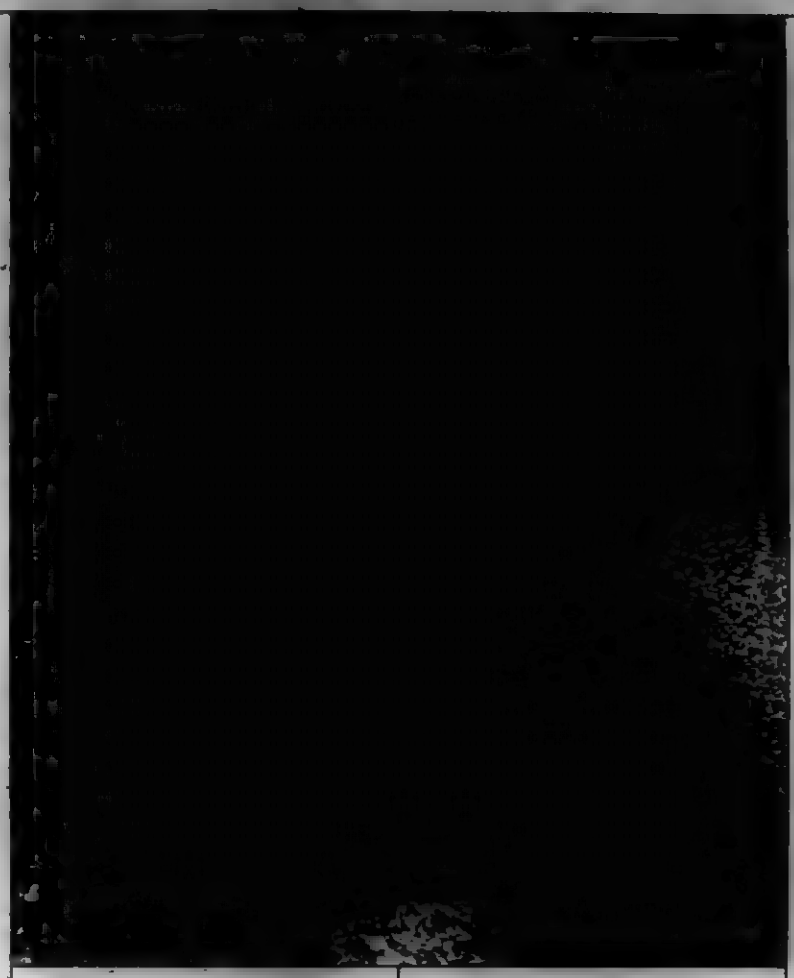
Give them the powerful 9 pound, 16-bit computer that works when and where they do.

Give them an advanced battery-powered printer that attaches securely on the computer.

Give them an interactive human interface and operating environment that takes only 15-30 minutes to learn.

And unique field-oriented software that comes in rugged plug-in capsules.

In short, give them the Gavilan™ mobile computer.



PORTABLE TURNED PRACTICAL.

Never has there been a complete business computer system as sophisticated, yet as lightweight, as the Gavilan.

Self-contained, rechargeable 8-hour batteries free the user from external power constraints.

The 8 line X 80 character screen eliminates the need for an external monitor, although you can add one if you wish.

The full-size typewriter keyboard makes data entry as convenient as it is in desktop systems.

A built-in 3½" microfloppy disk drive and modem provide the capabilities of data handling and transmission where they never before existed.

And a 50 character per second printer gives the mobile professional in the field the immediacy of hard copy text, forms, charts, spreadsheets and graphics.

All in a compact 14 pound mobile office.

WE BUILT A MORE MOBILE MOUSE.

The success of any computer depends in part on the "friendliness" and accessibility of the user interface.

Especially in the field.

A standard mouse interface is fine for the expanse of a desktop, but not for work on the move.

So with the Gavilan, we incorporated a built-in touch panel: the first fully integrated computer mouse.

It's a pressure-sensitive pad just above the keyboard. Finger movements across the touch panel control the on-screen movements of a cursor.

But like a mouse, the Gavilan touch panel actually executes virtually all of the user commands, saving the keyboard for typing only.

Through the touch panel, users store and retrieve data. Cut and paste. Move documents. Scroll through pages of information. Zoom out for a complete look at the format of a document. Or even ask the computer what just happened and what to do next. With one finger.

SOFTWARE IN A CAPSULE.

The intuitive ease of talking to the computer through the touch panel is made possible by the unique Gavilan operating environment and software packages.

The applications packages come in durable capsules called CapsuleWare.™ They plug directly into the body of the computer, adding no additional volume. The operating software, (GO System™) then lets each of the applications communicate with each other through a common interface and a sharing of data.

The result is a completely integrated information environment that lets the user combine spreadsheets, graphics and word processing text together.

All in the same uninterrupted user mode.

OUTWARD MOBILITY FOR USERS, UPWARD MOBILITY FOR OEMs.

The Gavilan mobile computer and its CapsuleWare programs are creating vertical market demands—both in MS/DOS and the Gavilan operating environment—for software packages completely unrealized one short year ago.

That means new opportunities in applications development far beyond the typical office-bound programs. From air and sea navigation to banking services. Journalism to field auditing. Anthropology to insurance.

And that means you've got the chance to be first in your chosen field.

A position we strongly advocate.

Gavilan Computer Corp.
P.O. Box 5004
Campbell, CA USA 95008
(408) 379-8000
Telex 4991278 GVLN US

Gavilan

Gavilan, CapsuleWare and GO System are trademarks of Gavilan Computer Corporation. MS/DOS is a trademark of Microsoft Corporation.

The term "nominal cost" is also defined: "realistically only the cost of preparing and distributing the publication and not the intrinsic value of the technical data. If the cost is such as to prevent the technical data from being generally available to the public, the . . . [GTDA] would not be applicable."

A safe bet would be that only public domain software could be exported under the GTDA. Software that the seller purports to license only would not be included. Software that qualifies for the GTDA may be exported to any country.

If the software does not qualify for GTDA, then the more restrictive GTDR applies. To use a GTDR, the exporter must receive a written letter of assurance from the foreign importer and/or distributor that the software will not be re-exported to another country. This assurance should be on the importer's letterhead and state that neither the technical data nor its direct product will be shipped either directly or indirectly to any country listed in Groups Q, S, W, Y, Z or Afghanistan.

Regardless of the importer statements, an exporter has a duty not to export if it has reason to believe the software would be re-exported. The more sensitive the software that is involved, the more diligence required.

Warning: All technical data, even that which qualifies for a GTDA, exported to Libya, Cuba, Vietnam and Kampuchea and most technical data exported to country groups Q, W, Y and Afghanistan, requires a validated license.

If an exporter is sending magnetic media to country groups T, V and Canada, he only needs to obtain a validated license if the shipment is worth more than $1,000. For values less than $1,000, he may mark the package "GLV" (General Limited Value).

Export declaration

Besides the export license, the exporter must file a shipper's export declaration (SED) at the place of export (or with the postmaster, if mailed) if the value is more than $500. The declaration must contain the official symbol for the license used, descriptive information on the type of goods being shipped and the Commodity Control Number if the goods are on the CCL.

Warning: Even though the declaration is only required when the value is more than $500, there is a question whether it applies to the value of blank media or the value of the recorded software. As discretion is the better side of valor, file a declaration whenever the value of the licensed software exceeds $500.

If a shipment is exported without the proper license or later diverted to a nonapproved destination, severe penalties can be applied. Civil penalties of up to $10,000 may be imposed administratively (that is, without a trial, judge or jury) for each violation, along with prohibiting either the U.S. or foreign party from exporting any goods from the U.S. for a specified time. Future licensing can be conditioned upon 1) payment of the fine or 2) posting a bond to cover the fine while the exporter litigates it.

Criminal penalties for knowingly violating the act can range up to five years in jail and a $50,000 fine (or five times the value of the goods, whichever is greater).

If technical data or restricted commodities are exported to countries in groups Q, S, W, Y, Z or Afghanistan, and they have military or cryptographic capabilities (I have seen commercial micro software which I feel would apply), the exporter can go to jail for 10 years and be fined up to $1 million.

Filing a false declaration also violates the False Statement Act. Such a violation is criminally punishable by a fine of up to $10,000 and imprisonment of up to five years.

Finally, any commodity and technical data shipped in violation of the EAA can be seized and declared forfeited. The government can auction the confiscated material to the highest bidder.

Anti-boycott legislation

Historically, the U.S. opposes restrictive trade practices or boycotts imposed by one foreign country against other countries considered friendly to the U.S.

The EAA codifies this opposition. U.S. corporations

A few graphic words from our InterTest™ users:

"Testing without InterTest is like climbing a mountain without a rope."

dealing in foreign trade have an obligation to comply with the law and report the boycott request to the Commerce Department. The law specifically prohibits U.S. citizens or corporations from:

- Refusing to do business with any blacklisted firm or boycotted country that is deemed friendly to the U.S.
- Discriminating against any U.S. citizen on the basis of race, religion, sex or national origin in order to comply with a foreign boycott.
- Furnishing information about their business relationship with boycotted countries or blacklisted companies.

Violation of the boycott provisions brings civil penalties of up to $10,000 per violation and suspension of export privileges. Criminal penalties include fines of up to $50,000 and imprisonment.

Need for local counsel

Before signing any contract with a business located in a foreign country (including Canada), an exporter should seek competent advice from an attorney in that country. What may be a general rule of business in the U.S. can violate the law elsewhere. Do not let your American counsel convince you that it can provide worldwide legal advice.

Example: In 1982, Mexico amended its Law on the Control and Regulation of the Transfer of Technology and the Use and Exploitation of Patents and Trademarks to include software specifically. Any license agreement not registered with the state is unenforceable and the parties are subject to a large fine. Among the reasons provided by the law for refusing to accept registrations are:

1. Excessive royalties (more than 3% to 4% of the net sales).
2. Any clause requiring return of the knowledge at the end of the license and cessation of use of the technology.
3. Excessive term — any clause that requires the licensee to maintain confidentiality after the expiration of the agreement violates this prohibition.
4. Any clause prohibiting the Mexican licensee from exporting its product.
5. Any clause subjecting the contract to non-Mexican law or a non-Mexican court.

Before signing any contract with a business located in a foreign country (including Canada), an exporter should seek competent advice from an attorney in that country.

It is very possible that once the license expires, the licensee may have an unrestricted world use to market the product.

Example: Assume you license a Mexican licensee to produce a Spanish version of Mathcalc. At the end of 10 years, the Mexican licensee could lawfully sell the program worldwide under the Mathcalc name. The fact that the version sold is not the current version will do you, the owner, more harm than the former Mexican licensee.

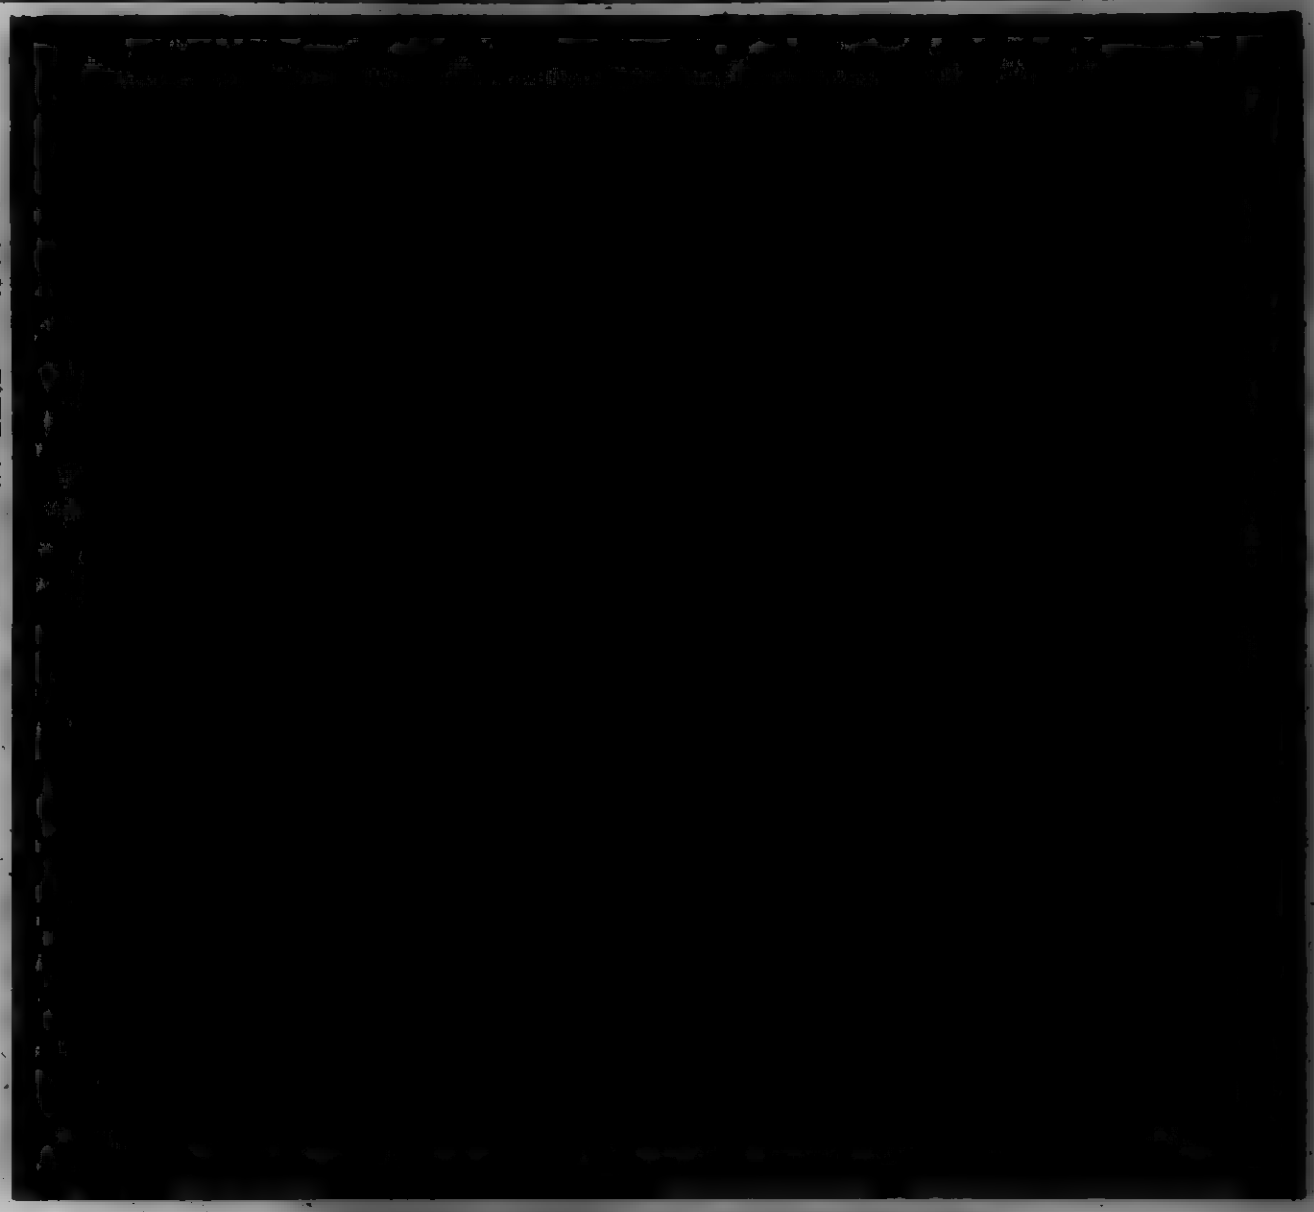
To find the names of foreign attorneys, contact either the American embassy in that country or the country's embassy in Washington, D.C. You can also find many names in the *Martindale Hubble Law Directory*, a multivolume set published each year. It lists every American attorney and many foreign attorneys and can be found in most law libraries or court houses.

Warning: In the nondemocratic countries, justice is often arbitrary. Getting contract enforcement against a prominent official (or a relative) can be an exercise in futility. Delays of five to 10 years are not uncommon.

Import Duties

Import duties differ from country to country. You can obtain current information from the country's embassy or consulate. Find out how software is classified in that country. Find out if the duty is levied on the actual selling price, manufacturing cost or replacement value.

Consider setting up "software libraries" abroad where your software can be duplicated. For example, setting up such a library in the European Economic Community can save considerable import duties in all the EEC countries.



MULTIPLE CHOICE: The UDS Modem Family

SPEED RANGE (bps)	DIAL-UP NETWORK MODEL	DIAL-UP NETWORK PRICE	PRIVATE LINE MODEL	PRIVATE LINE PRICE	LINE POWERED MODEL	LINE POWERED PRICE

SAS/GRAPH, Tektronix 4105 and 4695...

Your Low-Cost Graphics Solution

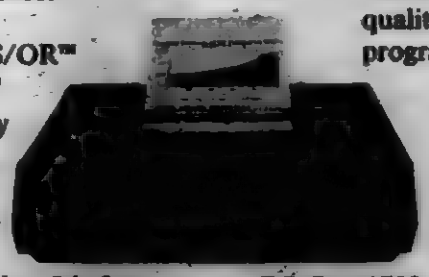
Since its beginnings, SAS Institute Inc. has provided you a "state of the art" software system. Now the Institute and Tektronix, Inc. give you a low-cost graphics solution—SAS/GRAPH,™ the Tektronix 4105 and 4695.

With SAS/GRAPH, you can produce sophisticated charts, plots, maps and three-dimensional displays with just a few simple statements. SAS/GRAPH can help you analyze data and results, and discover trends. Then you can add colors, titles, footnotes, company logos and other information to present your results to others.

What's more, SAS/GRAPH is integrated with the SAS System, so you can:

- use the data management, statistical analysis and report writing tools in SAS®
- enhance your forecasts and financial reports produced with SAS/ETS™
- clarify your data entry, editing and spreadsheet applications in SAS/FSP™
- graph planning schedules produced in SAS/OR™
- display data accessed with SAS/IMS-DL/I™

SAS/GRAPH lets you preview your display on one device, then replay it on another without re-analyzing your facts and figures. The new Tektronix 4105 Computer Display Terminal gives you the perfect tool for previewing your display. It's fast, easy to use and reliable. A "joy disk" built into the keyboard of the Tek 4105 allows you to move the cursor easily. You can communicate with the host system without interfering with the display on your screen. A special option lets you position the display at or near your eye level or tilt the display up or down, right or left.



At $3995, the Tek 4105 puts high-quality, color graphics at your fingertips.

When you're ready to print your display, push a button on the Tek 4105 keyboard. Hard copy is quickly produced on the new Tektronix 4695 Color Graphics Copier. You can use roll or sheet paper, or make transparencies. It's your's for just $1595.

In VAX™ environments, SAS/GRAPH and Tektronix communicate via asynchronous ASCII protocol. In IBM environments, the new Tektronix 4970 SNA/SDLC Cluster Controller allows for easy host interfacing of up to four graphics devices.

SAS/GRAPH, the Tektronix 4105 and 4695—high-quality graphics for less than the cost of a new programmer.

To learn more about SAS/GRAPH, call or write SAS Institute Inc., Box 8000, SAS Circle, Cary, NC 27511-8000. Telephone (919) 467-8000. Telex 802505.

For information on the Tek 4105 and 4695, call or write Tektronix, Inc., PO Box 1700, Portland, OR 97208. Telephone (800) 547-1512. In Oregon: (800) 452-1877. Telex 910-467-8708.

SAS saves time.

The long arm of the law

The far-reaching effect of the anti-boycott legislation is shown by the unusual experience of Rep. Stewart McKinney [R-Conn.]. The Commerce Department recently accused McKinney of supplying information to the government of Kuwait in violation of the EAA. The anti-boycott portion of that act prohibits U.S. citizens from aiding the Arab boycott of businesses linked to Israel. Specifically, it bars any communication about the boycott.

McKinney wrote a letter on behalf of Connecticut-based Perkin-Elmer Corp., which had sought his aid in trying to clear up a problem of miscommunication. Perkin-Elmer, apparently, was losing Kuwaiti business because a subsidiary had the same name as a different company in Greece that had ties to Israel.

McKinney claims a Commerce official approved his letter.

Warning: A lot depends on the custom agent who examines the imported goods. It is not unusual for one agent to levy a duty based on one valuation and another agent to levy another duty.

Example: Via mail, you exported two identical software packages to Australia. The first package is taxed at the value of the software (for example, 200 copies at $200), while the second is taxed at the value of the diskette (200 copies at $4).

Most exporters will find it advisable to hire a customs broker. For a fee, the broker will handle the paperwork and make any other arrangements for custom clearances.

Warning: To avoid financial surprises, require any foreign licensee to bear the cost of any import duties as well as local taxes. (Be warned that some countries state such obligation clauses unenforceable.)

Other considerations

Many countries restrict exportation of profits. These restrictions generally fall into two main types: currency control and restrictions on technology license.

Earning a large royalty income does no good if you cannot remove the income from the country. What good is earning 10,000 Polish zlotys if you cannot exchange the money for another currency and you cannot export the zlotys out of Poland?

Many countries (including Western ones such as France, Italy and Japan) have at one time or another imposed currency controls. Give some consideration as to what you will do if the foreign country restricts your rights to export profits. Is there some other purpose to which you can put the income (perhaps use the money to buy local goods to import into the U.S.)?

You may also find that there are dual levels of exchange ("official" and the "free market") or that the government requires advance notice to export the money.

Restrictions on technological licensing: Most countries either restrict the amount of technology royalty payments (5% — 10% maximum) or require the royalty arrangement to be registered with the government (Spain and Portugal, for example).

Failure to register means no royalty income can be exported.

You can get around these requirements by either requiring payment in full before shipment or requiring royalty payment be by an irrevocable letter of credit issued through an American bank.

Price Waterhouse & Co. and Ernst & Whinney, both large accounting firms, publish annual surveys of foreign exchange information.

Devaluation, revaluation

Protect yourself contractually against currency devaluation (instead of U.S. $2 = £1.00, U.S. $1 = £1.00) or revaluation (instead of U.S. $2 = £1.00, U.S. $4 = £1.00). Failure to do so can cause havoc when the change in valuation occurs.

Example: On Dec. 1, 1983, U.S. $2 = £1.00. You agree to accept a royalty payment of £10 per copy (U.S. $20). Six months later, Britain devaluates its currency and U.S. $1 = £1.00. Your royalty payment is now equal to U.S. $10.

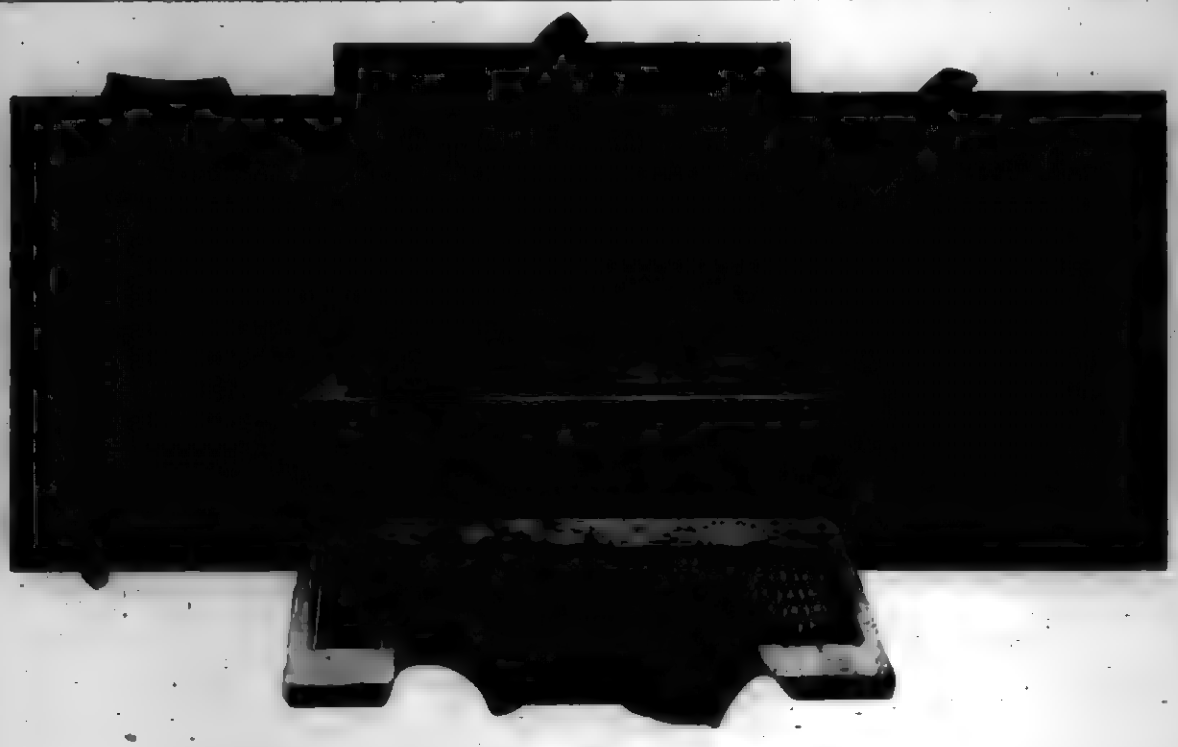
You can get around this problem by making adjustments in the royalty in the event of a change in valuation or by stating the royalty shall be paid in a stable currency (for example, the U.S. dollar or Swiss franc).

Setting up distributorship

Many countries, especially in South America, have enacted contract termination statutes that unilaterally penalize a foreign principal/licenser from terminating the business relationship without incurring a severe penalty. They assume the local agent has a proprietary interest in the local market it developed and the good will it established in the product.

Unless the relationship is terminated for good cause, the agent is entitled to monetary compensation for his interest. The general characteristics of these laws are as follows:

1. Restrict termination for anything but "just cause." Some statutes define what "just cause" consists of.
2. Prohibit any contract language from waiving the compensation and other rights granted the agent by statute.
3. Prohibit the contract from stating which country's law shall apply.



SALVO Shatters
The Information Barrier!

At last. Create your own applications in a fraction of the time compared to BASIC, COBOL or *any* data base language. You know exactly what you want. Now, let your personal computer generate that information by using SALVO, the fourth generation information manager from Software Automation, Inc. It's Better. Faster. And Easier to use.

Natural Language Interpreter. Unique to SALVO, this allows you to enter the following type command, "List my customers and their orders." Watch as SALVO generates the application. *It truly shatters the information barrier.* In minutes you get what you want, the way you want it. Inventory, Accounting, Mailing Lists, Sales Reports and more.

Fourth Generation Language. SALVO is a powerful nonprogrammer's language combined with a true relational DBMS. This method increases your productivity 10 to 20 times normal! People in all professions can benefit from SALVO. Regardless of their level of expertise.

Applications Development Package. SALVO is a complete tool for information management. Develop your own applications. Maintain your data base. Retrieve information using natural language. All of these functions can be performed *by nonprogrammers.* SALVO is also a complete application generator for advanced users and professional programmers. SALVO's secret is simple. Technological innovations including artificial intelligence (expert systems, natural language processors) combined with relational data structures.

SALVO runs on most personal computers. Compatible with MS-DOS, PC-DOS and CP/M. SALVO requires only 64K memory. SALVO is available at your local computer store or you may contact us for information on how to get your own personal preview copy.

4. Require that the agent be given sufficient advance notice of termination.

5. Allow the agent to contest the termination by submitting the controversy to arbitration.

6. Allowing the agent to continue the relationship beyond the termination date built into the agreement.

Sources of information

Always know with whom you are dealing. The U.S. Foreign Service maintains a World Trader's Data Report (WTDR). This trade profile, which contains detailed information on individual foreign firms, is available from the U.S. Department of Commerce, Office of Export Marketing Assistance, Room 1033, Washington, D.C. 20230. You must provide the firm's complete name and address (preferably on Form ITA-431, obtainable from the above address). There is a charge of $75 for each WTDR ordered.

Typical information includes type of organization, number of employees, method of operation, general reputation in trade and financial circles and names of the firm's trading connections.

The Office of Trade Information Services (Otis) publishes lists on selected countries and industries for the purpose of assisting U.S. exporters.

The lists contain the names, addresses and other business information about foreign trade agents, distributors, manufacturers, retailers and so on. Lists include telecommunications equipment, electronic components and computers and peripherals. Current information and prices for each list may be obtained from the U.S. Department of Commerce, Office of Trade Information Services, P.O. Box 14207, Washington, D.C. 20044.

Many foreign countries (for example, Japan, Mexico, Portugal and Spain) require the registration and approval of licensing agreements. Some countries can require changes in the substance of the agreement.

Unless a double taxation treaty eliminates the requirement, all countries will require a local licensee to withhold tax on any royalty payment made to a noncitizen. This tax can be as high as 50%. You also owe U.S. income tax on the royalty. With a double taxation treaty, you are allowed to take a credit on your American taxes in the amount of the foreign taxes paid, thus avoiding double taxation. Do not be surprised if a large percentage is withheld by the licensee as payment on local taxes. If your licensee does withhold taxes, get contractual requirements that it provide evidence that it paid the tax.

Protection of ideas

American patents and trademarks have no legality outside of the U.S.

Example: The European Patent Convention, Article 52.2.c, specifically excludes "schemes, rules and methods for performing mental acts . . . and programs for computers" from patentability.

The problem is even more confusing with trademarks. The U.S. is a party to a number of trademark treaties. Under them, an American trademark owner has a set length of time (usually one year or less) to secure priority of the trademark in a foreign country.

Failure to register and secure your right within the priority period means the first person to apply and secure registration becomes the lawful owner.

Warning: In some countries (for example, France), the first applicant is entitled to register and protect the mark. If you later decide to market your program in that market, you will find yourself being "blackmailed" to doing business on the owner's terms or picking a new trademark for that market.

Copyright protection

The U.S. has ratified the 1952 and 1971 Universal Copyright Conventions.

Each signatory agrees that it shall give the same protection to works of foreigners as their own citizens provided that since first publication, each copy of the copyrighted material contains the copyright "©" symbol along with the name of the copyright owner and the year of first publication.

Warning: Notwithstanding the Universal Copyright Convention, each country can determine what is copyrightable. Recent court decisions have upheld software copyrightability in the Federal Republic of Germany, while denying it in Australia.

As of 1982, only Bulgaria explicitly stated computer programs were copyrightable. In the rest of the world, the question is still open.

Always clearly state the life of the agreement (between one and five years is reasonable), under what circumstances it can be terminated early (for example, by bankruptcy of the licensee) and the rights of each party at agreement's end.

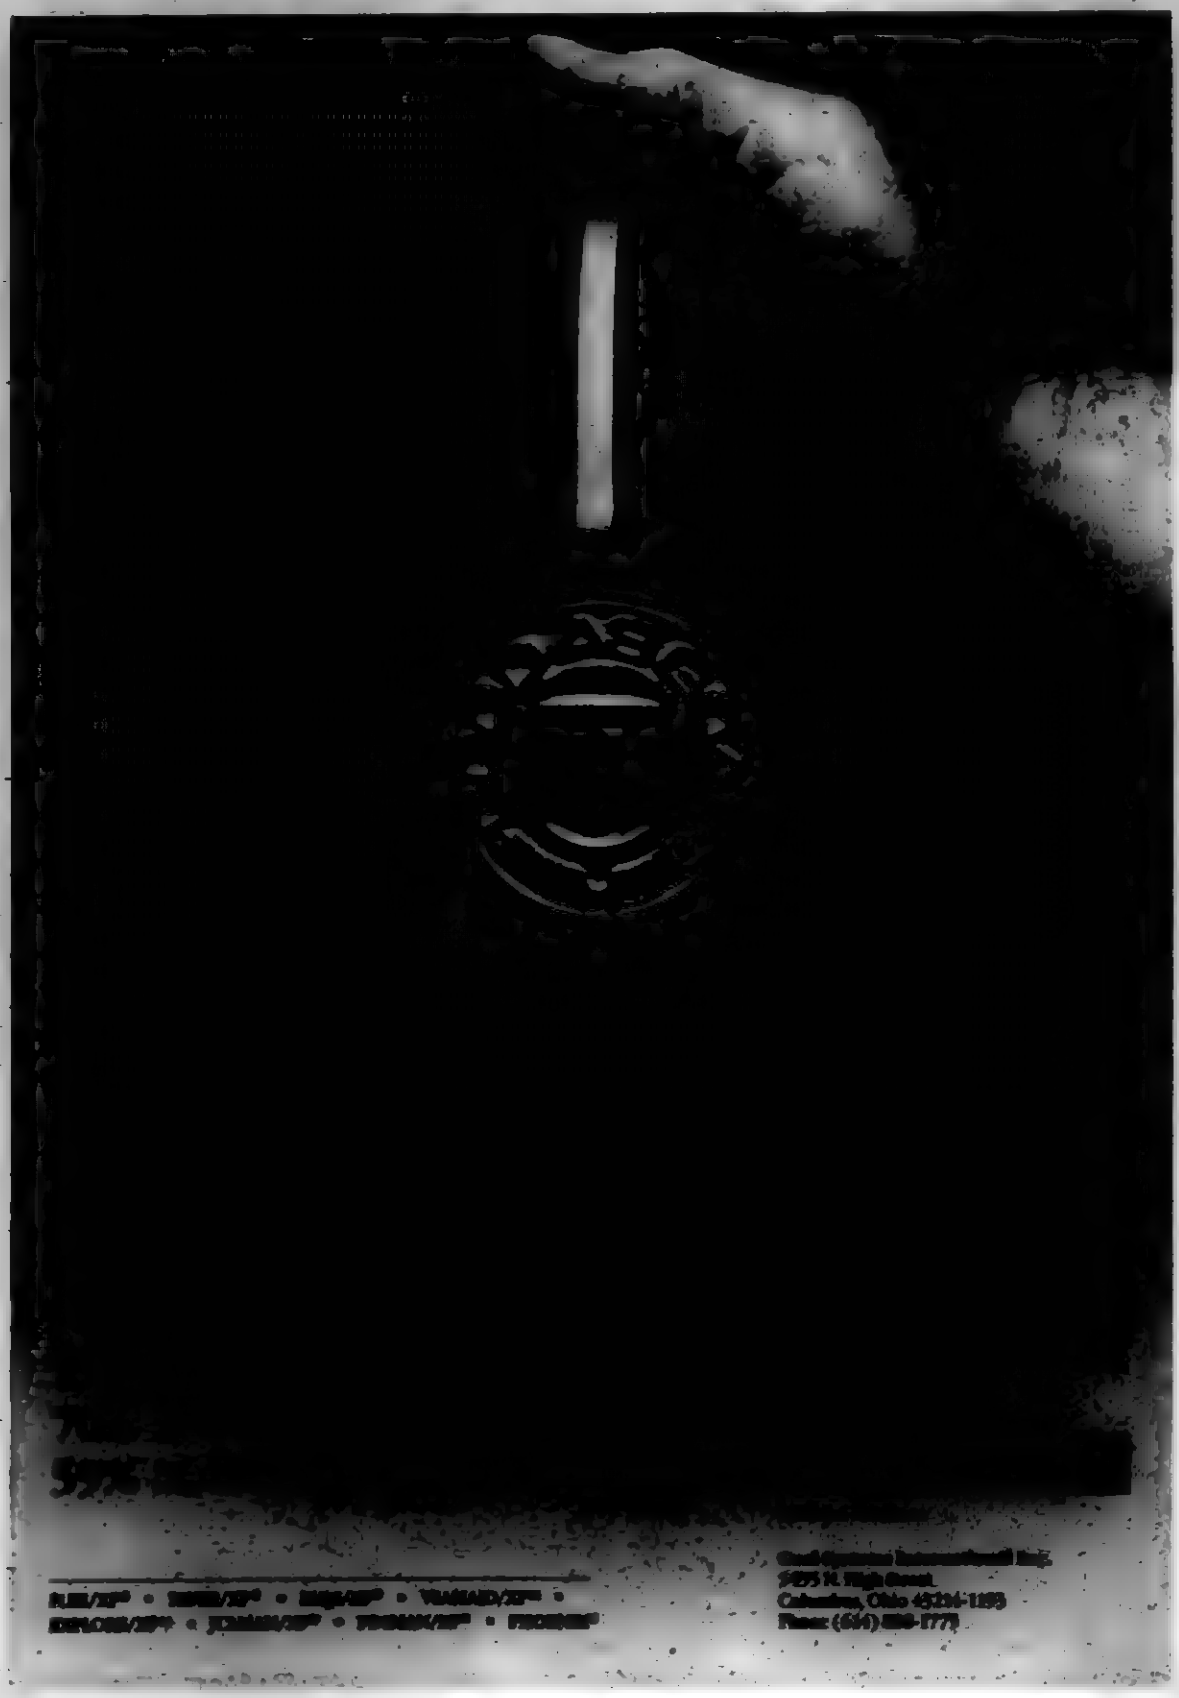
Finally, when dealing with a non-English speaking country, provide that the English version of the contract will control over the non-English version.

About the author

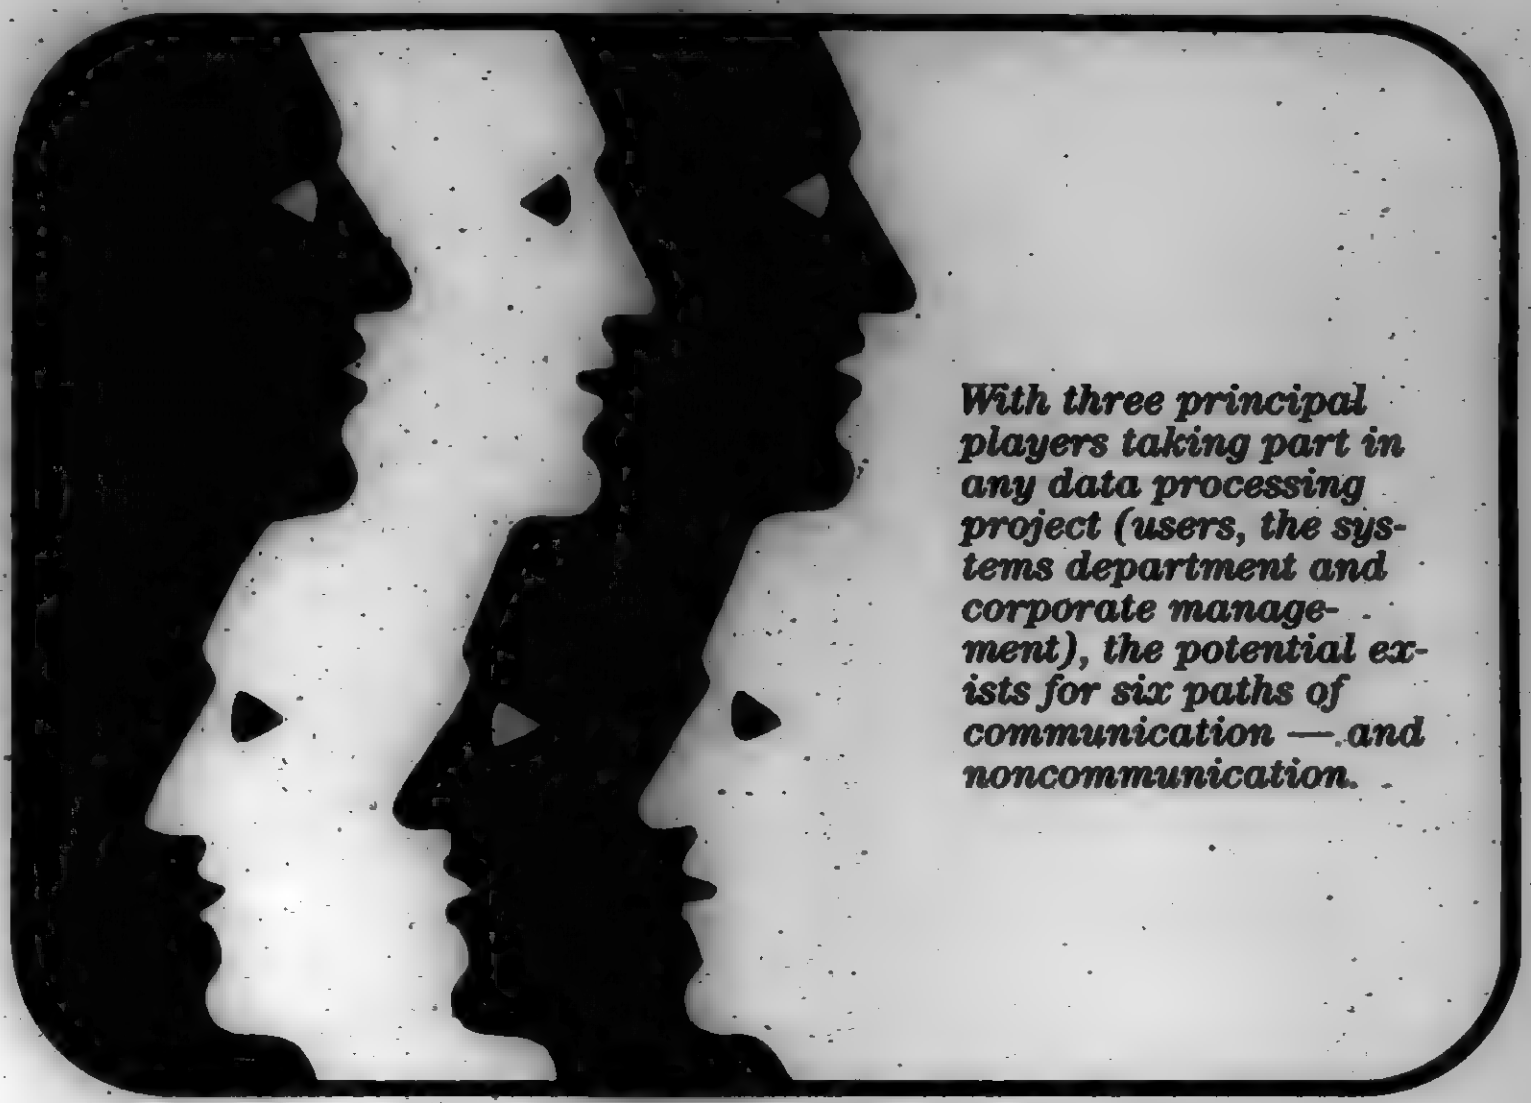
L.J. Kutten, an attorney living in La Jolla, Calif., is a member of the Missouri and Illinois bars.

A specialist in nonpatent computer law, he wrote Computer Buyer's Protection Guide, *published by Prentice-Hall, Inc.*

Kutten is currently working on a book called The Law and Software, *to be published by Prentice-Hall next fall. The book will also cover the subject of software exports.*



IN DEPTH



With three principal players taking part in any data processing project (users, the systems department and corporate management), the potential exists for six paths of communication — and noncommunication.

Static communication

By Michael Martin

The breakdown in communication during any data processing project can be traced to one or more of the three principal players: users who are asking for a particular system or service to be delivered; the systems department (either internal or external) that is charged with providing this new system or service; and the company management group that guides and approves the development/implementation of the system or service.

Between any of the three players — user, systems department and management — there are six possible directional paths for communication. Often, some of these communication paths do not exist at all; some that do exist are inadequate.

Progress toward reducing the communication problem has not kept pace with the dramatic improvements in data processing technology. The problems encountered in the mid-1960s were excused with such justifications as:

"Well, it's a new technology."

"There aren't many people out there, especially on the users' side, who understand what makes this all go."

"The vocabulary isn't intended for non-DP professionals."

Yesterday's problems today

Over time, some of the vocabulary and technology have become more comprehensible by more users — consider the proliferation of the buzzword "user-friendly," for instance. But the problems in communication have not gone away. There are still large numbers of projects that fall far short of original expectations, are seriously delayed or are abandoned altogether because of bad communication.

Sound transmitted over a long distance loses the quality and strength of its signal. The same is true of the communication process. If you go too long without reinforcing the signal, the message becomes misunderstood and eventually lost.

In a successful communication, the sender and the receiver frequently reverse roles, a bidirectional process. One classic, recurring problem between users and DPers is that one party tends to

DP projects often fall short of expectations or are delayed and even abandoned because of miscommunication or noncommunication. To clear up such problems, any organization can develop a long-range DP plan, create a corporate systems steering committee and proactively educate users, DP and management.

dictate to rather than communicate with the other.

In the systems development process, the use of formal methodologies often goes a long way in correcting some of the problems associated with the communication process. The most successful systems development methodologies share a number of common characteristics: They prescribe an iterative approach; they involve representatives from all participating groups and define their roles; they build on intermediate products and decisions; they establish standards for documentation; and they strongly encourage project management. In short, they all facilitate communication.

A word of caution: If a methodology is not understood or followed, the project may fail. One company adopted a nationally known systems development methodology that the users did not understand but the DP people believed they did. During development, the DP department prepared massive amounts of highly technical documentation based on the methodology. The documentation was presented to the users for review and correction and ultimately for approval.

Without user approval, the DP department could not proceed with the development according to the methodology, and the users would not get their system. Thus, the users were confronted with an interesting dilemma: approve something they could not understand and take a chance the outcome would be satisfactory (a 50% chance of failure) or not approve the documentation and stop the project (a certain failure).

One can imagine the decision they made and the eventual results. The DP department played by the rules, obtained user sign-offs and proceeded. Later, the department was surprised and angry when the delivered product was judged inadequate.

Each systems development methodology step refines the products of prior steps until the user ends up with the desired working system. It is crucial to the eventual success of the project that the steps in the systems development methodology produce tangible products, such as formal documentation. While written documentation is not foolproof, it has a better chance of limiting miscommunication than does verbal communication.

What we are talking about here is not only applicable to DP but to any group that must communicate with another group within an organization. In a manufacturing environment, for instance, there is the complaint that the sales force is out selling things that have not yet been designed and priced.

Commitments relative to size, style and delivery dates are made, but manufacturing is not taken into account until it is too late. Often, antagonism develops between the departments, which can result in a dissatisfied customer and a lost sale.

Drawbacks to process

There are drawbacks to the documentation process. Earlier, the example of the documentation that was too technical in nature to be understood by the users was noted. Another documentation problem occurs when the documentation is written by a select few. If the users produce it all, problems will arise with the DP people; if the DP people produce it all, the users will have significant problems in utilizing what has been created.

Another impediment to communication is the "language barrier." For years it has been taken for granted that each area within an organization has its own vocabulary and buzzwords. DP is no exception. Often the use of such specialized terminology finds its way into the documentation process. Using a systems development process with a number of product-oriented steps, those having to sign off on documentation have more

HOW CAN ANYONE BE PRODUCTIVE FOR EIGHT HOURS IF THEY LOOK LIKE THIS AFTER FOUR?

For most people, computers have become a way of life. Unfortunately, if the computer is poorly designed, it can mean a life of bleary eyes, stiff backs, and headaches.

At Burroughs, we've been doing something about these problems—by continuing to study the effects computers have on the people who use them. This is referred to as the science of ergonomics.

And out of this science we've developed a full line of ergonomic terminals and workstations, including the Burroughs ET1000 and 2000.

We found, for example, that small computer screens with poor lighting often cause strained eyes and throbbing heads. So we designed a large, adjustable, 14-inch non-glare screen with high character resolution for sharp, precise images that are easy to read.

We found that it's a lot easier for people to tilt a keyboard than it is to tilt their backs. That's why our ET series comes with a low profile, detachable keyboard that adjusts to three different heights.

We've even gone so far as to make an adjustment for something as small (but annoying) as a key click.

Of course, this sort of attention to detail is exactly why Burroughs continues to remain a leader in the computer industry.

You see, the real measure of a computer company isn't only how well their computers work. But how well a person works with their computer.

For details call 1-800-621-2020.

opportunities to identify potential problems and ask for clarifications.

This type of communication reinforcement can be termed "creeping commitment." Here, a project team goes along and commits to what has been developed and documented to date. The project then goes a little further along, and a new commitment is made; it goes a little further and is approved again by the team. In this way, everyone involved knows exactly where the project stands and what is to be accomplished next.

The outcome at the end of this process should not be a surprise for anyone because he has participated in every logical component as it developed.

ABC and OEM

To punctuate the horrors that could arise from developing a product by this latter method, an example is appropriate. A certain company (ABC, Inc.) wished to have a computer system installed that would provide users and management with necessary data to improve its business operations. It contracted with an OEM firm (OEM, Inc.) to provide the computer system. ABC decided to show OEM a computer system that operated the way it wanted its system to operate and took OEM to visit a company that had such a system.

This system, according to ABC, would meet its needs. The comment by ABC to OEM was, "We want a system like that." ABC management then took OEM personnel around its own facility, notes were taken, and OEM went away to develop the desired computer system.

Several months later, OEM delivered a computer system that ABC would not accept. ABC's comment was: "That's not what we wanted." OEM's reply: "But that's what you showed us." After some lengthy negotiations, OEM reconfigured the system. Again, ABC management was not totally satisfied with the final product. Since OEM felt it had gone above and beyond its obligations, it termed the contract "fulfilled."

The outcome was an inefficient end product just sitting around on ABC's premises, a waste of effort on OEM's part, a waste of money on ABC's part and lawsuits for claims and damages initiated by both sides.

Clearing up communication

There are three significant steps that any organization can take to clear up its existing and potential communication problems involving DP. The first is the development of an overall, long-range DP plan. Once developed, the plan needs to be distributed widely in the organization so that people will know what will happen, in what sequence and in what time frame. These plans need to be maintained continuously and regularly.

Along with the creation of the plan, an organization needs to have some type of corporate systems steering committee composed of the heads of the key user departments, the data processing group and senior organization managers. The committee is charged with the responsibility for a number of issues, such as establishing priorities, approving major expenditures, setting key policies and approving the allocation of resources. The committee should meet frequently and report its activities to the organization. When an important project is initiated, the work plan should include key output and decision points for committee review.

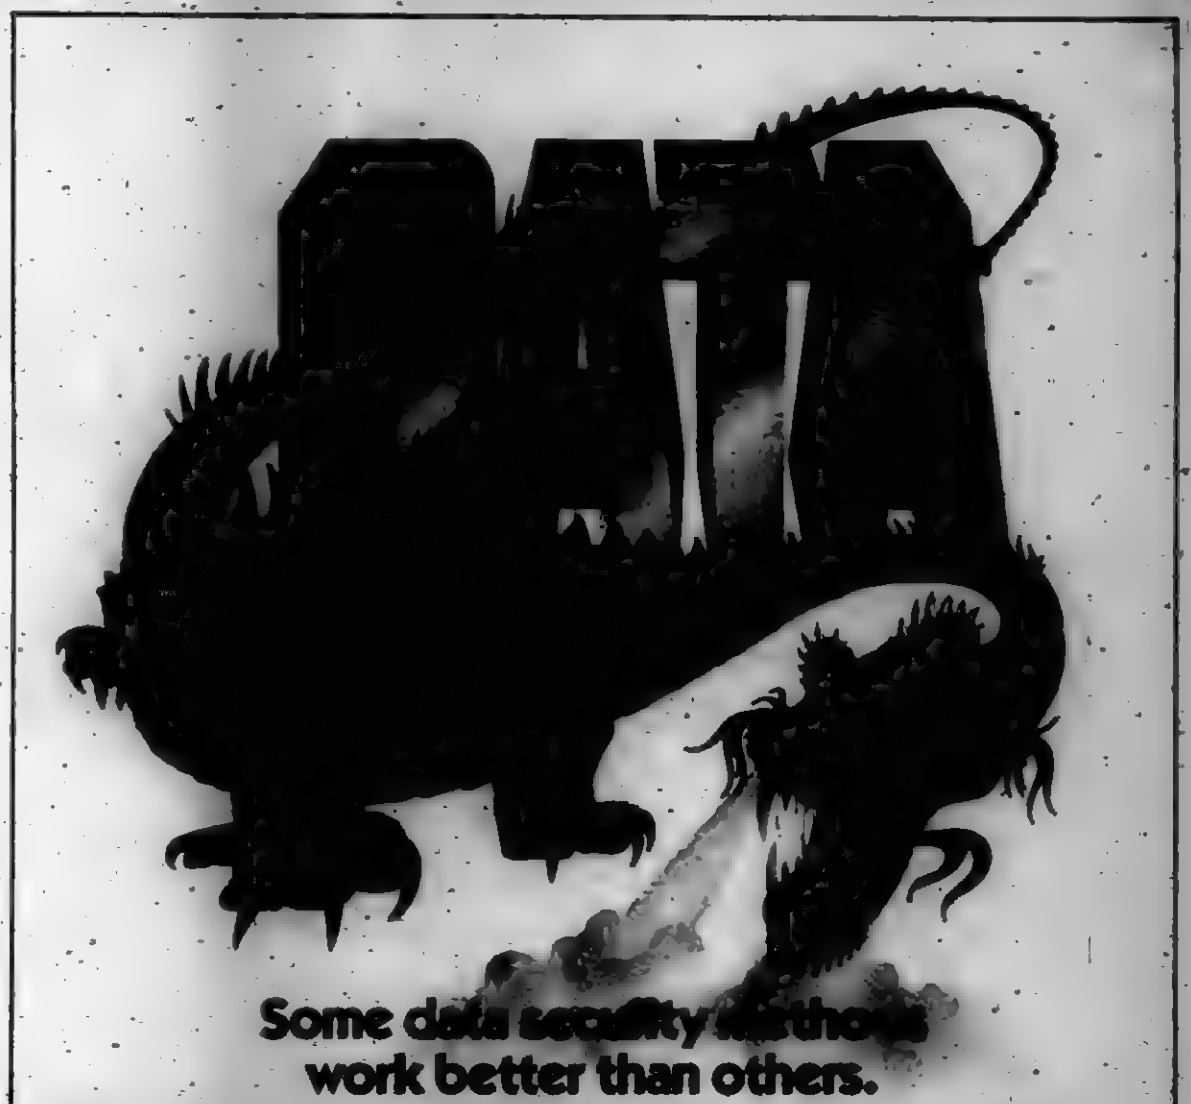
Several months later, OEM delivered a computer system that ABC would not accept. ABC's comment was: "That's not what we wanted." OEM's reply: "But that's what you showed us." After some lengthy negotiations, OEM reconfigured the system. Again, ABC management was not totally satisfied with the final product. Since OEM felt it had gone above and beyond its obligations, it termed its contract with ABC "fulfilled."

Recently, one major corporation added a new wrinkle to the committee system and has been quite successful in its approach. When a major new project is started, especially one that crosses several organizational lines, the project manager is selected by the steering group. In turn, the project manager reports back to the steering committee on a regular basis.

Since everyone on the steering committee represents a user area within the corporation, no user is ever surprised when changes are introduced or modifications made to the developing system.

The final major factor in clearing up communication problems is through a proactive type of educational process directed at users, DPers and management, primarily the first two.

Too often, there is a divergence in the underlying objectives between users and DPers. On the one hand, the users are trying very hard to get something that will help them perform better. Their instincts tell them to get the best possible product in a reasonable time frame.



TOP SECRET the state-of-the-art resource protection package for MVS works best of all.

TOP SECRET is data security at its best. Offering quick installation, phased implementation and comprehensive resource protection, TOP SECRET outdistances all other data security methods for total resource protection.

TOP SECRET immediately secures your most critical resources without impacting normal processing. Implement security with no delay and with absolutely no modifications to your operating system.

TOP SECRET is the only total resource protection package that offers comprehensive CICS security, including file and program control and protection down to the field level.

By using the Standard MVS Security Interface, TOP SECRET becomes an integral part of your operating system. Complete compatibility with all IBM and vendor products that use Standard Security is automatic and guaranteed, now and in the future.

TOP SECRET security comes with the same top-notch technical support that guarantees the quality and reliability of all CGA software products.

Protect your valuable data resources today. Join the MVS sites across the country that have considered every data security method and made the sure TOP SECRET choice.

Call for additional product information and your free trial.

Given their preferred sequence, users are looking for product quality first and timing second.

DP, on the other hand, seems to have an almost infinite backlog of requests for work. While the department is not uninterested in quality, its instinct is to produce the best product possible within the time constraint placed upon it.

Therein lies the rub. Every time DP goes and talks to users, it is presented with a problem or a change or new demands. From the DPer's perspective, agreeing to the users' requests can create more work and upset the project's time schedule.

Of course, the user is merely making the system more useful and accurate. Given that the objectives of the two groups seem to be in conflict here, DP may avoid talking to users unless it is absolutely necessary.

Therein lies the rub. Every time someone from the data processing department goes and talks to users, he is presented with a problem or a change or new demands. From the DPer's perspective, agreeing to the users' requests can create more work and upset the project's time schedule. Of course, the user is merely making the system more useful and accurate. Given that the objectives of the two groups seem to be in conflict here, DP may avoid talking to users unless it is absolutely necessary.

An effective educational process will reinforce DP's role as a service function within the organization. Without users, the department has no reason to exist. It must learn more about the "business" of the business. And above all, it must improve its "people" skills, such as listening.

For their part, users must be made to understand what systems development is all about since most users tend to find the cycle confusing or incomprehensible. They should know more about the methodology and terminology used in the development process since they will increasingly play key roles during development. Finally, users must understand the consequences their demands place on DPers.

Users should come to realize that every modification to a developing system can affect the entire project. A knowledge of the consequences of a change permits a realistic appraisal of its value based on budget and calendar consequences.

Educating management

The management group also must be educated so that it understands exactly what is expected of it. Information is a corporate asset. Managers should control this asset as they would any other that affects the fortunes or failures of the corporation. In the hands of the wrong people or misused, information could inhibit the corporation's ability to be competitive and prosper. In the hands of the right people, this very same commodity could give the corporation the competitive edge it needs to excel.

It then becomes necessary to educate the management group. Management must be shown that its role is not one of a passive bystander in the process of systems development; its function is not merely to sign checks as the development process takes place. Rather, the prioritization process and approval process is a function that management must be made to understand and exercise.

Too often, management either abdicates its responsibilities to the users (the end product is intended for them) or to the DP department (which possesses the technical expertise). This attitude can only be changed through a strong education process.

Above all, education must be constantly reinforced. New players come in; old members are reassigned, promoted or retire; technology changes.

Solutions not spontaneous

Although communication problems and horror stories abound, organizations do not have to settle for that kind of an outcome. It is not preordained that the communication problems outlined above await every new systems development project. The organizations that tend to be the best at resolving communication problems work at the problem constantly — the solutions are rarely spontaneous.

Such organizations recognize that a problem exists and go after it. They set into motion a proper organizational plan and education process, institute a proven methodology, appoint appropriate steering committees and bring on board people who understand that they cannot be passive in the communication process.

When all of these factors are blended together, the problems of systems development and communication may not go away entirely, but they can be controlled.

HARD TALK
Tom Henkel
CW Senior Editor

IBM tars dead-end road with X line

By replacing its 3080 series of mainframes with newer X models, IBM has steered current users of 3080 series processors onto a dead-end street. The older 3080 series processors are not field-upgradable to the newer line of processors because the X models incorporate different design and circuit packaging technologies.

The only way users of the older 3080 systems can upgrade to the newer models is to buy a whole new processor. While 3080 series users still have the option of upgrading to larger, older machines, IBM's move appears to be a reversal of the marketing tactic developed with the first of the 3080 series processors back in 1981.

When the first member of the 3080 series, the 3081 Model K, was announced, IBM appeared intent on offering a line of processors that were field-upgradable to larger models. At the time, many speculated IBM mainframe users would never have to buy additional new processors. They would simply add boards or other components to build bigger systems.

For a while, this building block architecture theory held true. When the 3083 was announced, it was field-upgradable to the 3081, and the 3081 was field-upgradable to the top-of-the-line 3084.

Now the building block architecture theory has come crashing to the ground. For owners of the old class of 3080 series processors, the end of the migration path is clearly in view. Granted, IBM cut the price on model-to-model upgrades for users of the older 3080 series processors, but is a 7% to 10% price break an adequate pacifier for being cast out of the mainstream of IBM's current big systems lineup?

Westinghouse awards grant to accelerate optical DP

By James Connolly
CW Staff

PITTSBURGH — Hoping to help raise the technology from its "infancy," Westinghouse Electric Corp. has awarded Carnegie-Mellon University a $1 million grant to establish an optical data processing center here.

"Optical processing is in its infancy, but we felt we could help to accelerate the program," said Dr. John Hulm, acting general manager of the Westinghouse Research and Development Center.

The three-year grant, approximately two-thirds of which will be used for operating expenses and one-third for equipment, is intended to spur research into various types of light-based processing.

Photons replacing electrons

"We are going to try to use photons rather than electrons. I think there is potential for doing a great deal with photons," Hulm reported.

Hulm said optical data processing could be an element in or an offshoot to the U.S. government's *Star Wars* space defense program. He noted that systems such as sophisticated radar units, laser equipment and robots could utilize the high-speed processing that may be available through optical data processing. He said that optical processing could facilitate faster array, analog and parallel processors. He added those machines might work on the same principles as the human eye or brain.

However, he added, "I think it will take at least a decade to get this sort of thing going." He said a breakthrough could be digital processing at an optical level or development of optical amplifiers and optical transistors.

He reported that some current spectrum analysis equipment uses technology that borders on optical data processing, but that there may never be true optical data processing.

"What we are beginning to look at is the possibility of optical chip sets, which combine micro circuits with optical processors. We may end up using a lot of hybrid devices," he said.

The value of optical processing, according to Hulm, rests in the ability to construct complex yet small processors that, unlike current circuits, generate little heat.

Under the grant, which can be extended by the company beyond three years, Westinghouse is paying to modernize and expand laboratories at the university and will provide equipment to the school.

The optical data processing center will be headed by Dr. David Casasent, George Westinghouse professor of electrical and computer engineering at Carnegie-Mellon.

Hulm reported that Westinghouse wanted to support the local university, spur technological developments and build a pool of optical processing researchers who may be available for future employment at Westinghouse.

Firm speeds operations with printer

NEW YORK — A laser printer is helping a commodities trading firm here remain competitive.

The New York office of Gill & Duffus is heavily involved in commodities trading, a business that hinges on timely information, which in turn calls for a fast, accurate way to perform accounting and billing functions.

Each day after the market closes, a five-person information systems staff is responsible for documenting trades, updating accounts, preparing contracts and invoicing customers. The staff also handles month-end closing and DP for several Gill & Duffus companies. The firm was leasing an IBM System/36 for accounting and some "back-office" functions.

A decision was made to automate many of the back-office operations associated with trading in May 1983. William

Two graphics boards debut for 3270-PC users

RYE BROOK, N.Y. — IBM last week announced two optional business graphics boards which allow users of the firm's 3270 Personal Computer to create bar charts and pie charts using both microcomputer and mainframe data.

Announced last October, the 3270-PC gives users local microprocessing capabilities plus the ability to run programs simultaneously on an attached IBM mainframe processor operating under the VM/CMS operating system. One of the main features of the 3270-PC is a multiple windowing capability that allows users to run host and microcomputer applications concurrently and to share mainframe data with microcomputer applications.

The graphics capabilities announced last week consist of two circuit boards. One is located in a mainframe processor, the other is located in the 3270-PC.

Host interactive board

The Host Interactive Business Graphics board attaches to any IBM mainframe capable of running 370-era systems software. The unit allows users of 3270-PC Models 2, 4 and 6 to create eight-color graphics from host-generated data. To make use of the feature, the 3270-PC must be in a distributed-function terminal mode, and the host processor must be using IBM's Graphical Data Display Manager program product, according to IBM.

While the 3270-PC allows users to run up to four concurrent host programs, only one of those programs can be a graphics session. Further, a programmed symbols adapter card installed in the 3270-PC provides storage for up to six user-definable symbol sets. Each symbol set can contain up to 190 symbols, IBM said.

The Host Interactive Business Graphics Board costs $800 and will be available in the second quarter. First customer shipments of the 3270-PC began in February, IBM said.

The second graphics board, called PC Graphics Adapter, fits inside Models [illegible], 4 or 6 of the 3270-PC. The board allows the user to generate graphics for sessions running only under IBM's PC-DOS Release 2.0 or 2.1 operating system and provides four-color graphics with a resolution of 360 by 350 or 320 by 200 pixels. In addition, the board allows users to generate two-color high-resolution graphics at 720 by 350 or 640 by 200 pixels, IBM said.

The PC Graphics Adapter costs $550 and will be available in the second quarter.

The purchase price for a 3270-PC Model 4 with both the host and graphics boards is $6,029. The configuration includes a processor, color display, host (programmed signals) graphics adapter, a PC Graphics Adapter, printer adapter, 3270-PC control program and IBM's PC-DOS Release 2.1 operating system.

The enhancements were announced by IBM's Information Systems Group, located at 900 King St., Rye Brook, N.Y. 10573.

SYSTEMS & PERIPHERALS

TURNKEY SYSTEMS

REDWOOD SOFTWARE SERVICES
Universal Life

Redwood Software Services has developed a turnkey system based on the IBM Personal Computer for insurance agents.

Called the Universal Life system, the unit offers a standard 80M bytes of random-access memory, which can be expanded to more than 210M bytes. Software includes business, administration, reinsurance and proposal packages, the vendor said.

The business portion of the package provides current underwriting information plus predetermined underwriting requirements on command. Other features include: underwriting worksheets, a daily pending new business report with outstanding requirements, average-size policy, average premiums and average issues times.

The administration system handles multiple funds, annual statements on request as well as on the anniversary, on-line inquiry, premium notices, on-line policy maintenance and automatic error correction features.

The 80M-byte capacity of the initial unit can handle up to 800 paid new policies/mo plus 13,000 current policies. Hardware supplied is an IBM Personal Computer with IBM's PC-DOS 2.0 operating system, a printer and peripheral storage.

The complete Universal Life system, including hardware and software, costs $67,500.

Redwood Software Services, 48 Barbaree Way, Tiburon, Calif. 94920.

BUSINESS SYSTEMS DEVELOPMENT CORP.
Distribution Computer System

Business Systems Development Corp. has announced a turnkey system designed for use by automotive, hardware, electrical, construction, grocery and other product distribution networks.

The Distributor Computer System reportedly allows a user to prepare quotes for customers; develop orders and print invoices; track and manage inventory; computerize accounting; tie into electronic mail services; help fill orders; and perform word processing functions.

According to the company, the key to the system is the request for quote file, which enables account executives to prepare a quote tailored to the customer, drawing upon the cost of a part, discounts and markups, inventory and recent quotes to customers.

The system, available now, is said to be based on Convergent Technologies, Inc. AWS and IWS minicomputers and Burroughs Corp. B30 minicomputers. Prices range from $5,000 to $30,000.

Business Systems Development, 45 Davids Drive, Hauppauge, N.Y. 11788.

Are Hostile Communication Circuits
GOBBLING UP YOUR DATA?

Costing you time and money?

If you've tried to transmit or receive data over non-dedicated, voice-grade communication lines, you're familiar with missing and incorrect data. Time lapses. Repetitive retransmission. And the interminable "WAIT" while typical error detection protocol tries unsuccessfully to insure error-free data. But maybe you're not familiar with what causes these problems. Everything from phone company and secondary carrier service routing to crosstalk and impulse noise. Basically problems beyond your control.

Compsec's 9600C can't prevent the problems, but it can automatically transmit your data at the optimum rate and level to overcome whatever gremlins are lurking in your communication lines. Call Compsec today.

And stop playing video games with your important data.

COMPSEC, INC.
10000 Cle Katy Rd., #275
Houston, TX 77055

Telex: 910-881-4573

IBM from page 71

For 3083 users, noted Charles Greco, an IBM watcher with the Framingham, Mass.-based International Data Group, the future is not so dismal because there are several possible system upgrades that can be made before reaching the end of the road. But for users of the 3081 line, the migration path is very limited. Greco noted there is a maximum of two system upgrades possible for 3081 users.

And what happens to the residual value of the older 3080 series processors? Greco theorized that the X models may be field-upgradable to IBM's Sierra or Trout series of larger processors, expected to be announced later this year. Since the X model processors do everything the older models can do, plus offer more performance for the same price, who will want the older models? Chances are, current users will wind up trading them among themselves.

The irony of IBM's announcement of the X models is the timing. While the 3080 line was kicked off with the 3081 Model D in 1981, most users did not receive 3080 series processors until about a year ago. Now the line is obsolete. IBM used to give users at least five years before announcing successors to its processors. Now users appear lucky if they get a year's worth of use out of their machines.

PRINTER from page 71

Mischler, Gill & Duffus' manager of information services, designed a strategy to reduce the manual steps required to document trades, invoices and update accounts. For example, with terminals on the trading floor, a trader can enter transaction details as easily as reporting to a secretary, and the DP system will automatically complete the job.

The back-office operations needed an electronic printer capable of producing complex forms while simultaneously filling in forms with details on transactions. The printer's graphics capabilities would have to solve other problems faced by the DP department, such as maintaining up-to-date form design, he said.

Also, "designing, storing and changing forms had become a costly headache," Mischler said. "Our business requires small quantities of a variety of forms. Each afternoon, the DP staff was delayed by at least eight different forms changes."

Since contact with customers is by telephone and correspondence, Gill & Duffus places high priority on professional-looking documents, Mischler said. Letter-quality output with high dot density was a prime consideration for his electronic printer selection. Other requirements included high speed, quiet operation, use of plain paper and graphics capabilities. To reduce hardware costs, the intelligent printer would have to operate as four different devices — system line printer, word processing quality printer, a graphics device and plotter and a forms generator.

After investigating a variety of vendors, including IBM and General Business Technologies, Inc., Mischler chose Quality Micro Systems, Inc. (QMS) Lasergrafix 1200 intelligent laser printer based on his prior experience with a QMS controller board-enhanced Printronix dot matrix printer.

Installed in October 1983, the Model 1200 uses a Xerox Corp. print engine and is maintained by the Xerox service network. The device prints up to 12 copy/min with a resolution of 90,000 dot/in. and is capable of bit mapping 8½- by 11-in. or 14-in. paper. Built-in firmware enables the Lasergrafix 1200 to produce complex graphics with simple user commands and requires no CPU memory. It is connected on-line and sits in the computer room with the System/38, which Gill & Duffus decided to purchase.

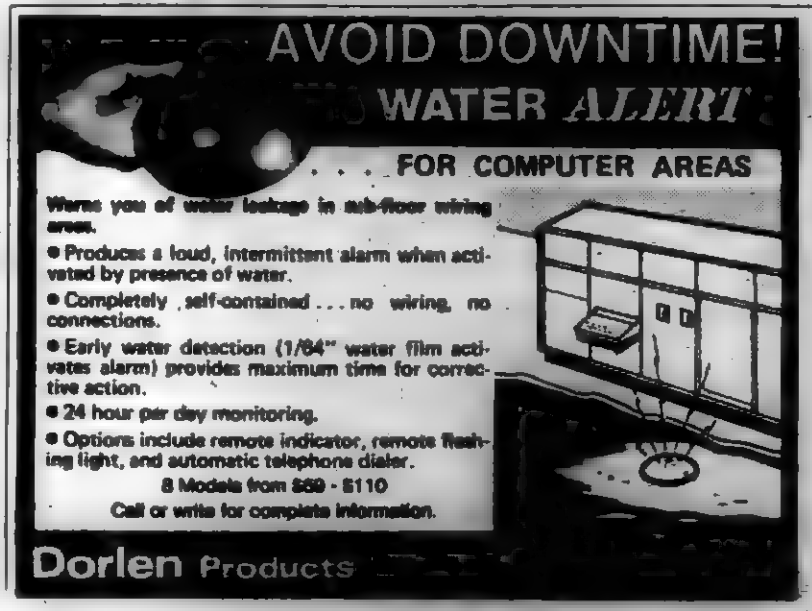
The decision to purchase came after a five-year amortization revealing that the company could save a "significant amount" of money by purchasing rather than leasing the system. In turn, the cost savings generated by the purchase helped Mischler get approval for the laser printer.

Also, another three IBM terminals have been added to the original seven attached to the System/38. User departments can now input information at the beginning of a transaction and send it to the printer, which is programmed to take over from there under an IBM spooling package, Mischler said.

"The Lasergrafix 1200 enables us to design our own forms, store them and simultaneously print the form filled in with variable information," Mischler said. It also operates as a system printer without programming changes. "We have eliminated the delays and costs associated with designing, printing and changing forms during each afternoon's documentation process," he added.

While the current use of the printer is producing documentation, Mischler is also using graphics capabilities in producing reports. "Much information we need can be reported more concisely and is more quickly understood when converted to charts and graphs," he explained. "The printer enables our staff to combine charts with text easily and avoid complicated plotting procedures. The printer does all the work."

Aside from other benefits, the laser printer is making another important contribution to the automation strategy, according to the information systems manager. "The printer is so flexible and easy to use, even noncomputer types who resist automation are intrigued by its capabilities," he pointed out.



SYSTEMS & PERIPHERALS

TURNKEY from page 72

SCOTT SYSTEMS, INC.
Pars

Scott Systems, Inc. has introduced Scott Advanced Program Airline Reservation System (Pars).

Pars features magnetic card reader support, multiple screen modes, screen memory, text string facilities, communications trace mode and networking capabilities. Pars includes reservation software, an Intel Corp. 8088 microprocessor and 64K bytes of random-access memory, which can be expanded to 1M byte.

The basic system costs $3,400, and each terminal connected to the system sells for $1,989.

Scott Systems, One Metropolitan Corporate Center, Marlborough, Mass. 01752.

STEP ENGINEERING
Step-27

Step Engineering has announced its Step-27, a development station that includes a disassembler for microprogrammers and design engineers.

The Step-27 reportedly supports bit-sliced and microprogrammed designs and provides Step Engineering's Writable Control Store memory package. It also features the company's Trace Instrumentation and its Disassembly, data-driven software package, according to the company.

It is said to use emitter-coupled-logic 10-nsec random-access memory chips connected to the address and data pods.

Step-27 prices start at $25,000, and it is available now.

Step Engineering, 757 N. Pastoria Ave., Sunnyvale, Cal. 94086.

DATA STORAGE

WINCHESTER SYSTEMS, INC.
Datasafe-24

Winchester Systems, Inc. has introduced Datasafe-24, a 15M-byte, 5¼-in. fixed Winchester disk system

To all supra Price changes on following items effective immediately: No. 10-11A, 10-114A, 10-AL.

Chris: The latest offer looks better, although it's still not what we were hoping for. Try for another compromise.

Just got the word from Gary. Increased our share by 6%. If trend holds, we'll pass competition by third quarter!

Smartcom II communications software, currently available for IBM PC, DEC Rainbow 100, Xerox 820-II and Kaypro II.

Smartmodem 1200 for all computers with an RS-232C interface; Smartmodem 1200B plug-in board for the IBM PC.

Microcomputer communications? Get control of the situation with Hayes.

Microcomputer communications can present the DP/MIS staff with a tangle of mis-matched hardware, user-hostile software, and a situation that can quickly get out of hand.

Hayes can help you avert that chaos, with a telecomputing system designed expressly for microcomputers.

A system so advanced, it's downright simple. Economical. And requires no handholding from you.

Hayes. The computer's telephone. Our Smartmodem 300™ and Smartmodem 1200™ connect to any desktop computer with an RS-232C port. They operate with rotary dial, Touch-Tone® and key-set telephone systems. At full or half duplex. And both feature self-test capabilities, as well as indicator lights and built-in speakers for monitoring calls.

The lower-priced Smartmodem 300 is ideal for local data swaps and communicates at 300 bps. A built-in speed selector on Smartmodem 1200 automatically detects transmission speeds (110, 300 or 1200 bps).

Smartmodem 1200B™ is also available as a plug-in board for IBM® Personal Computers. And Hayes manufactures the Micromodem IIe® for Apple® II, III, IIe and Apple Plus computers, as well. It comes packaged with Smartcom I™ communications software.

Speaking of software, more programs are written for Hayes modems than for any other. And that impressive list includes our own incomparable communications software.

Smartcom II.™ Complete, menu-driven software for the IBM PC, DEC Rainbow 100,™ Xerox 820-II™ and Kaypro II.™ Even first-time communicators will find success with Smartcom II. Screen prompts guide users in the simple steps it takes to create, send, receive, list, edit, name and re-name files.

Tasks like simultaneously receiving, printing and storing data—completely unattended—are easily managed with Smartcom II, because it takes full advantage of Smartmodem's capabilities.

The program reduces lengthy dial-up and log-on sequences to a single keystroke. It stores communications parameters for 25 remote systems.

Plus, there's an on-line help feature that explains prompts, messages and parameters.

Our reputation speaks for itself. Hayes has five years of solid leadership in the microcomputer industry. Nationwide availability through retail computer stores. Trouble-free factory service and call-in assistance. A limited two-year warranty on all hardware. And the most efficient telecomputing system available. Anywhere.

If you're involved in linking micros or setting standards for configurations, remember this. Everything your people need to know about communications can be summed up in one word: Hayes.

Hayes®

Hayes Microcomputer Products, Inc., 5923 Peachtree Industrial Blvd., Norcross, GA 30092. 404/441-1617.

Smartmodem Specifications
Low Speed Data Formats (Smartmodem 1200 and Smartmodem 300): Serial, binary, asynchronous: 7 or 8 data bits; 1 or 2 stop bits; odd, even or no parity (0-300 bps).
High Speed Data Formats (Smartmodem 1200): Serial, binary, asynchronous: 7 data bits; 1 or 2 stop bits; odd, even, or fixed parity or 8 data bits; 1 or 2 stop bits; no parity (1200 bps).
Dialing Capability: Touch-Tone® and rotary-dial pulse dialing.
Command Buffer: 40 characters.
Commands (unnecessary with Smartcom II software): A: Immediate answer. A/: Repeat last command. C: Transparent Carrier. D: Dial command, including pause dialing, waiting for second dial tone, auto-dialing and other features. E: Local echo. F: Full/half duplex. H: Switch hook. I/: Audio monitor. O: On-Line. P: Pulse dialing. Q: Quiet mode. R: Reverse originate/answer mode. S: 17 "Set" commands speed, escape code character, number of rings to answer on, etc. S?: Check operational parameters shown. T: Touch-Tone dialing. V: Verbal result codes.
Result Codes (can be numeric/verbal): HOK: Command line ok. 1/Connect: Carrier detected. 2/Ring: Phone is ringing. 3/No Carrier: Carrier lost or never heard. 4/Error: Error in command line. 5/Connect 1200: Carrier detected at 1200 bps. (Smartmodem 1200 only.)
Audio Monitor: Two-inch speaker with volume control.
User Panels: On-off switch, power pack, RS-232C connector, modular phone jack connector, volume control.
Operation: Full or half duplex.
Data Rates: 0-300 bps and 1200 bps for Smartmodem 1200; 0-300 bps for Smartmodem 300.
Interface: RS-232C.
Intelligence: Z80™ microprocessor with 4K byte control program for Smartmodem 1200; Z8 microprocessor with 2K byte control program for Smartmodem 300.
Modem Capability: Bell System 103 or 212A compatible originate or answer mode for Smartmodem 1200; Bell System 103 compatible originate or answer mode for Smartmodem 300.
Answer Sensitivity: -9dBm for Smartmodem 1200; -43dBm for Smartmodem 300.
Transmit Level: -9dBm.
Registration: FCC registered for direct connect to the nationwide phone system. Connects with modular jacks RJ11W, RJ12C, RJ21W, RJ22C.
Power Needs: 0.1. Rated 120VAC, 60Hz, 13.5VAC output.
Size: 1.5" x 5.5", x 9.0"

SYSTEMS & PERIPHERALS

Continued from page 76

for Intel Corp.'s Intellec Series II and III and Mohawk Data Sciences Corp.'s MDS-800 microprocessor development systems.

The Datasafe-24 was designed to replace the Intellec dual floppy drive, doubling the system throughput and offering a transfer rate of 625K byte/sec and an average access time of 85 msec.

Datasafe-24 reportedly has 24M bytes of unformatted (15M bytes formatted) storage. It costs $7,995. The MDS-256, a 256K-byte printer spooler option that permits printing while programming, costs $1,250.

Winchester Systems, Suite 4050, 400 W. Cummings Park, Woburn, Mass. 01801.

TERMINALS

COMPUTER COMMUNICATIONS, INC.
CCI 8274 group

Computer Communications, Inc. has announced the CCI 8274 remote cluster group, an addition to its Group 8000 family of IBM 3270-type terminal products.

The line consists of the 8274C remote cluster controller, the 8178 display station and the 8287 printer station. Product features include support for up to 40 IBM 3178-type displays; a user-selectable 26th status line on the screen that contains a cursor, row/column indicator, time of day and security key/lock password protection; and concurrent Ascii-to-IBM Synchronous Data Link Control protocol conversion.

The base price for the controller is $4,995; the display station costs $1,500, and the printer costs $2,500.

Computer Communications, 2610 Columbia St., Torrance, Calif. 90503.

INNOVATIVE ELECTRONICS, INC.
MC-80/600-1

Innovative Electronics, Inc. has introduced a communications processor that emulates an IBM 3274-51C communications controller running configuration support Level A.

According to the vendor, the MC-80/600-1 converts a Digital Equipment Corp. VT100-compatible terminal into a full-function IBM 3277 Model 1, 3722 Model 2, 3278 Models 1 and 2 terminal communicating with the IBM host using the Ebcdic Binary Synchronous Communications protocol.

The stand-alone, self-powered communications processor provides up to 16K bytes of read-only memory, 16K bytes of random-access memory and two serial communications ports.

The price for the basic unit is $1,495.

Innovative Electronics, 4714 N.W. 165th St., Miami, Fla. 33014.

NCR CORP.
5070 ATM

NCR Corp. has announced an interior automated teller machine (ATM) designed for the lobby environment of financial institutions and for uses in such sites as retail stores, airports, hospitals, office buildings and universities.

The 5070 can operate either as a full-function ATM or as a cash dispenser. Five thousand transactions can be performed before replenishment is necessary, the vendor said.

The ATM measures 49¼ in. by 32 in. by 29 in. and is priced at $13,250.

NCR, Dayton, Ohio 45479.

GRAPHICS SYSTEMS

GENISCO COMPUTERS CORP.
G-6200

Genisco Computers Corp. has introduced a color raster display system for applications such as computer-aided design and manufacturing, command/control and imaging.

The G-6200 is said to feature extensive color display capabilities. The basic configuration provides a 1,536 by 1,024 bit-map refresh memory that permits selection of 16 colors from among more than 16 million possible hues. Using optional memory cards, the color selection can be expanded to up to 4,096 colors, a vendor spokesman said.

The G-6200 includes a 19-in. monitor, detached keyboard, pan, scroll, zoom, cursor control, various peripheral support and the vendor's Gencor operating system. Graph tablet, digitizing table, text terminal and color hard copy are supported, as well as both RS-232 serial interfaces and optional parallel direct memory access controllers, according to the vendor spokesman.

The product is available in models with three viewable resolutions: the G-6210, with a 396 by 1,024 bit-map refresh memory; the G-6220, with 768 by 512 noninterlaced refresh memory; and the G-6230, with 1,086 by 792 noninterlaced refresh memory.

The G-6210 and G-6220 are priced at $23,950. The G-6230 costs $24,750.

Genisco Computers, 3545 Cadillac Ave., Costa Mesa, Calif. 92626.

ALPHA MERICS CORP.
Quicklead

Alpha Merics Corp. has announced a workstation reportedly designed for general-purpose computer-aided design.

Quicklead includes a central console incorporating a high-resolution color graphics display and keyboard, 8-in. diskette or optional Winchester disk storage, digitizing tablet, soft-

SYSTEMS & PERIPHERALS

Continued from page 77

ware and a large format plotter, according to a vendor spokesman.

The control console comprises an Intel Corp. 8086 16-bit microprocessor, 512K bytes of memory and an optional Intel 8087 coprocessor. The CRT is a bit-mapped, high-resolution display. The basic unit is provided with dual 8-in. diskette drives with 1M-byte capacity each, the spokesman said.

The digitizing tablet has an 11- by 11-in. digitizing area and a positioning device with three function keys. The plotter is the vendor's large format, flat-bed Alphaplot device, the spokesman said.

Prices for the system range from $14,990 to $21,100.

Alpha Merics, 20931 Nordhoff St., Chatsworth, Calif. 91311.

MODGRAPH, INC.
GX-100 F5

Modgraph, Inc. enhanced its GX-100 graphics terminal to offer the GX-100 F5 workstation, a graphics processor that runs Digital Research, Inc.'s CP/M operating system.

The GX-100 F5 features dual 5¼-in. disk drives, 64K bytes of random-access memory (RAM) and 768- by 586-pixel resolution. The GX-100 disk controller reads and writes 15 disk formats, the vendor said.

The system costs $4,545.

Modgraph, 1393 Main St., Waltham, Mass. 02154.

DIGIGRAPHIC SYSTEMS CORP.
Comgraph II

Digigraphic Systems Corp. has announced an integrated hardware and software system designed for graphics creation, teleconferencing, local meeting and executive review applications.

Comgraph II reportedly features IBM Personal Computer XT compatibility with data base access, color graphic creation, electronic presentation and audiographic teleconferencing. It allows graphic files to be structured in much the same way 35mm slide presentations are prepared in carousels, according to the company.

It is said to generate graphics with data received from a host mainframe or other data bases such as spreadsheet data using Digigraphic's spreadsheet package. Graphics can also be generated by drawing on the system keyboard or by utilizing electronic graphic tablets for free-form design. Users can also develop graphics on IBM Personal Computer XTs using Digigraphic software, the vendor said.

Graphics resolution is 640 by 400 pixels, and there is a range of 4,096 colors, according to the company.

Digigraphic's audiographic teleconferencing reportedly uses standard telephone lines to transmit voice and data, and allows users to choose between 1,200 and 4,800 or 9,600 bit/sec.

Available now, the basic Comgraph II workstation, Interact 3000, includes an Intel Corp. 8088 processor, an Intel 8087 coprocessor, 512K-byte random-access memory (RAM) expandable to 640K-byte RAM, a 5¼-in. floppy disk drive, 60M-byte fixed disk memory, a 13-in. color monitor, keyboard and a conference keypad.

It is priced at $22,500.

A smaller version, Interact 2000, will be available in April and is said to include less memory and less functional expansion capacity.

The Interact 2000 is priced at $13,500.

Digigraphic Systems, 10873 Yellow Circle Drive, Minnetonka, Minn. 55343.

POWER SUPPLIES

DATAPOWER, INC.
DP-200-R series

Datapower, Inc. has introduced a family of open-frame 200W output switching power supplies, the DP-200-R series.

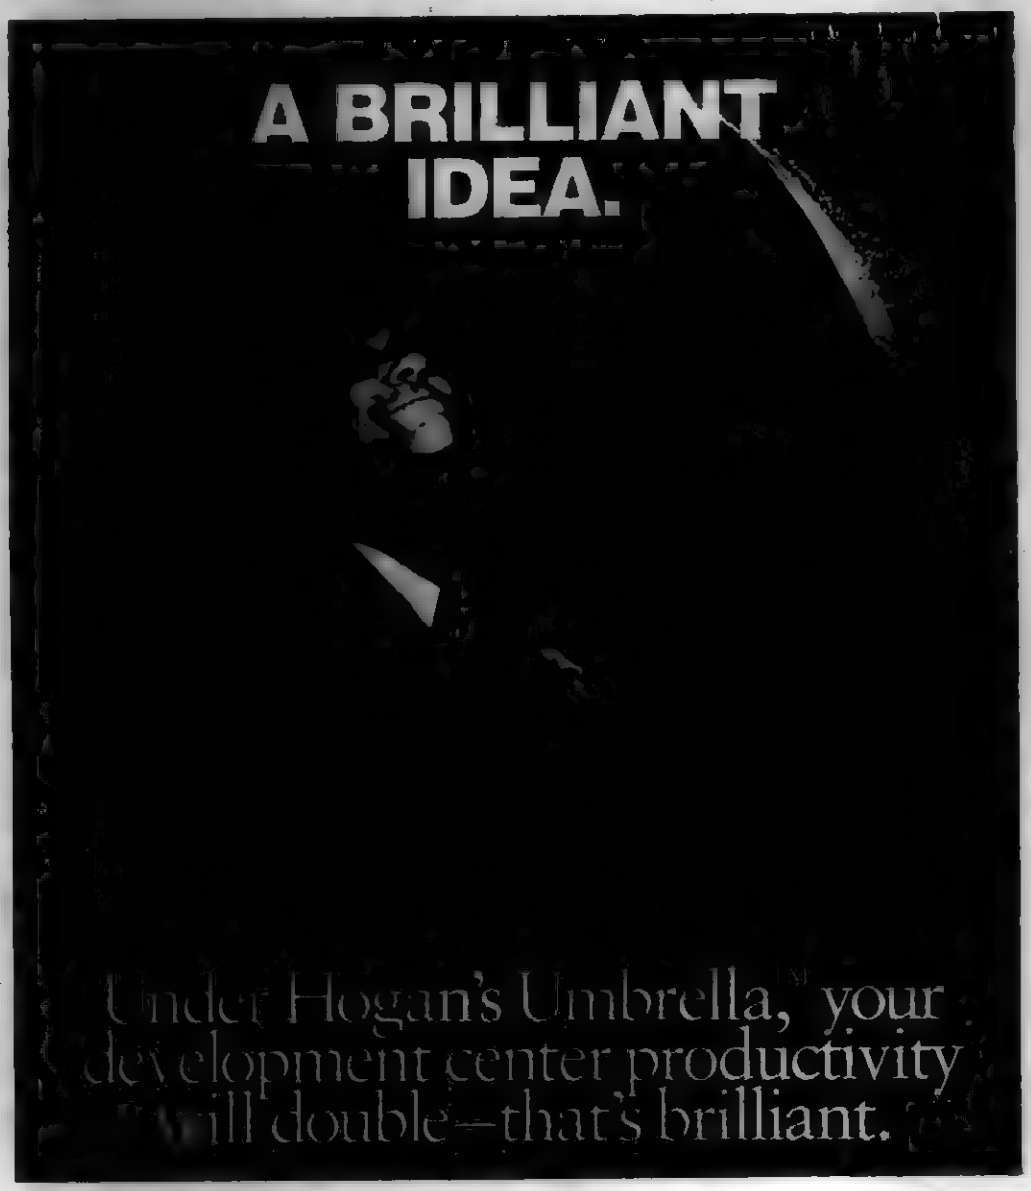
The series reportedly offers five regulated outputs and can function in a variety of voltage/current requirements.

The units are available in two model versions. The DP-200-R001's five outputs are factory preset at +5V/20A, +12V/4V, +12V/4A, +5V/2A and +24V/4V. Although the DP-2000-RXXX's five output levels are fixed at the same values as the factory preset model, the voltages can be specified by the user within the maximum power limit for the sum of all outputs, the vendor said.

Other features include internal radio frequency interference, electromagnetic interference, filtering to Federal Communications Commission and VDE noise suppression regulations, isolated returns on all outputs, remote sensing of cable losses and surge-limiting soft-start inputs.

The DP-200-R001 and the DP-2000-RXXX each cost $298, a spokesman said.

Datapower, 3323 W. First St., Santa Ana, Calif. 92703.



Imagine. A fully integrated development center system capable of upgrading and increasing output throughout the life cycle of both major and minor on-line and batch applications.

This completely automated approach to interactive development was critical in the development of our own highly successful line of applications software. That included design, management, programming, implementation, and maintenance of both on-line and batch applications. The Umbrella weathered well.

So well, in fact, users tell us that, "we beat our estimates by 50% on our very first major on-line application and that included our education time on the Umbrella."

There's a lot more the Hogan Umbrella can do. Just ask Any Umbrella user...various combinations of DOS, VS, MVS, IMS, VSAM, CICS, IDMS. And ask Ed Lomax, Vice President, at (214) 386-0020. Make a brilliant decision today.

Send me more information on your UMBRELLA System.

MICROCOMPUTERS

MICRO BITS
Tom Henkel

What IBM's move means to users

When IBM announced that its heretofore laboratory-oriented microcomputer, the System 9000, was available to commercial users capable of operating under Microsoft, Inc.'s Xenix operating system, it may have confused more users that it pleased.

The move means IBM is offering two lines of microcomputers aimed at the corporate user.

The popular Personal Computer line is based on Intel Corp.'s 8088 microprocessor and supports a variety of operating systems, including IBM's PC-DOS, Microsoft's MS-DOS and Digital Research, Inc.'s CP/M 86 and Concurrent CP/M. It also has recently gained support for an IBM version of Unix.

The newly announced 9002, which uses Motorola Corp.'s 68000 microprocessor, supports Xenix, some Unix applications and IBM's Caos — the operating system announced with the original System 9000, the 9001.

In addition, the 9002 supports the C programming language, as well as Ryan-McFarland Corp.'s RM/Cobol.

'Hedging their bets'

"It seems [IBM] is hedging their bets," noted Chris Christensen, an industry analyst with the Boston-based The Yankee Group. Christensen added IBM appears to be offering some kind of microcomputer for every type of user.

But which is the best buy for users? The answer is unclear. Certainly IBM, as well as third-party software vendors,

See 9000 page 81

IBM moves System 9000 into corporate sector

By Tom Henkel
CW Staff

RYE BROOK, N.Y. — IBM has moved its scientific-oriented System 9000 desktop microcomputer into the corporate sector with a more compact, four-user model supporting Microsoft, Inc.'s Xenix operating system.

Like the original System 9001, which was designed for laboratory use, the 9002 uses a Motorola, Inc. 68000 microprocessor with 32-bit registers, 16-bit data flow and 24-bit addressing. However, the 9002 occupies roughly 28% less table space than the 400-sq-in. 9001, allowing it to be installed on an average desktop. Aside from the reduction in size, the 9002 hardware is essentially the same as the 9001, IBM said.

The 9002 has 128K bytes of random-access memory, expandable to 5.2M bytes in 256K-byte increments. Also included are 128K bytes of read-only memory, which contains the Xenix operating system.

The announcement appears to offer corporate users of IBM microcomputers yet another choice. Currently, IBM's popular Personal Computer line, which is based on Intel Corp.'s 8088 microprocessor, can support Microsoft's MS-DOS, Digital Research, Inc.'s CP/M 86, IBM's PC-DOS and a version of the Unix operating system. Users have the option of selecting a multiuser 68000-based system that can run Xenix, plus many Unix-oriented programs.

The 9002 can support up to four 5¼-in. diskette drives offering 640K bytes of formatted storage or 8-in. diskette drives offering 985K bytes of formatted storage. Users can attach up to four 10M-byte hard disk drives to the 9002 system, IBM said.

Supports four users

Operating under Xenix, the 9002 can support up to four users in a multiuser, multitasking environment. Included with the Xenix operating system is a C compiler, text editor, text processing and file transfer capabilities. Xenix is based on Unix Version 7 operating system and includes enhancements developed by the University of Southern California at

Lotus 1-2-3, Chartman, Cheetah score high in package analysis

By Wing Lonie
Special to CW‡

This analysis provides information on specific features and performance characteristics of 13 application packages. Our objective in testing these packages was not only to ascertain specific features, but also to assess performance, reliability and ease of use.

The hardware charts are provided for the reader to be used as a quick reference to the configuration for each level's need. Although some hardware can be substituted, the level of compatibility is sometimes directly related to the software design.

Graphics software packages running on the IBM Personal Computer under IBM's PC-DOS are the basic requirement for this evaluation. We have defined three levels of graphics software, ranging from simple graphics like Lotus Development Corp.'s Lotus 1-2-3 to more elaborate ones like Centec Process Systems' Cheetah.

The levels are then arranged into categories and broken down into business

See LEVELS page 80

Microgate line enhanced

AUSTIN, Texas — Gateway Microsystems, Inc. has added three terminal emulators to its Microgate line of communications products for IBM's Personal Computer, Personal Computer-XT, Compaq Computer Corp.'s portable computer and Columbia Data Products, Inc.'s MPC micros.

Microgate 6530 is an integrated, hardware/software product that emulates the Tandem Computer, Inc. 6520/6530 multipage terminals. Microgate 6530 supports local communications at 19.2K bit/sec with enhancements such as 16 pages of recallable display memory and integrated data exchange capability.

Microgate 940 is an integrated product that emulates Texas Instruments, Inc. 940/931 EVT terminals, allowing Personal Computers to be used as terminals in the TI DS990 and Business Series systems.

Microgate 742 is a TI Model 742 terminal emulator said to allow IBM Personal Computers to be placed into most 742 polling environments.

Both the 6530 and 940 emulators employ Gateway's full-duplex, asynchronous host access (Flash) protocol for high-speed bidirectional data exchange between a Personal Computer and host. Minimum system requirements include 128K bytes of memory for the 6530 and 940 and 64K bytes for the 742.

Each product is priced at $395, including a Gateway serial communications controller printed-circuit card, a diskette and a user's guide. The 742 is supplied with a modem cable. A user-supplied modem plus cables for the 940 and 6530 are required for communications with the host system over dial-up telephone lines. The file transfer package is included with the 940, but is extra with the 6530 and priced according to the host system on which it is installed.

Gateway Microsystems is located at 9501 Capital of Texas Highway, Austin, Texas 78759.

Dynabyte unveils version of Monarch processor

MILPITAS, Calif. — Dynabyte Business Computers, Inc. has announced a version of its Monarch processor aimed at low- to mid-range users of the Basic Four Computer Systems Division of Management Assistance, Inc. minicomputers.

The Dynabyte system is based on both Intel Corp. 8086 and Zilog, Inc. Z 80 microprocessors, according to a spokesman for the company.

Based on Science Management Corp.'s Thoroughbred SMC operating system, the system, called the Monarch/Thoroughbred, is capable of running many nonproprietary Basic Four programs, such as specialized applications for the medical or veterinary fields, according to the firm's president William D. Parker.

A basic system includes a standard 256K bytes of random-access memory (RAM), which is expandable to 1M byte, a 5¼-in. Winchester disk drive capable of storing up to 92M bytes of data, an 8-in. floppy disk drive for backup storage of up to 800K bytes of unformatted data and a streaming tape drive which can accommodate up to 17M bytes of unformatted data and operates at 6,400 bit/in.

The Monarch/Thoroughbred system can support up to 16 users.

The price for an entry-level eight-user system, which includes 19M bytes of RAM, a 19M-byte Winchester disk drive, a floppy disk drive and the Thoroughbred SMC operating system, is $10,590, the spokesman said.

Additional information about the Monarch/Thoroughbred operating system is available from Dynabyte, which is headquartered at 521 Cottonwood Drive, Milpitas, Calif. 95035.

A closer look at two levels

Graphics software packages that fall into the Level 1 category — that which produces either simple graphics, specialized graphics or limited graphics — tend to be moderate in price or perform a single function well. Some special features are listed below:

■ Lotus Development Corp.'s Lotus 1-2-3 is excellent for using data and programming macros from its own spreadsheet to produce simple charts. Also, 1-2-3 is capable of performing complex mathematical functions.

■ Visicorp's Visitrend/Visiplot is excellent for data analysis and chart plotting. A user can enter and save business data and recall data to do complex forecasting and analysis to produce simple graphics.

■ Micrografx's PC-Draw is excellent for producing and creating custom design templates and for supporting light pens.

■ Digital Marketing Corp.'s PC-Crayon is excellent for general-purpose graphic design that can be used to create graphics symbols, vector symbols, cursor drawings and slide-show scenarios.

■ Datasoft, Inc.'s Graphics Generator is good for producing line charts and bar charts.

■ Desktop Computer Software, Inc.'s Graph 'n' Calc is good for mathematical calculations and simple spreadsheet functions.

■ Perox Microsystems, Inc.'s

See LOOK page 81

LEVELS from page 79

graphics, complex charts/visuals and machine requirements. The following paragraphs describe software and hardware configuration for each level.

Level 1 is a category of software which produces either simple graphics, specialized graphics or limited graphics. Simple graphics are defined as capable of producing basic bar, pie and line charts. Specialized graphics are packages capable of producing specific charts or graphs with ease. Limited graphics are software packages that can only perform limited functions. Level 1 software includes Micrografx's PC-Draw, Digital Marketing Corp.'s PC-Crayon, Lotus 1-2-3, Desktop Computer Software, Inc.'s Graph 'n' Calc, Visicorp's Visitrend, Datasoft, Inc.'s Graphics Generator and Perox Microsystems, Inc.'s Graph Power.

The advantage of Level 1 is that the software tends to be moderate in price and/or capable of performing a single function well.

The limitation of Level 1 software tends to be directly related to its cost. Generally, this group provides limited interface and limited device support with other software packages and hardware.

Recommendations for Level 1 software: Lotus 1-2-3 is an excellent multipurpose package which integrates spreadsheet, data base and graphics. It also provides an excellent tutorial and documentation.

Level 2 software produces most business graphs and some complex charts. Business graphics include pie, bar, line, XY, scatter, Gantt, organization and bubble charts. Complex charts include multiple type and size fonts and basic geometric shapes. Level 2 includes Business & Professional Software, Inc.'s BPS Business Graphics, Decision Resources' Chartmaster, Giraph's Giraphy, Graphic Communications, Inc.'s Graphwriter

Ford Marwick & Co.

LEVELS from page 80

and Graphic Software, Inc.'s Chartman II.

Recommendations for Level 2 software: Chartman can solve many business graphics problems. It runs in compiled machine-language form and thus is the fastest in Level 2. The package is very easy to use with predefined formats to help a user with little time to spend on reading documentation.

Level 3 is the category of software with which almost any type of graphics application can be produced. The only graphics system for the IBM Personal Computer which falls into this category is Centec Corp.'s Cheetah.

Cheetah, which comprises both hardware and software, offers the most features when compared with other packages. It is also very easy to use. Cheetah's system can produce most complex graphics and can be interfaced with a spreadsheet by converting data into Software Arts, Inc.'s Data Interchange Format (DIF). Although most graphics programs can work with DIF data, Cheetah provides a DIF conversion utility within its menu. Cheetah can therefore take data parameters in DIF format from other spreadsheets to generate graphics output. Furthermore, the full Cheetah system can produce in-house 35mm slides, paper copies or projector transparencies.

Although Cheetah is a very powerful package, it is also the most expensive. Systems range from $6,500 to $42,000 including all hardware and software. Cheetah is primarily designed for the medium- to large-size company with large quantities of business art work. In addition, the package may be too cumbersome to use due to the overabundance of prompts.

Recommendations for Level 3 software: Cheetah is recommended for the company with quantity art work. It works very well with no major flaws and is a "low-risk" investment for the large company because, regardless of whether the package is used extensively, the hardware can be used in day-to-day operations.

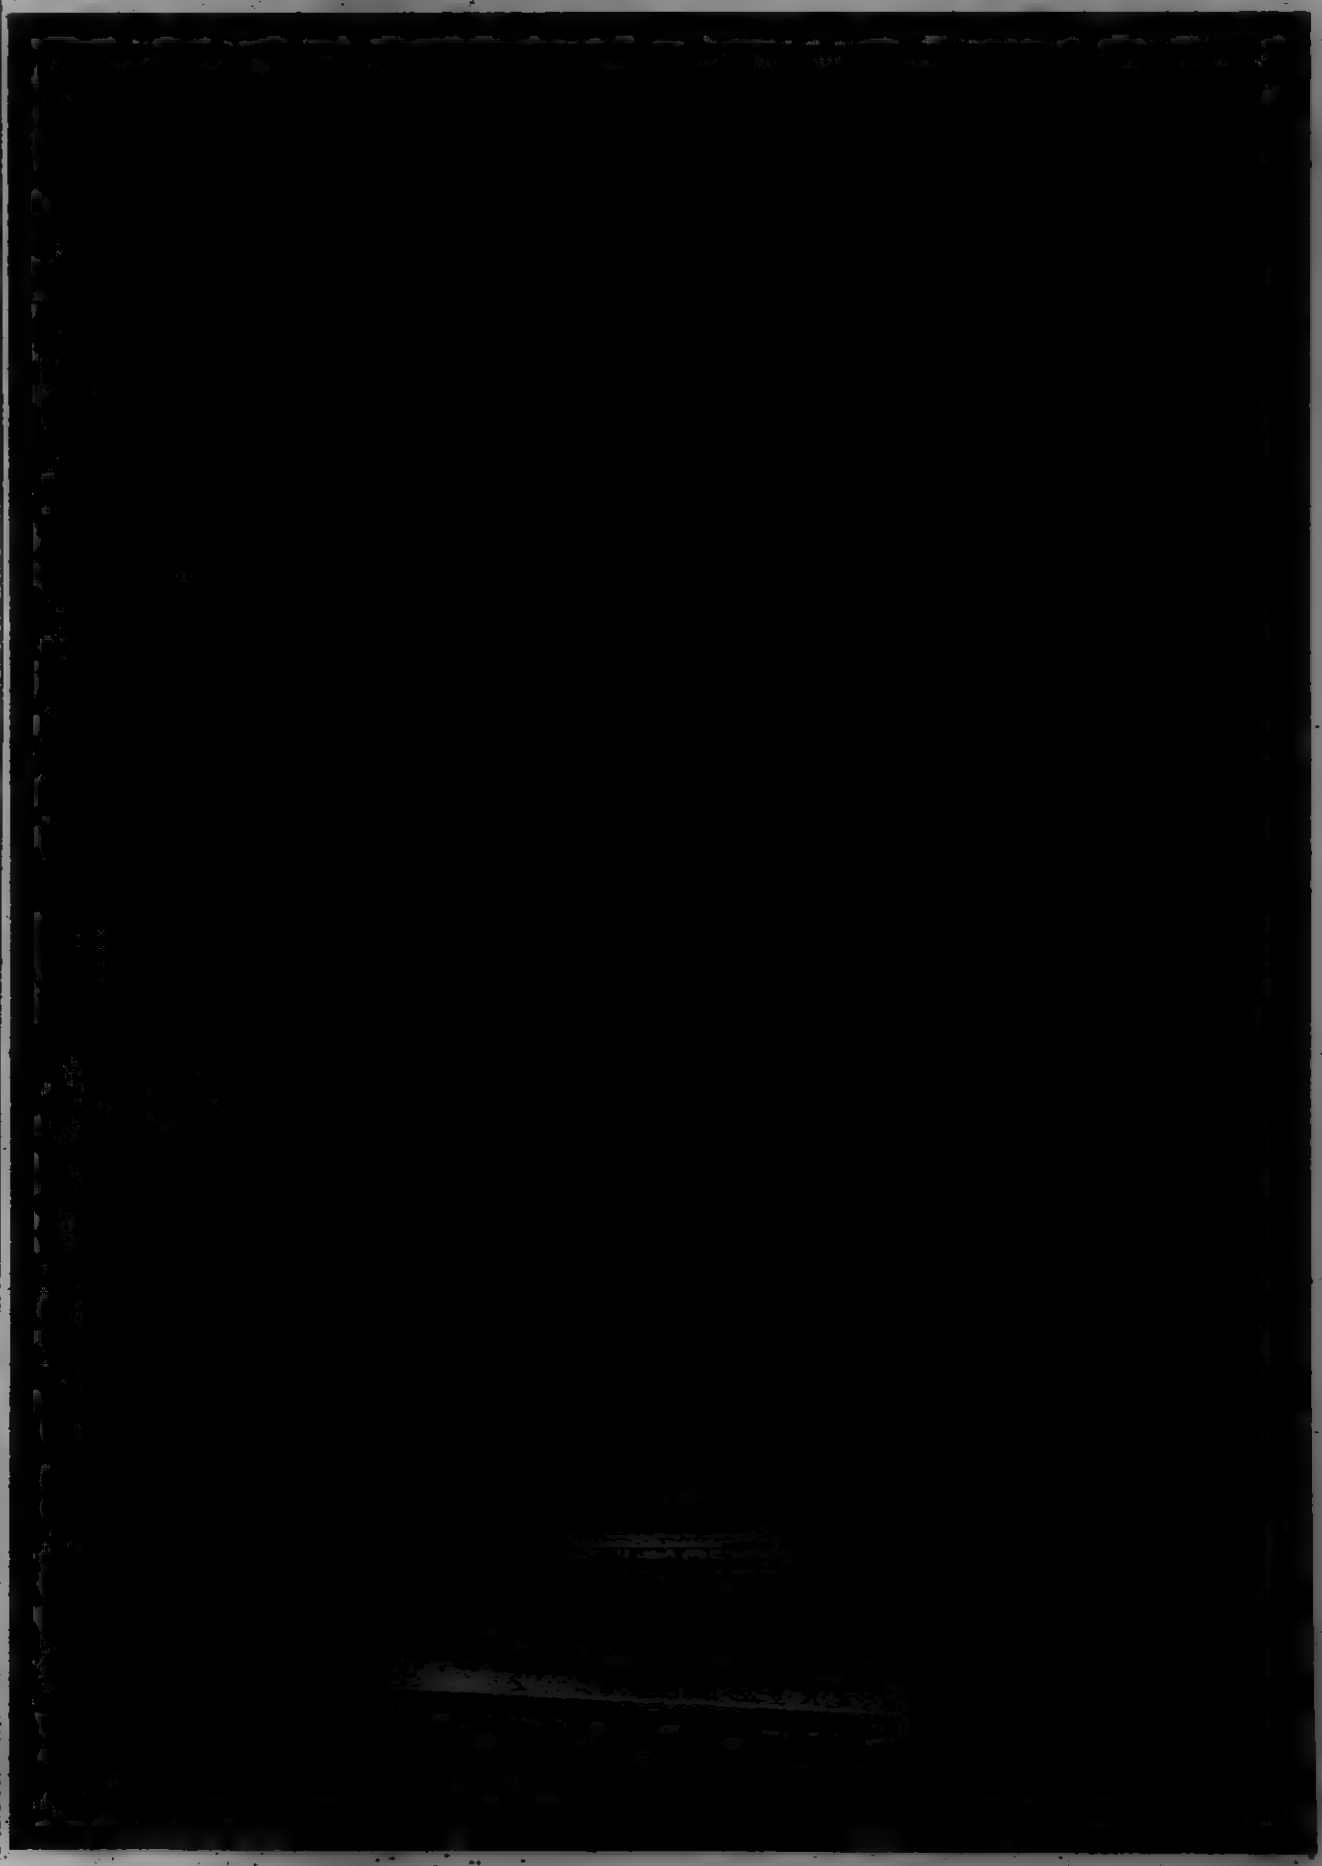
Louis is a computer specialist at Peat, Marwick, Mitchell & Co. in New York.

LOOK from page 80

Graph Power is good for character fonts and producing simple graphics.

Level 2 software is aimed at the business world. It tends to provide the best documentation of the three levels. Examples include:

- Business and Professional Software, Inc.'s BPS Business Graphics can interface with over 20 printers and plotters, produce simple graphics and perform complex mathematical functions.
- Decision Resources' Chart-Master produces six fonts with 16 sizes in color.
- Graphic Software, Inc.'s Chartman can produce simple graphics, Gantt charts, organizational charts and scatter plots.
- Graphic Communications, Inc.'s Graphwriter produces almost all types of graphs, including bubble charts.



9000 from page 79

has succeeded in developing a voluminous amount of software for the Personal Computer and Personal Computer XT. In fact, there is a whole submarket for compatible devices for the Personal Computer line. But there is also a fair amount of software available for Xenix and Unix, and up to four users can work on a 9002 at the same time, each running different applications. For small businesses, the 9002 may prove a more cost-effective alternative. For corporate users, Xenix may make it easier to develop micro-to-mainframe links.

Is it possible IBM plans to make the more powerful, multiuser 9002 its favored son, leaving the Personal Computer in the dust? In the rapidly changing microcomputer market, announcements that rock the boat can make customers think twice about which product to buy. No one wants to buy a bunch of micros that will become obsolete shortly. And no one wants to buy micros that have the dubious distinction of being different from the rest of the systems on the market. That is largely why IBM has been so successful in the microcomputer business — because it promised stability. Now that stability appears to be shaken.

MICROCOMPUTERS

SYSTEMS

DECIMUS CORP.
Microcheck

Decimus Corp. has introduced Microcheck, an item processing system for the IBM Personal Computer that is designed to help financial institutions with checking deposit analysis and reporting.

The main components of a basic system are an IBM Personal Computer; a Lundy Electronics and Systems, Inc. IMRS magnetic ink character recognition reader sorter; a Tecmar, Inc. fixed disk drive subsystem with 33M bytes of storage and 5M bytes removable storage; a Centronics Data Computer Corp. Linewriter 800 line printer; and a Decimus software package. The basic system is priced at $89,050.

Decimus, 3737 N. Main St., Walnut Creek, Calif. 94596.

COMPUTER SYSTEM ASSOCIATES
Micro 68000ECB Microcomputer Trainer

Computer System Associates has announced a self-contained educational microcomputer designed to teach technicians and engineers about the architecture of computers using the Motorola, Inc. 68000ECB board.

The Micro 68000ECB Microcomputer Trainer is a tutorial aid intended for use by colleges and corporations. It reportedly includes a 68000ECB board, 6A power supply, base plate, backplate allowing access to two RS-232 I/O ports, a parallel port and audio tape serial I/O port. According to the company, it has a resident firmware package for a self-contained programming and operating environment.

It is available now and is priced at $1,495.

Computer System Associates, 7562 Trade St., San Diego, Calif. 92121.

AES DATA CORP.
AES Savin 7100 Personal Work Station

AES Data Corp., introduced AES Savin 7100 Personal Work Station, a stand-alone word processing system which runs Digital Research, Inc.'s CP/M operating system.

The system features a 12-in. screen; a Zilog, Inc. Z80 microprocessor; 128K bytes of random-access memory; and an RS-232 serial port, the vendor said. A 45 char./sec daisywheel printer is included with the system, according to the vendor.

The system costs $5,995.

AES Data, P.O. Box 10272, 9 W. Broad St., Stamford, Conn. 06904.

CHASE TECHNOLOGIES, INC.
Chase DL expansion card

Chase Technologies, Inc. announced that its Chase DL microcomputer now comes with an Orchid Technology, Inc. PCnet expansion card.

Chase DL features an Intel Corp. 8088 microprocessor, nine expansion slots and 128K bytes of random-access memory (RAM), according to the vendor.

One expansion slot holds an Orchid Technology PCnet Plus multifunction card and 128K bytes of RAM, the vendor said.

Chase DL costs $2,395, the vendor said.

Chase Technologies, 375 Sylvan Ave., Englewood Cliffs, N.J. 07632.

ET COMPUTER SYSTEMS, INC.
ET-2010

ET Computer Systems, Inc. has introduced a personal and business desktop computer, the ET-2010.

The unit features 64K bytes of random-access memory expandable to 1M byte; a Zilog, Inc. Z80A 4 MHz microprocessor; a built-in 9-in. screen with 80 col. by 24 line display; parallel centronics and serial ports; and a 76-key typewriter-style keyboard with numeric key pad, the vendor said.

The operating system is ETPM II, an enhanced version of Digital Research, Inc.'s CP/M. Standard software includes spreadsheet, general ledger, accounts receivable and accounts payable programs.

The two-piece system, with two disk drives, a 9-in. CRT terminal and keyboard, sells for $1,349.

ET Systems, 8161 Broadway, Lemon Grove, Calif. 92045.

IBM from page 79

Berkeley. Users of the 9002 can also use IBM's Caos operating system, announced in 1982, along with the original 9001. In addition, IBM said users of the 9001 can also use Xenix.

The 9002, operating under Xenix, can support Fortran, Pascal and Ryan-McFarland, Inc. RM/Cobol programming languages. Fortran and Pascal cost $595, and RM/Cobol costs $1,250. All three languages are available through IBM, a spokesman said.

In addition to an 83-key keyboard, the 9002 is equipped with a 57-key membrane key pad for data entry. Each key on the key pad is user definable, IBM said.

Available in the second quarter, a basic 9002 desktop unit, including a keyboard, display and IBM's Caos operating system, costs $6,495; however, to use Xenix, users must add a 10M-byte hard disk drive and a memory management card. A system configured to run Xenix costs $15,960. There is a one-time license charge for Xenix of $995, and a single 10M-byte hard disk drive and cabinet cost $2,195. Memory enhancements for the 9002 cost from $1,395 for a 256K-byte upgrade to $3,190 for a 1M-byte upgrade, IBM said.

Xenix will be marketed through IBM Instruments, Inc. The 9002 is available through IBM Instruments and IBM's National Accounts, National Marketing and National Distribution divisions.

The system was announced by IBM's Information Systems Group, located at 900 King St., Rye Brook, N.Y. 10573.

Is your Mainframe suffering midlife crisis?

MICROCOMPUTERS

MICRO STORAGE

1² INTERFACE, INC.
1² Disksystem

1² Interface, Inc. has announced a 33M-byte disk subsystem for the IBM Personal Computer and compatible systems.

Called the 1² Disksystem, the unit reportedly includes a 33M-byte Winchester disk drive, cabinet, power supply, cable, connector and I/O adapter, according to the company.

Available now, the subsystem has a suggested retail price of $2,795.

1² Interface, 7630 Alabama Ave., Canoga Park, Calif. 91304.

SCIENCE AND COMMUNICATIONS, INC.
3400 Streamer

Science and Communications, Inc. has introduced 3400 Streamer, a 34M-byte, ¼-in. tape system for the IBM Personal Computer.

An intelligent front-panel display informs the user of the machine's status and permits 99 diagnostic tests.

Two models are available, one which stores 1,600 bit/in. and one which holds 3,200 bit/in. The 3400 Streamer costs $5,995; its 1,600 bit/in. model sells for $5,295.

Science and Communications, 352A University Ave., Westwood, Mass. 02090.

PRINTERS/PLOTTERS/PERIPHERALS

AXONIX CORP.
Thinprint 80

Axonix Corp. has introduced Thinprint 80, a battery-powered, full-page thermal graphics printer that weighs 4 lb.

According to the vendor, Thinprint 80 features 40 char./sec bidirectional printing, buffer memory, a print speed of 80 or 136 char./line and serial or parallel interface.

The product's retail price of $279 includes rechargeable batteries, an ac adapter and an 80-page roll of paper.

Axonix, 417 Wakara Way, Salt Lake City, Utah 84108.

BOARD-LEVEL DEVICES

WICAT SYSTEMS, INC.
Exrcom

Wicat Systems, Inc. has introduced a device to be used to provide remote training and servicing for its customers.

The Extended Remote Computer Control Service (Exrcom) was designed to connect a remote terminal to a host CPU. After the connection is made, the vendor said, the master console is able to observe while the remote user either tests or demonstrates software use.

Exrcom is available in two models. One model consists of the Exrcom device and cable connections and sells for $1,250. Another model includes an additional built-in modem and costs $1,500.

Wicat Systems, P.O. Box 520, 1875 S. State, Orem, Utah 84057.

AUXILIARY EQUIPMENT

GOULD, INC.
Personal Conditioner enhancement

Gould, Inc. has announced an enhanced version of its Personal Conditioner, a power line conditioner for the IBM Personal Computer XT.

Personal Conditioner with 400V can support a Personal Computer XT and printer, according to the vendor. The power suppressor filters noise from any amplitude, assures precise voltage and pure sine wave power to computers requiring up to 3.33A of 120V power, the vendor said.

Personal Conditioner costs $349.

Gould, Power Conversion Division, 2727 Kurtz St., San Diego, Calif. 92110.

MICRO SOFTWARE

U.S. SOFTWARE CORP.
68000 Fpac; 68000 Dpac Floating Point Libraries

U.S. Software has announced the 68000 Fpac and 68000 Dpac Floating Point Libraries, sets of subroutines used to process floating-point numbers in the proposed IEEE KCS (Kilo-characters Per Second) single- and double-precision formats for the Motorola, Inc. 68000 microprocessor.

According to the vendor, the systems are delivered in optimized source assembly language form to allow flexibility.

The price for the single-precision 68000 Fpac is $750, and the price for the double-precision 68000 Dpac, which includes the 68000 Fpac, is $1,250.

U.S. Software, 5470 N.W. Irvinebrook Place, Portland, Ore. 97229.

MICRO DATA BASE SYSTEMS, INC.
Kpaint; Ktext; Kgraph

Micro Data Base Systems, Inc. has added three modules to its Knowledgeman package for users of Microsoft, Inc.'s MS-DOS and Digital Research, Inc.'s CP/M 86 operating systems. The modules are: Kpaint, Ktext and Kgraph.

Kpaint allows the user to design forms interactively with 64 different foreground and background colors. Kgraph produces bar charts, scatter diagrams, pie charts and free-form diagrams, according to a vendor spokesman.

Ktext is a full screen text editor. Knowledgeman integrates a relational data manager, spreadsheet, statistical analysis, a screen I/O manager, printed form manager and programming language.

Kpaint costs $100, Ktext sells for $100 and Kgraph is priced at $225.

Micro Data Base Systems, P.O. Box 248, Lafayette, Ind. 47902.

See TOOLS page 84

Find a new mate.

New Attachmate-3270 adds multiple Mainframe windows to your IBM Personal Computer.

Attachmate's coax interface board can bring out the best in your existing mainframe.

When connected to your mainframe, your IBM Personal Computer can be as many as four 3278 terminals. You can work up to seven different programs and display each in a separate window.

Not one Not two But more windows

Looks just like a new IBM-3270 PC, doesn't it?

What's more:

- *Attachmate-3270 provides more mainframe security—only you have the key.*
- *You can coax connect to all existing 3270 control units and use in-place Bisync and SNA networks.*
- *You can share those high speed 3270 printers to save money, time, workspace.*
- *You can transfer files and share data with your mainframe and other PC's as well as access 3270 printer data to print, process, send or save.*
- *And, as a bonus, Attachmate's single-slot board can expand your memory by 256K bytes.*

What's less:

- *The price. Attachmate-3270 gives your mainframe and PC all of this new life—compatibility, flexibility, function and immediate delivery for less than $1,000. For more facts:*

Attachmate Corporation, (206) 644-4010, 3241-118th S.E., Bellevue, WA 98005. Dept. CW3

TOOLS from page 83

LATTICE, INC.
C Compiler Version 2

Lattice, Inc. has announced Version 2 of its C Compiler for the IBM Personal Computer and other computers using Microsoft, Inc.'s MS-DOS operating system.

Version 2 is said to enable C programs to access the complete 1M-byte program and data space that can be addressed by Intel Corp. 8086 and 8088 microprocessors. According to Lattice, four distinct memory models are supported. The S and P models produce code that can address up to 64K bytes of data, while the D and L models allow access up to 1M byte of data. Program size is 64K bytes in the S and D models and 1M byte in the P and L models.

Version 2 of the C Compiler is available from Lattice for $500, and the library source code has been reduced from $1,500 to $500. Current users of the compiler can obtain an update by contacting the point of original purchase.

Lattice, Box 3072, Glen Ellyn, Ill. 60138.

REALIA, INC.
Realia Cobol

Realia, Inc. has announced Realia Cobol, a compiler that also tests IBM VS Cobol programs on an IBM Personal Computer or Personal Computer XT.

For a floppy disk system, the compiler reportedly completes 700 to 1,500 lines of code/min. For a hard disk system, 1,200 to 2,600 lines of code are compiled per minute, the vendor said. The compiler accepts Ansi 74 Cobol with extensions programs and supplies structured programming facilities, according to the vendor.

The compiler features a cross-reference listing, an expanded code listing, symbolic debugger and a nonlicensed runtime library, according to the vendor.

Realia Cobol costs $995.

Realia, 10 S. Riverside Plaza, Chicago, Ill. 60606.

SOFTREND, INC.
Aura

Softrend, Inc. has announced Aura, an integrated package that includes data base management, spreadsheet, word processing and graphic applications.

Using a menu-driven interface, users can sort, select, edit and index data stored in the data base management system, according to the vendor. The spreadsheet function links different spreadsheets, supplies 255 col. and 63 rows for a spreadsheet, offers 50 statistical functions and includes a zoom function which allows the user to inspect data in related spreadsheets, according to the vendor.

The word processor can edit several documents concurrently and move text between documents. The word processor reportedly features unlimited document length, rulers, headers, footers, advanced print control and multiple copy printing. The graphics module produces free-form as well as presentation quality graphics, the vendor said.

The package is written in the C programming language. It requires 256K bytes of random-access memory and either a hard disk or two double-sided, double-density drives.

The program costs $495.

Softrend, 2 Manor Pkwy., Salem, N.H. 03079.

SOFTLOGIC SOLUTIONS
Doubledos

Softlogic Solutions has released Doubledos, an operating system enhancer that is said to allow the IBM Personal Computer and Personal Computer XT to accomplish two functions simultaneously.

By dividing a system's memory into two user-determined areas, Doubledos allows two programs to be run at the same time. A program may be loaded into either memory area and then allowed to process in the background without keyboard interaction, the company said.

Doubledos works with Release 1.1 or 2.0 of IBM's PC-DOS operating system and requires a minimum of 128K bytes of memory.

Doubledos is priced at $200.

Softlogic Solutions, 530 Chestnut St., Manchester, N.H. 03101.

VIKING SOFTWARE SERVICES, INC.
Viking Forms Manager

The Viking Forms Manager (VFM), an on-line screen formatter and data entry software package from Viking Software Services, Inc., is now available for Digital Equipment Corp.'s Professional 300 series personal computers.

According to Viking Software, all programming is eliminated to create, update and key-verify data files. The package features three levels of data validation.

VFM consists of a forms development facility, the Viking data entry software and a variety of utility programs. The single quantity price is $600 with quantity discounts available.

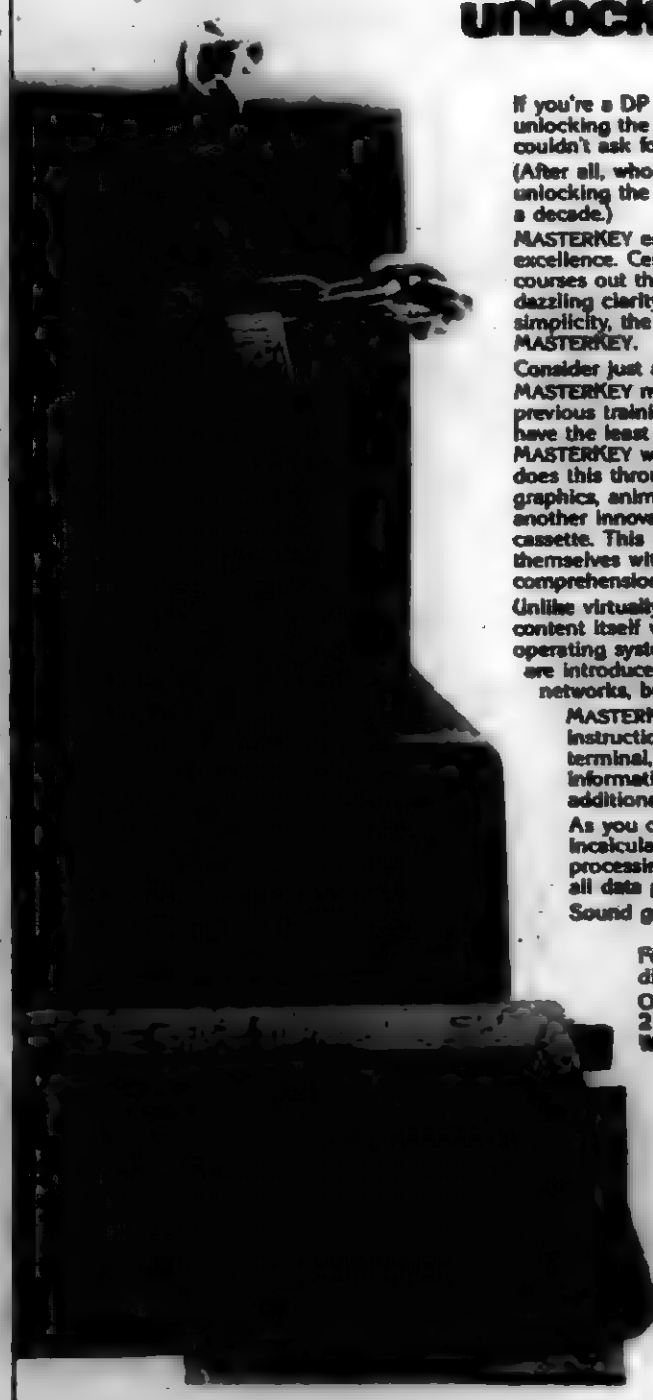
Viking Software Services, 2815 E. Skelly Drive, Tulsa, Okla. 74105.

OFFICE SOLUTIONS, INC.
Officewriter 2.0

Office Solutions, Inc. has released an updated version of Officewriter, a word processing package for the IBM Personal Computer, Personal Computer XT and compatible systems.

Officewriter 2.0 includes such

ATS introduces MASTERKEY.
The ultimate way to unlock the mysteries.



If you're a DP Manager, you know that when it comes to unlocking the mysteries of the IBM® PC for your people, you couldn't ask for a more brilliant source than ATS.

(After all, who has more experience than we do? We've been unlocking the mysteries of computers for more than a decade.)

MASTERKEY establishes a whole new standard of tutorial excellence. Certainly, there are other good IBM PC teaching courses out there. Yet none combines in one package, the dazzling clarity, the building block by building block simplicity, the sweeping, comprehensive range of MASTERKEY.

Consider just a few of its advantages:

MASTERKEY makes learning a snap for anyone. It requires no previous training whatsoever — even for those who seem to have the least aptitude. In astonishingly little time, MASTERKEY will give them a solid grasp of the IBM PC. It does this through an extraordinary combination of powerful graphics, animation and sound. MASTERKEY also boasts another innovation: an interactive but separate audio cassette. This unique concept allows students to pace themselves with far greater ease, thereby making comprehension practically effortless.

Unlike virtually every other course, MASTERKEY doesn't content itself with just teaching the keyboard and the operating system. It goes well beyond that. Students are introduced to word processing, communications networks, business graphics and spreadsheets.

MASTERKEY leaves nothing unexplored. It offers full instruction on how to use the IBM PC as a smart terminal, and how to access, retrieve and store information from S/34-38. It even advises you on what additional software you may need.

As you can see, MASTERKEY is a tool of incalculable value. It enables you and your data processing department to take firm control over all data processing functions.

Sound good?

For more information — or to order MASTERKEY directly — simply call the number below.

MICROCOMPUTERS

functions as spreadsheet and a data base interface. Other features are a document-to-Ascii conversion, horizontal scrolling, right justification and column move/copy/delete, the vendor said.

Officewriter 2.0 costs $325 and includes a user's guide, function key template, reference ruler and key top labels.

Office Solutions, 5702 Odana Road, Madison, Wisc. 53719.

DATAMATE CO.
Pastfile

Datamate Co. has introduced a personal data base system written in Ryan-McFarland Corp.'s RM/Cobol for the IBM Personal Computer and compatibles.

Pastfile is said to enable the user to create, update, sort and print data files without writing programs. The program has an integrated English language report writer, which includes an automatic formatting capability.

The product has up to 50 data fields per item, utilizing as many items as the user's disk will hold. One item record may contain a maximum 2,048 bytes of information, according to the vendor.

The program requires 128K bytes of storage and a printer.

Pastfile retails for $495, the vendor said.

Datamate Co., Suite 125, 4135 S. 100th E. Ave., Tulsa, Okla. 74146.

COMPUTER TEACHING CORP. COURSEWARE APPLICATIONS, INC.
Encore Language System

Computer Teaching Corp. and Courseware Applications, Inc. have introduced the Encore Language System for the IBM Personal Computer. The software package reportedly provides the features necessary to develop computer-based training materials.

Features include an authoring language, stand-alone programming capability, integrated development utilities, color graphics support, user-definable character sets, mouse and light-pen support, documentation, on-line language reference manual and student recordkeeping system.

For development use, the system requires an IBM Personal Computer or Personal Computer XT with 192K bytes of memory, two disk drives and a color graphics adapter.

The system costs $2,000 and is available now.

Courseware Applications, 906 Burwash, Savoy, Ill. 61874.

NORTHWEST ANALYTICAL, INC.
Statpak Version 3.1x

Northwest Analytical, Inc. has announced Version 3.1x of Statpak, a multifunction statistics library for personal computer users.

Statpak includes data management and manipulation with a library of data analysis functions. According to the vendor, the data can be manipulated with an array of functions including deseasonalization, user-defined transformations and subset selection.

Statpak is available on Digital Research, Inc.'s CP/M and Microsoft, Inc.'s MS-DOS, operating systems and requires Microsoft or Microsoft-compatible Basic.

Individual licenses cost $495.

Northwest Analytical, 1532 S.W. Morrison St., Portland, Ore. 97205.

INVENT SOFTWARE, INC.
Recover

Invent Software, Inc. has announced Recover, a disk file utility that allows users to retrieve files erased from the disk.

According to the vendor, all files that had appeared on the directory can be retrieved by typing in the file name.

Recover runs on IBM's PC-DOS, Microsoft, Inc.'s MS-DOS and Zenith Data Systems Corp.'s Z-DOS on IBM, Zenith and compatible computers.

The list price is $49.95.

Invent Software, 199 Willis Ave., Mineola, N.Y. 11501.

SOFTRONICS, INC.
Softerm 2 emulation program

Softronics, Inc. has announced that its Softerm 2 terminal emulation program emulates four new terminals.

Designed to allow the Apple Computer, Inc. Apple II and Apple IIe personal computers to operate like 24 other intelligent terminals, Softerm 2 now also emulates the Hewlett-Packard Co. 2622A, the Honeywell, Inc. VIP7801 and VIP7803 and the Televideo Systems, Inc. 950.

It is now available for $195.

Softronics, 3639 New Getwell St., Memphis, Tenn. 38118.

DIGITAL EQUIPMENT CORP.
Graphplan-86

Digital Equipment Corp. has announced that Graphplan-86, an integrated graphics and spreadsheet software package for the firm's Rainbow microcomputer, is now available.

Developed by Chang Laboratories, Inc., Graphplan-86 is a 16-bit program running under DEC's CP/M 86 or CP/M 80 operating systems.

Minimum hardware requirements are a Rainbow 100 or 100+ computer with DEC's Graphics Option Module and 128K bytes of memory. The Graphics Option Module comes with the GSX-86 graphics utility software that enables Graphplan-86 to display charts on such output devices as color or monochrome video monitors, dot matrix printers and pen plotters.

Priced at $295, Graphplan-86 comes with diskette, license and documentation.

DEC, Maynard, Mass. 01754.

GREAT PLAINS SOFTWARE
Version 3.0 Hardisk Accounting Series

Great Plains Software has announced Version 3.0 of its Hardisk Accounting Series microcomputer software.

The Hardisk Accounting Series reportedly consists of modules for general ledger with financial reporting and budgeting, accounts receivable, accounts payable, payroll and inventory management with point-of-sale invoicing.

In the general ledger module, the cross-account number has been expanded to allow up to 99 accounts.

Also, a monthly sales entry and editing program has been added to the accounts receivable module to reduce the need to reenter transactions that recur monthly. An option to the accounts payable module allows the user to print the check register in check number order, and the payroll module now supports tax sheltered annuities.

A point-of-sale entry feature added to the inventory management module uses a cash drawer that enables the system to perform as a cash register.

Modules in Version 3.0 of the Hardisk Accounting Series are priced at $595 and are available for the IBM

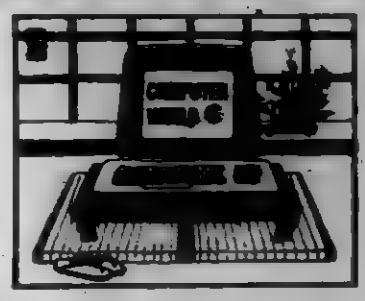
Computerworld/Japan can bring your message to the world's second largest computer market.



The Japanese computer industry is growing at a rate of 20% per year. There are currently more than 101,000 installed general purpose computers valued at over $18 billion. This figure does not include minis, micros and personal computers. Small business computers are currently the leading growth sector in the Japanese computer market.

Japan is looking for well-developed technology that will meet their future needs. And with no strong independent software industry of its own, Japan offers great opportunity for U.S. manufacturers in the packaged software market.

Computerworld/Japan is a weekly publication covering the latest developments in the Japanese computer industry with reports on new products, services and trends. Its 30,000 subscribers include top management and DP professionals throughout the country.

CLEO SOFTWARE
Cleo 3270; Cleo 3780

Cleo Software has introduced two communications software packages that allow the Hewlett-Packard Co. HP 150 to emulate IBM 3270 and 3780 terminals.

The Cleo 3270 and 3780 packages utilize one of the RS-232 ports on the HP 150, and no additional hardware is required, according to the vendor. For the HP microcomputer, the suggested license price for both packages is $500.

Both 3270 and 3780 also run on Industrial Micro Systems microcomputers running Musys Corp.'s Turbodos 1.3 operating system. The 3780 supports IBM's Binary Synchronous Communications protocol for high-speed transmission, up to 9,600 bit/sec and reception of data files over telephone lines. The license price for the 3780 is $395, and the price for 3270 is $750.

Cleo Software, 461 N. Mulford Road, Rockford, Ill. 61107.

COMPUT-TOME, INC.
CT-OS 86

Comput-Tome, Inc. has announced an enhanced version of its word processing software that will run under Digital Research, Inc.'s CP/M 86 operating system.

According to the vendor, CT-OS/86 is targeted for use with Digital Equipment Corp.'s Rainbow personal computer. With it, users are able to transfer word processing files from DEC VAX and PDP-11 series host processors to Rainbows and to a variety of other personal computers that use the operating system.

The product provides search and replace, cut and paste, list processing, Ascii file handling, 132-col. document width, stored text libraries, right-justified margins, scientific character set and a repertoire of user-defined keys to invoke special word processing functions.

CT-OS/86 is priced at $950 for a single-user license, including list processing, spelling corrector and full documentation. Delivery takes 30 days after receipt of order.

Compu-Tome, 234 E. Colorado Blvd., Pasadena, Calif. 91101.

AARON/SMITH ASSOCIATES, INC.
Finder

Aaron/Smith Associates, Inc. has announced Finder, a data retrieval package for users of IBM Personal Computer and Personal Computer XT microcomputers as well as those manufactured by Radio Shack.

The package runs on IBM micros equipped with IBM's PC-DOS Release 2.0 operating system, the vendor said.

It also runs on Radio Shack TRS-80 Models II, 12 and 16 (running as a 12), with Radio Shack's TRS-DOS operating system Release 2.0 or 4.2. The minimum main memory requirement is 64K bytes for both IBM and TRS-80 systems, the vendor said.

Finder was designed to store and retrieve textual information using large data bases.

The package was designed for use by libraries, information centers and records managers, according to the vendor.

Aaron Smith Associates, Suite 518, 1422 W. Peachtree St. N.W., Atlanta, Ga. 30309.

FASTWEAR, INC.
Thor

Fastwear, Inc. has announced Thor (thought organizer), a thought-processing package for the IBM Personal Computer and Personal Computer XT.

According to the vendor, Thor integrates the free-formatting facility of a word processor and the filing and retrieval capabilities of a dedicated data base manager into a single program.

Thor reportedly allows the user to record, categorize and retrieve thoughts without any knowledge of computer syntax. Thoughts can range in size from one line to multiple pages.

Minimum system requirements are 128K bytes of memory running DOS 2.0 or more current.

Thor is priced at $295.

Fastwear, 300 Freeway Drive E., East Orange, N.J. 07018.

ADVANCED SYSTEMS CONCEPTS, INC.
Protact

Advanced Systems Concepts, Inc. has announced the extension of its Integrated Applications Control package for the Digital Equipment Corp. Professional 300 series microcomputer.

Protact was designed to provide terminal, file and network management for the Professional 300 series. It allows one or two users to access applications on a local or remote Professional, DEC PDP-11 or VAX processor.

According to the vendor, Protact file manager uses DEC's Record Management Services as its file access method.

A Protact developer's kit is priced at $2,500; a runtime license costs $395, and the terminal server costs $595.

Advanced Systems Concepts, 22 Hudson Place, Hoboken, N.J. 07030.

COMPUTER INDUSTRY

INDUSTRY INSIGHT
Jeffrey Beeler
CW West Coast Bureau

'PC/34' to debut? Predictions vary

IBM is said to be preparing the introduction of an additional small business processor that will fall somewhere in performance between the company's System/36 and its Personal Computer XT.

A scaled-down version of the System/36 would make a logical addition to Big Blue's existing small business computer product line, according to a sampling of industry watchers.

But on the question of exactly what form the predicted processor is likely to take, the sources' opinions sometimes differ sharply.

One user source, who asked not to be identified, foresees the introduction of an "entry-level" System/36 that will incorporate just one diskette slot and cost less than $20,000. The low-end addition to the System/36 family will probably be announced "within the next 45 days," according to the source.

Echoing the prediction of a stripped-down System/36 announcement is Brian Jeffery, research director at the Palo Alto, Calif.-based International Technology Group, Inc. Jeffery expects the System/36 extension to occupy a critical place in an IBM product spectrum that will also eventually include an additional microcomputer capable of emulating the company's most popular small business processor, the System/34.

Tentatively nicknamed the "PC/34," the hypothesized micro will be aimed mainly at small businesses and will be intended to provide a migration route for users of IBM's existing Personal Computer XT, Jeffery predicted.

IBM's small business systems lineup would include — in ascending order — the Personal Computer, Personal Computer XT, PC/34, System/34, entry-level

See IBM page 106

Off-site backup spreading

By Robert Batt
CW West Coast Bureau

MENLO PARK, Calif. — The proliferation of microcomputers in Fortune 1,000 type organizations and fears of natural disasters and computer hackers have resulted in a surge in demand for off-site storage protection, according to service providers.

"The spread of micros in particular is drawing attention to the need for off-site storage," according to Jim Valentine, president of Secured Data Services, Inc. "Without adequate backup arrangements, the personal computer will cause a lot of problems."

The increase in awareness has also resulted in data processing managers being burdened with protecting the company's information assets as well as performing their day-to-day activities, and often they cannot cope, off-site storage providers told *Computerworld* recently.

According to Bill Dreyer, vice-president of marketing for the Iron Mountain Group, an off-site security firm in Rosendale, N.Y.; "Data processing managers are feeling the pressure. They need help and assistance. The main problem is that they are looked to to provide solutions, but they do not have the resources to identify all the information that should be backed up."

Nevertheless, security firms are reporting a big increase in demand for their services. "Since we opened our doors a year ago, we have been doubling our business every few months. We now have 100 clients alone who store computer materials, and we expect to double that figure by the end of the year," said Donald Rickgauer, executive vice-president of National Safe Depository (NSD), based in San Jose and serving the Silicon Valley area.

The number and type of storage clients vary widely. For example, Secured Data Services in Ohio opened 18 months ago and now has 24 customers storing computer media in fields such as energy, transportation and the financial sector. Iron Mountain, established in 1967, has five storage facilities and about 1,200 customers, many of them banks and high-technology manufacturers from the Northeast.

Most storage firms provide courier service to and from their clients' facilities. This is reportedly of vital importance, especially to large organizations that need their backup data available on a monthly

Honeywell refocusing services

By Peter Bartalik
CW Staff

NEWTON, Mass. — Third-party maintenance presents an opportunity for Honeywell, Inc. to prepare for recessionary times and to utilize a cadre of service engineers whose relative value declines as hardware reliability increases and cost decreases.

Those are the primary reasons why Honeywell is engaged in a year-old effort to turn its service organization into a service business, according to Sy Kraut, Honeywell vice-president and general manager of the company's Customer Services Division headquartered here.

A third factor, he said during a recent interview, is that smaller microcomputer vendors simply cannot afford to carry a nationwide service organization.

Honeywell, which celebrates its centennial in 1985, has been in the service business for more than 25 years, Kraut said. The company hopes to build on that tradition and move into the hierarchy of the top six third-party maintenance vendors who, according to Kraut, earn 51% of third-party maintenance revenues in the U.S. "I've seen figures saying that in 1984 there could be $800 million to $1.2 billion in third-party maintenance; we feel we can pick up our fair share of that," he said.

The company has evolved the concept of the Integrated Service Supplier, which means providing service to a business that may have many types of computer-related equipment from many suppliers. According to Kraut, a businessman with hundreds of varied processors, terminals, modems, private branch exchanges and local-area networking "wants to be able to call one

The ta… from IDC's … Session on two easily digestible Conference Journal Cassettes from DELTAK and CW Communications

What eight emerging technologies will revolutionize the office of tomorrow? Will the AT&T breakup change the course of telecommunications? What's next for personal computing?

For the answer to these and many other critical questions, don't miss "IDC Computers the Future," two 30-minute Conference Journal programs videotaped on location during the December User Briefing. Featuring a distinguished panel of professionals from International Data Corporation, the "watchdog" of the information industry for over twenty years.

In Part I of this series, Will Zachmann and Tom Willmott discuss the impact of new technologies on the evolving office, both today and tomorrow. Then Neil Kleinman, IDC's graphics expert, gives you an insider's view on the state of computer graphics. In Part II, noted MIS author John Gantz joins forces with Zachmann to shed exciting new light on the future of personal computing.

But here's the best part. You and your associates can "attend" this lively, informative video conference over lunch—without ever leaving the office! To order or find out about other Conference Journals, call DELTAK at (800) 323-7686; in Illinois, (312) 369-2000.

Analysts predict 'breakout' for robotics in '84

COVERAGE LEADER
Bohdan Szuprowicz

After several false starts in previous years, industry observers and analysts are now predicting that 1984 will be the real "breakout" year for robotics.

Much of this optimism assumes that industrial plants will begin to modernize in earnest, as the economic recovery picks up steam and firms install robots to compensate for high labor and operating costs.

Most recent estimates of overall robot markets continue to be bullish, estimating robot sales of $240 million in 1983 and a $2 billion market by 1990. But the robot promoters often forget that the proliferation rate of robot manufacturers in recent years was probably even higher than that. This has eroded any profits for robot suppliers.

There are believed to be between 200 to 300 Japanese robot suppliers, up to 100 American and several dozen European firms all chasing a relatively small market in which only about 15 suppliers are expected to survive with a reasonable market share to make a profit.

This flood of competitors in the robotics field is largely blamed on excessive "media hype" which often extolls the benefits without giving equal time to the potential and real problems associated with extensive use and rapid introduction of robots. A major concern is the loss of jobs at a time when unemployment in all the industrialized countries is breaking record levels. Political pressure on Congress is mounting to estimate the labor dislocation resulting from use of robots in the future and to come up with proposed remedies and sources of funds to implement such programs.

As a result, many manufacturers may be reluctant to install robots in their plants until the issues are resolved and they are assured that future labor and government action will not force them to engage in expensive retraining projects or that they will not be otherwise taxed or penalized for introducing automation that results in permanent elimination of jobs in their respective industries.

One industry where robots are making rapid inroads is electronics. Productivity in electronics plants can be improved significantly through the use of electronic assembly robots that are designed to pick and insert nonstandard parts and components into printed-circuit boards of electronic equipment assemblies. The electronic assembly robot market is in a truly emerging stage, estimated at only $3 million to $4 million today but expected to grow 74% annually through 1985, more than twice as fast as the overall robotics market. It will probably reach a $500 million market by 1990, becoming the most sophisticated segment of the robotics industry.

Critical to future productivity improvements in electronic assembly are the multivision robotic systems that depend on artificial intelligence and vision technologies as well as on precision and microcomputer controls. Price still remains a major deterrent because current vision-integrated robots cost about $125,000, while the market is unlikely to tolerate prices much above $40,000. Nevertheless, some new companies are already pioneering in this promising field with specialized robots designed to take advantage of these developing opportunities.

The latest entrant in this segment is Autobotics, a start-up specializing in robots designed to improve productivity of magnetic disk drive manufacturers. Few people are aware that about 32% of disk drives fail in-

McDonnell Douglas finalizes Tymshare acquisition

ST. LOUIS — McDonnell Douglas Corp. announced last week it has again agreed to acquire Tymshare, Inc., a move expected to boost McDonnell Douglas' subsidiary, McDonnell Douglas Automation Co. (McAuto), into the list of the three largest processing vendors.

The move had initially been announced late last year [CW, Dec. 5], but fell through. A spokesman for McAuto said the acquisition is basically the same as that announced previously, but that the parent corporation had as yet made no announcement about how Tymshare will be managed.

The value of the purchase has been reduced, perhaps reflecting Tymshare's net loss for 1983 of $1.5 million, a figure that had been reduced by favorable tax benefits from a total loss of $6.6 million.

In the fourth quarter of 1983, Tymshare posted a net loss of $1.4 million, reduced by tax benefits from a total loss of $3.5 million. In 1982, Tymshare had posted profits of $8.8 million, but had experienced a fourth-quarter loss of $2.3 million.

McDonnell Douglas, according to the spokesman, has a "definitive agreement" to purchase 12.3 million shares of Tymshare at $25 per share, for a total value of $307.5 million.

In December's announcement, the value of the acquisition had been placed at $372 million, or about $31 per share. Additionally, McDonnell Douglas has been granted an option to purchase 2.5 million unissued shares of Tymshare at $25 per share; those unissued shares had been priced in December at $31 per share.

The company intended to issue a tender offer for the outstanding Tymshare stock by last Friday, the spokesman added.

McDonnell Douglas will use Tymshare's Tymnet value-added communications network to expand into the financial services networking marketplace.

Cullinet airs 50% increase in revenues

WESTWOOD, Mass. — Cullinet Software, Inc. recently announced revenues for the third quarter ended Jan. 31 increased 50% over the corresponding period a year earlier, and profits increased 40% over the same period.

Sales for the three-month period were $31.3 million, compared to $20.9 million for the same period a year earlier. Profits for the quarter were $4.2 million, or 28 cents per share, compared to $3 million, or 21 cents per share, reported a year ago.

Cullinet reported that revenues for the nine months ended Jan. 31 were $84.8 million, up 54% over the same period a year earlier, with profits for the same period rising 45% to $11.6 million.

The company also reported that total costs and expenses were up 50.1% for the quarter and up 55% for the first nine months of fiscal year 1984, compared to year-earlier figures.

Cullinet earlier announced it had been awarded a $2.2 million contract to provide software and maintenance for the $350 million system integration project recently awarded by the U.S. Navy to Electronic Data Systems Corp. of Dallas.

Under that agreement, which reportedly involved multiple vendors in the largest benchmark test ever performed, Cullinet will provide the Navy with its IDMS data base management system for use with IBM 3081 and 4331 mainframes to integrate hardware, software and nationwide networks at each of two Navy supply centers.

The Northern Telecom system:
A benchmark in batch processing that keeps getting better.

Northern Telecom batch processing systems have proven themselves, in more than a decade of use in a variety of applications, to be among the most reliable, practical, cost-effective systems ever developed. They deliver more throughput per dollar than any competitive system.

Now, as solid evidence of our commitment to batch processing, we're improving these already-successful systems for even more productivity. For instance, we're introducing a new high-speed band printer with changeable type. Operating now with IBM's SNA, we've also added new, low-cost distributed data processing capabilities for more system versatility, and to provide for future growth toward the integrated office.

GSA's upcoming DP solicitation to exclude micro sales

By Andrew Mohr
Special to CW

The General Services Administration (GSA) will issue its Federal Supply Classifications Group 70, Section A schedule contract solicitation on or about March 6. In a change from past schedules, this solicitation will exclude the sale of microcomputer hardware and software.

The solicitation, commonly called the Section A schedule, is GSA's general-purpose automated data processing equipment schedule contract. It provides for the purchase, rental and maintenance of DP system configurations, control devices, input/output and storage devices, optical character recognition, analog/hybrid systems and software. The closing date for the submission of offers is April 11, 1984.

The Section A schedule is an indefinite quantity contract awarded to numerous manufacturers, distributors and dealers. GSA uses schedules to permit agencies to buy commercially available items without the delay or expense entailed in conducting a formally advertised or negotiated procurement for each purchase.

To ensure the government receives a fair deal, GSA negotiates discounts from a vendor's commercial price list before awarding a schedule to the vendor. Upon award, a schedule contractor may sell or rent its products to federal agencies and certain prime contractors working under government cost-reimbursement contracts.

GSA now manages two other DP equipment schedules in addition to the Section A schedule. These are the Section B schedule, which encompasses DP supplies and peripherals, and the newly established Section C schedule, which is devoted to micro hardware and software.

Confirming GSA's recent policy of segregating micro schedule procurement from mini and mainframe schedule procurement, GSA will exclude micro DP equipment from the Section A schedule. Micro equipment will be available only on the Section C schedule. Thus, vendors offering micro equipment in response to the Section A solicitation may have their offers rejected.

The exclusion of micros may cause problems because GSA's definition of micros remains unclear. The current Section C schedule contains equipment ranging from single-user portable computers to multiuser, multitask equipment capable of serving 64 users. GSA has indicated that DP equipment designed for an office environment will be considered to be micro equipment. However, objective criteria have not been promulgated.

Of major importance to mini and mainframe vendors, it appears that micros may continue to be sold under Section A as part of a mini or mainframe system. However, add-on sales of micros at system installations must apparently be made under the Section C schedule. This will force vendors to use both Sections A and C for serving system installations. In addition, this will result in the differing performance standards and maintenance provisions contained in Sections A and C being applied to the same type equipment at the same site.

The Section A schedule will continue to allow equipment rental. Since Section C does not provide rental, micro systems that must otherwise be sold under Section C may apparently be available for rental under Section A.

The March 6 opening date is the earliest GSA has issued the Section A schedule in years. While the early release of Section A will provide GSA more time to negotiate with bidders, it might surprise vendors expecting an April solicitation. ‡

ing batch!

The most successful first year in the history of American business.

It's true. COMPAQ® Computer Corporation had greater first-year sales than any new company in American business history.

We sold $111 million worth of our personal computers, the COMPAQ Portable and the COMPAQ PLUS™.

How did we do it?
We followed two principles.

Principle One: Offer people personal computers that simply work better. We gave them the COMPAQ Portable. It's a rugged, full-function system that runs all the most important, most useful software; literally hundreds of programs.

We followed with the COMPAQ PLUS, a high-performance version with ten megabytes of storage.

Besides being portable, both offer more capability than most other personal computers. They display text *and* graphics on the same built-in screen, to mention just one example. And they're designed to be expandable, to grow as

[illegible]

The sales figures say we did pretty well on Principle One.

Principle Two: Make it easy for people to get what they need. More than one thousand of the country's best computer dealers are now Authorized COMPAQ Computer Dealers. We back those dealers with training, service, and support to make life simpler for our users. That's one reason 98 percent said in a recent survey that they would recommend COMPAQ to a friend.

We were honored to have a history-making first year. But it's only history now. How should a company follow up the all-time best beginning?

Principle Three: Stick with Principle One and Principle Two.

For the location of your nearest Authorized Dealer, call 1-800-231-0900.

COMPAQ® is a Registered Trademark and COMPAQ PLUS™ is a Trademark of COMPAQ Computer Corporation. ©1984 COMPAQ Computer Corporation.

IBM/Stet talks spark rampant speculation

By Wilma Rodis
and Francesco Sammartino
Special to CW

ROME — Speculation is rampant here about the possibility of a telecommunications partnership between the state-owned telecommunications organization, Stet (Societa Finanziaria per le Telecommunicazioni), and IBM.

To date, both parties have held their cards close to their chests, but talks of a future collaboration on digital private telephone exchanges and data communication networks are still very much alive. Michele Principe, chief executive officer of Stet, and John Opel, chairman of IBM, reportedly reached some preliminary agreements during a recent meeting in Paris.

One of the most significant initial pacts concerns the potential establishment of a new Italian public network, known as Itapac, a packet-switching system that will eventually allow IBM's System Network Architecture (SNA) network to be directly accessed.

No network modifications

The establishment of software compatibility between the Itapac network and IBM's SNA would enable IBM installations to be connected without any modifications to the Itapac network. This compatibility could represent a significant market advantage for both partners as well as considerable savings for their respective users, as there would be no need to invest in any new interface hardware.

Other points under negotiation include:

■ That the Itapac network be 100% owned by SIP (Stet-owned telephone company).

■ The establishment of an alliance between IBM and Italtel (Stet's telecommunications manufacturing company) on the distribution of private switching equipment.

■ The sharing of IBM/Rolm Corp. telecommunications technology with Stet.

■ The establishment of direct collaboration with SGS (Stet's semiconductor manufacturing company) and an additional agreement addressing the factory automation market.

While the potential partnership may eventually pay big dividends for Stet and IBM, it could spell disaster for Italy's native company, Ing. C. Olivetti & Co. S.p.A.

Carlo de Benedetti, president of Olivetti, recently told the Italian Senate that the IBM-Stet partnership would yield negative results. He argued that the success of the Italian industrial system is contingent upon optimizing the use of national resources. Furthermore, agreements involving partners with huge technological disparity will compromise international competition, de Benedetti maintained.

Thus it remains to be seen who will be Stet's partner. After the agreement between Olivetti and AT&T [CW, Jan. 9], many industry observers considered Stet in a weakened position, but now Stet is proving to be a most attractive telecommunications partner.

Will it be IBM or Italy's own Olivetti? While the possibility of a three-party partnership cannot be excluded, it is difficult to imagine Stet changing its present course. On the other hand, Olivetti represents the only European contender in the running.

Rodis and Sammartino are reporters at Computerworld Italia, based in Milan, Italy.

Honeywell, NCR to collaborate

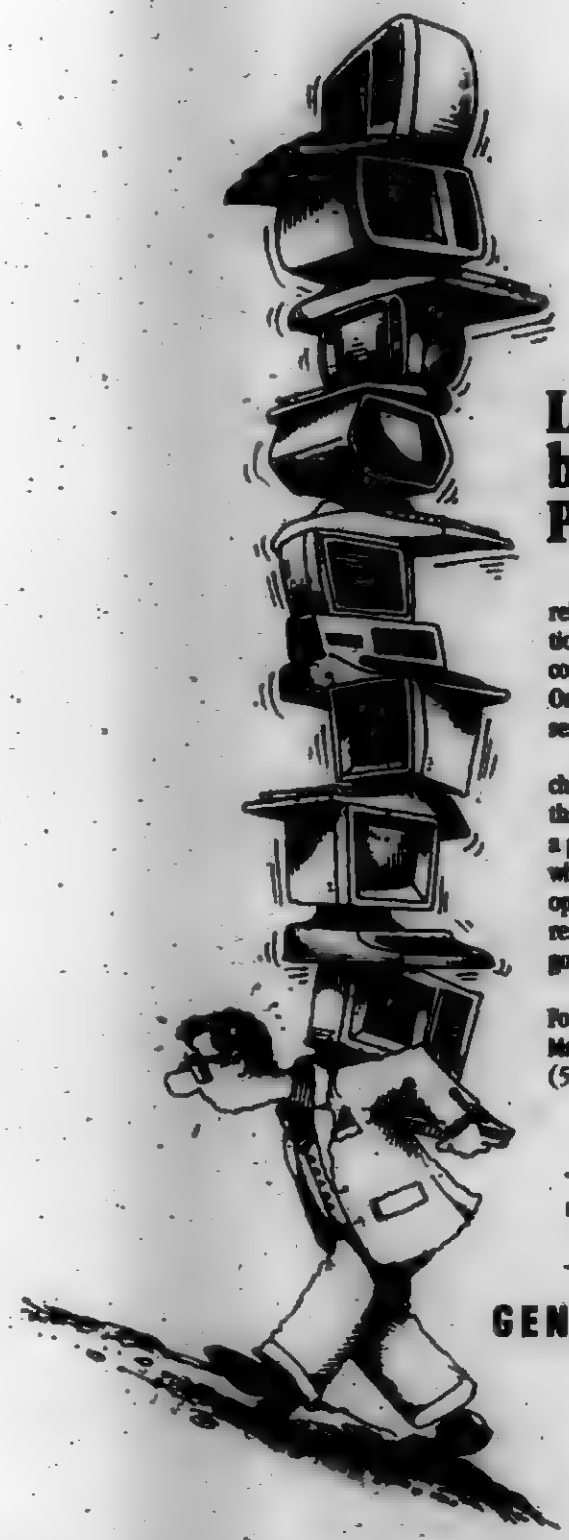
MINNEAPOLIS — Honeywell, Inc. and NCR Corp. recently announced an agreement for Honeywell to use NCR's 32-bit very large-scale integration processor chip set in the development of a planned computer system.

Additionally, the companies announced they will jointly develop a custom integrated circuit chip for use in the Honeywell system.

Honeywell said the planned system will be compatible with selected Honeywell products. James J. Renier, vice-chairman of Honeywell and president of the firm's information systems division, pointed out that the agreement "will enable us to bring new products with advanced 32-bit technology to our worldwide markets faster."

NCR's president and chief executive officer, Charles E. Exley Jr., said that the agreement with Honeywell is a milestone in efforts to market the NCR/32 chip. He stated that the chip will be manufactured at NCR's microelectronics facility, located in Colorado Springs, Colo.

NCR previously announced a computer system, the NCR 9300, built around the 32-bit chip set [CW, March 21].



Let us bear your PC burden.

General Electric now offers relief for busy managers of information systems: complete service for your company's personal business computers. On-site right where they are, or at GE service centers from coast to coast.

With GE as your service source, you choose any one of several service options that's best for you. For example, we have a program that provides you with a loaner while your PC is at our service center. If you opt for on-site contract service, we can respond fast, day or night, if something goes wrong.

So take a load off your shoulders. For more information, call Rob Rackowski, Manager—National P.C. Service Sales, (518) 385-4892.

Put GE on your PC.

Storage sites reflect radical differences

Locations vary from mine shafts to San Jose vaults

Two companies have radically different approaches to providing maximum security for their clients.

Secured Data Services, Inc. has one of the more unusual off-site storage sites for computer data. Located in an abandoned mine some 60 feet beneath the surface, the two-acre site, about 20 miles west of Dayton, Ohio, is buried under 60 to 80 feet of solid limestone.

The complex looks like something out of a James Bond movie with its high security gates, closed-circuit television and seven-inch-thick vault door. "We wanted a site that was as secure as we could make it and that was immune to natural and man-made problems," said Jim Valentine, the firm's president.

Having secured his site, Valentine added climate-control systems and brought in electricity.

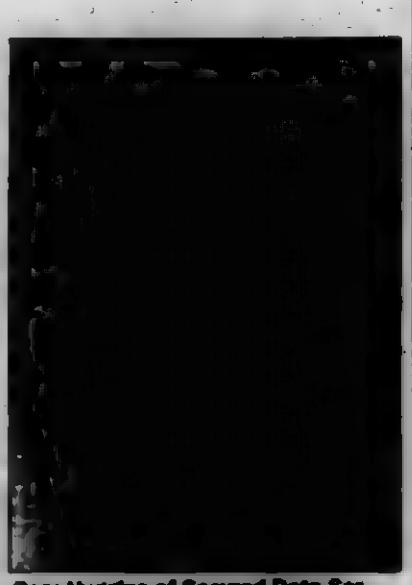
"We didn't have to worry about water, since there is a well right above our heads. And being 60 feet beneath the surface, surrounded by thick limestone walls, you also don't have to worry about anyone breaking in through the rock," he noted.

Located in San Jose in the heart of Silicon Valley, the National Safe Depository (NSD) facility takes on a quite ordinary appearance from the outside. "Our principal concern was to find a site that had good access to the main communication systems, that was not in a flood zone and at the same time was located in a good earthquake-resistant area," said Donald Rickgauer, executive vice-president and facility manager.

Surveillance cameras monitor movements inside and outside the facility, while doors, windows and walls are covered with bullet-resistant panels. The outside structure is thick concrete block, while the inside consists of a steel bank vault that is larger than many homes.

NSD President Reg Weller sees those measures as essential to providing the protection that sensitive computer data requires.

"When the on-line computers at an airline go down, it can cost that company $16,000 per minute and a big bank can lose up to $60,000 per minute," he said.



Sam Huggins of Secured Data Services, Inc. inspects one of the fire prevention units in the firm's underground media storage facility.

STORAGE from page 87

weekly or even daily basis.

The Vault Co. in Atlanta has one client with over 4,000 tapes stored at its facility. The Iron Mountain Group recorded 8,000 transactions a day in 1982, mostly in computer media.

The burgeoning nature of the data security business was further illustrated recently when Digital Equipment Corp. announced that it is making a major move into the records management and off-site storage industry [CW, Feb. 13].

For many computer users, the most pressing need is to protect their data against unpredictable catastrophes, such as earthquakes (a particular fear in the Silicon Valley), floods, fires, tornadoes and hurricanes.

A recent study by the National Fire Protection Association estimated that 70% of companies suffering a major computer room fire will go out of business.

A number of recent cases have highlighted the risks involved in not having adequate protection:

- Last August, Hurricane Alicia tore through several data processing sites in Galveston, Texas, inflicting heavy damage on the Galveston County data processing center and destroying its mainframe computer, which contained tax appraisals, payroll, accounts payable and jury selection for more than 200,000 people.
- In May 1983, a toxic chemical spill in a downtown San Francisco office building left several financial businesses without access to their records for 10 days.

In addition, publicized hacking incidents and computer theft cases have made many companies nervous. NSD recently reported the disappearance of its research and development tapes, which were stored on-site without any backup.

Such an incident could jeopardize the firm's future, NSD officials said.

Talking to the French computer world is now easier than you think...

. . . with our sister publication Le Monde Informatique.

France's rapidly growing market for computers and data processing systems is one of the largest in the world. Currently, the installed value of general purpose computer systems is more than $11.1 billion, and a tremendous continuing demand for data processing equipment will cause outside spending on computer-related equipment to increase at an annual rate of 16%, between 1981 and 1985.

When choosing new equipment and keeping up-to-date with this ever-changing industry, top systems executives will read *Le Monde Informatique*. *Le Monde Informatique* is a weekly tabloid newspaper with a uniquely targeted circulation of 22,000 copies. The circulation profile was developed by International Data Corporation, the world's leading EDP market research firm, to reach the decision-makers and buying influences at the most important DP facilities in France.

Honeywell, Bridge ink net pact

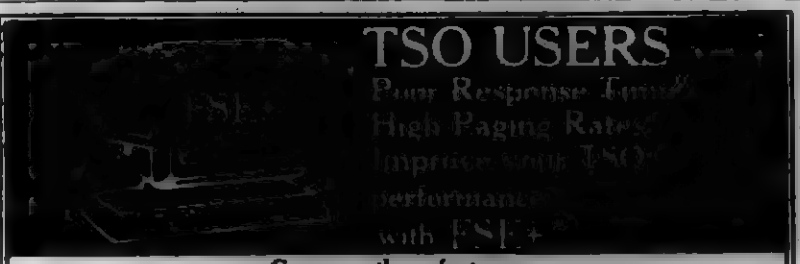
PHOENIX — Honeywell, Inc. said recently it has agreed to integrate Bridge Communications, Inc.'s local-area network product with Honeywell's distributed computer systems.

The initial product offering in the 10-year contract is a baseband, Ethernet local-area network, which will be introduced in the second quarter of 1984, Honeywell said.

Robert C. Hesser, Honeywell vice-president, said the agreement is a step toward providing customers with systems designed to integrate and transfer data, communications, video and security.

"Our long-term strategy calls for integrating private branch exchange and local-area network controllers with the full range of Honeywell computers and network processors," Hesser said.

Communications servers covered under the agreement will reportedly allow processors, terminals and professional workstations to communicate via Ethernet.



Compare these features:

- Up to 50% less overhead than SPF
- Full-Screen Editor (LRECL up to 4096)
- Data Set Manager (Controls TSO files)
- JES Sysout Previewer (Direct from JES Spool)
- File listing facility (LRECL up to 32760)
- Programmable function keys
- Split-Screen facility (Two fully-active screens)
- Customer-defined exit facility (Controls all FSE+ functions)
- FSE+ tuning parameters (Optimize performance)
- Structured menus for new users
- Command oriented for experienced users

Special limited offer for Computerworld readers only

How many micro software products do you have the time and money to examine before you buy?

Now you can look at thousands!

Introducing Data Decisions™ MICROCOMPUTERS

A unique, new, complete information service for the corporate micro buyer, featuring the industry's only independent evaluations of key software products based on "hands-on" testing by microcomputer experts in Data Decisions' own labs.

One reason for the growing popularity of microcomputers is the availability of thousands of packaged software programs. Unfortunately it's also a drawback. With so many packages to choose from, how do you find the one that's right for you?

Through actual hands-on experience. It's the only way to do it right.

But that takes time . . . costs money. Few companies can afford either. Now you don't have to spend either time or money to get the same results.

We do the "hands-on" testing

That's right. Data Decisions' own microcomputer experts do the hands-on testing for you. In our own labs . . . under controlled conditions designed to simulate the situations you'll find when you bring these products in-house.

Equally important, our experts evaluate each program, using the same fine-tuned, consistent criteria so you can compare one package against another.

The result is a comprehensive independent hands-on analysis that highlights the specific strengths and limitations of each product. You also get an exclusive line graph that shows you, at a glance, how each product measures up, on a scale of 1 to 10, with regard to operating environment, documentation, functionality, ease of use, support, system interface, vendor experience.

Available only from Data Decisions.

This independent, unique hands-on testing and evaluation of microcomputer software is available nowhere else. Only from Data Decisions.

Sure, you could do it yourself. But why would you want to when you can get complete evaluations . . . by unbiased professionals—for less than you'd pay to do it in-house or pay an outside consultant to do a similar hands-on evaluation.

That's only the beginning

This exclusive hands-on software testing and evaluation would be reason enough to subscribe to Data Decisions' MICROCOMPUTERS. Certainly these reports are worth the subscription price alone.

But you get more. Much, much more.

Look what's covered

Microcomputers—desktops . . . high-level intelligent terminals marketed as independently programmable standalones . . . multi-user Unix-type based systems . . . executive workstation/"professional" computers . . . integrated office automation workstations . . . supermicros . . . luxetops . . . portables . . . transportables . . . and more.

Expansion/extension cards—controllers . . . clocks . . . A to D converters . . . extra quad boards . . . interface boards . . . language cards . . . solid state disks . . . memory boards . . . processor enhancements . . . auxiliary processors . . . and more.

Communications—Micro LAN networks . . . micro modems . . . micro terminals . . . terminal emulators . . . micro-to-mainframe downloaders . . . database access packages . . . electronic mail . . . and more.

Peripherals—printers . . . plotters . . . monitors . . . floppies . . . hard disks . . . keyboards . . . tape drives . . . OCR . . . bar codes . . . sensors . . . power supplies . . . power source protectors . . . cooling fans . . . and more.

We do the hands-on testing for you.

You get *all this as a MICROCOMPUTERS subscriber*

Three loose-leaf volumes filled with the most complete, concise, accurate, easy-to-use, current information ever compiled on the micro marketplace . . . Consistently formatted for easy product comparisons . . . and for finding facts you need.

Hardware, Software Analyses that highlight the specific strengths and limitations and discuss product suitability for a corporate environment.

Technology Reports, Market Studies, Case Histories and Tutorials . . . on a wide range of subjects and products to help you plan appropriate courses of action.

User Ratings that let you compare your peers' opinions of products with our own expert evaluations as well as your own views.

Monthly Newsletters that highlight late-breaking industry happenings, discuss new product announcements, provide a calendar of events, and spotlight the best articles published in the microcomputer trade press the previous month—as well as a capsule version of the current month's hands-on analysis.

Unlimited Free Telephone Consulting by micro experts whose only job is to provide quick answers to your questions.

Monthly Updates, Comprehensive Surveys, Complete Vendor Directory . . . and more.

Free Bonus LANs Report

Order your trial review of Data Decisions MICROCOMPUTERS and we'll send you as a free bonus, a copy of Data Decisions' special two-part report on Local Area Networks.

The first section examines the technology and the second provides specific information on 72 commercially available LANs marketed by 59 vendors.

This report regularly sells for $39.00. But it's yours to keep—absolutely free! Just for agreeing to a no-risk trial review of Data Decisions MICROCOMPUTERS Information Service.

Save $75.00 on Charter Subscription

For a limited time, charter subscribers to MICROCOMPUTERS can save $75.00 off the regular subscription fee of $700. Order your trial review today and be eligible for this charter subscriber discount if you decide to subscribe.

No Risk Trial Offer

The only way to judge how you and your company can benefit from Data Decisions' MICROCOMPUTERS is to review it yourself. Fill out the postpaid card and mail it today. You'll receive a trial review of Data Decisions MICROCOMPUTERS. And you're under no obligation to buy anything!

We do the hands-on testing for you

Data Decisions.

29 Bruce Road/Cherry Hill, NJ 08034/800-[illegible]

☐ YES, send me your no-risk TRIAL REVIEW of Microcomputers. I am under no obligation to purchase anything and I may keep the free LANs report. Should I become a subscriber, I will be eligible for a special charter subscription price of $625—a $75 savings off the regular subscription fee of $700.

☐ Although your offer is completely risk-free, I'm still not sure. Please provide more information.

COMPUTER INDUSTRY

Speaker cites changing legal aspects of DP

By Patricia Keefe
CW Staff

NEWTON, Mass. — Advances in technology are creating a new kind of corporate arena where computer technology is being used as a sharp competitive weapon to create lasting damage to competitors quickly, according to a Harvard University Business School professor.

As a result, the legal aspects of the whole computing environment and the thrust of the issues that attorneys will have to deal with will be very different over the next 10 years from what they've had to worry about over the last 10 years, Professor F. Warren McFarland told lawyers attending the New England Computer Law Forum here last week.

McFarland told the lawyers that new technologies are:

■ Moving corporate technologies out of the "back room" and into the forefront of corporate strategic planning and execution where they will be key to a company's "ability to survive and compete."

■ Allowing companies to score greater competitive victories and creating potential for possible abuses (such as allegations that airlines that have computerized reservations systems are using them to execute unfair competitive practices).

■ Creating new regulatory issues and problems.

This has come about as a result of very short-term, but massive changes in the cost performance of technology, leading to the installation of applications that were unthinkable a few years ago, McFarland said. A shift in the actual performance of technology has occurred, he explained, involving a combination of data processing, teleprocessing, remote office support devices and microcomputer technology. Labeling the integration of these four parts as an interorganization information system, he pointed out that this has provided corporations with the ability to link their computer to those of their customers and suppliers, allowing them to manage their business relationships in very different ways.

Integral to these systems is teleprocessing capability, or electronic links which essentially facilitate "raw transfers of power changing the fundamental nature of relationships," he said.

Corporate planners will be looking at their information systems technology to determine any strategic uses, McFarland said. Defining the "generic" competitive strategy as one with low cost, product differentiation and market focus, he said that in 1984, the strategic questions are:

■ Can the strategy create definitive entry barriers?

■ Can it strengthen the customer relationship by increasing switching costs, for example?

■ Can it change the intra-industry competitive balance?

■ Can it change the basis of competition from low cost to product differentiation?

■ Can it change the nature of supplier relationship, for example, make the supplier carry the inventory cost instead of the company?

Imagine, if you could offer Distributed Printing without RJE!

You Can! With VPS the JES/3270 RJE report distribution package. Drive up to 2,000 3270 attached printers while you improve CRT response and reduce local and remote printing costs.

Check these features:

- Total RJE replacement for Batch reports, CICS spooled reports, DS Print, VM
- Operates under JES, standard routing parameters and recovery No system modifications, JES tables or additional hardware
- Shares printers, lines and network resources Reduces hardware and telecommunications costs
- Off-loads all print to JES where it belongs Improves CRT response

270 installations driving over 20,000 printers

Paradyne posts profits decline

LARGO, Fla. — Paradyne Corp. recently reported profits for the fiscal year ended Dec. 31 were down 86.4% compared to the previous year and that the company lost $1.7 million, or 8 cents per share, during the fourth quarter of 1983.

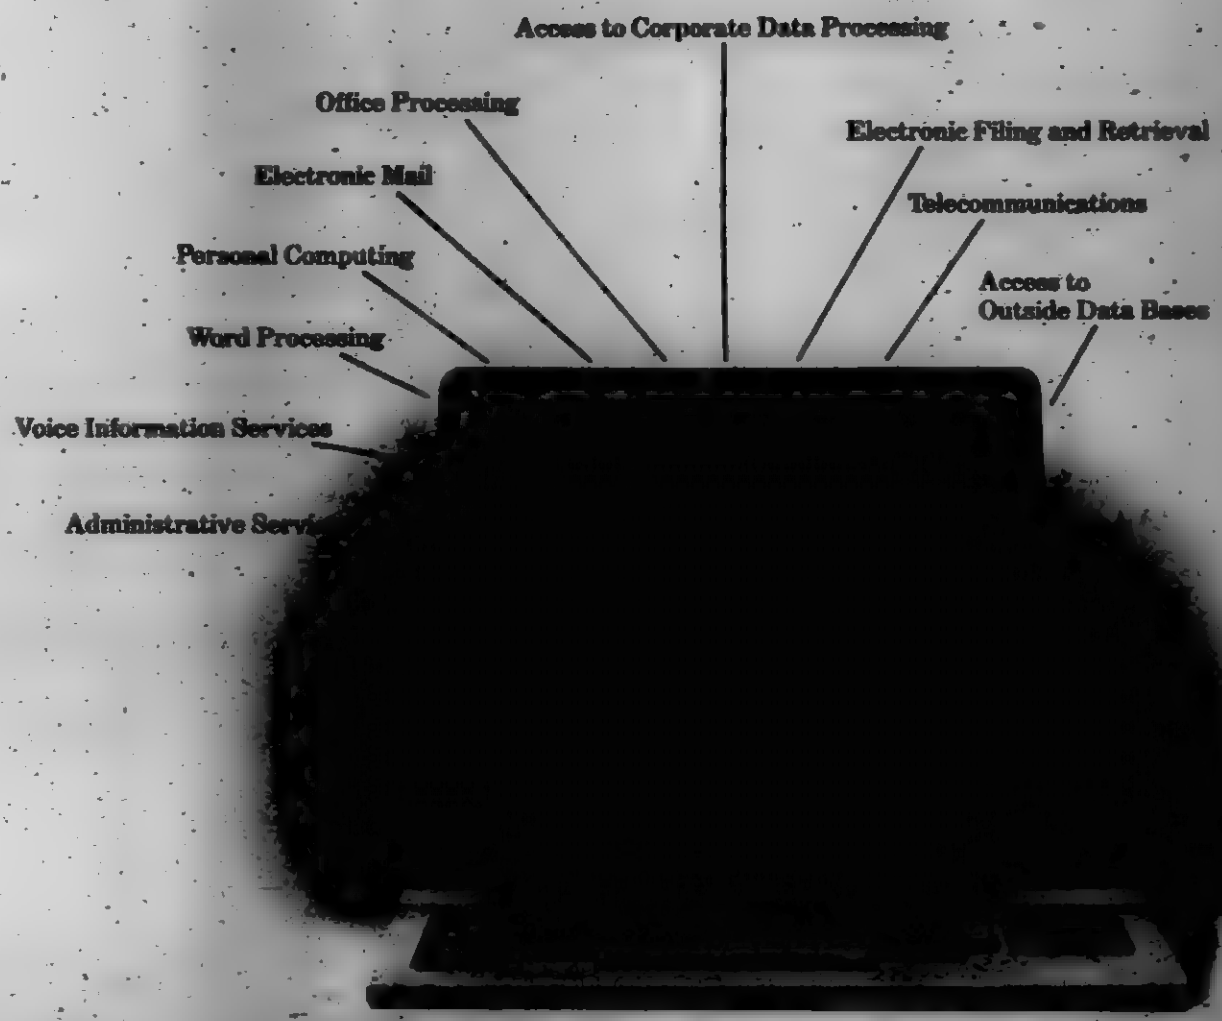
For the year, Paradyne posted profits of $3.6 million, or 16 cents per share, compared to $26.8 million, or $1.24 per share, in 1982. During 1983, revenues increased by $1.6 million to $207.3 million, just 0.78% ahead of 1982 results.

During the fourth quarter, Paradyne experienced a decline in revenues to $55.3 million, compared to $61.4 million in the comparable quarter of 1982, when the company posted profits of $7.4 million, or 33 cents per share.

The company reported that legal fees and costs paid to outside counsel were $500,000 in the fourth quarter and totaled $2.5 million for the year. Those payments reflect substantial costs incurred in defending an action brought against the company by the Securities and Exchange Commission, as well as some subsequently filed private actions and collateral matters, the company said.

Fourth-quarter expenses were increased by approximately $1 million, resulting from strengthening the firm's marketing organization, and an additional $800,000 was paid out in commissions as a result of increased sales activity, according to Paradyne. Profit margins in the fourth quarter were said to be affected by costs associated with the start-up and shipment of a new line of modems and networking diagnostic equipment.

SPERRYLINK™
OFFICE SYSTEM



Just about the only thing it won't do is brew your morning coffee.

SPERRYLINK. The one piece of equipment that can handle all your office automation needs.

It ties into the central computer for mainframe information and mainframe support.

It's a data processor when you need to handle data, a word processor when you need to handle words.

It's a personal computer for filing, retrieving, keeping your calendar, your time schedule, your memo board.

And it's a telecommunications terminal with electronic mail and digitized voice capabilities—your link to the outside world.

This is the SPERRYLINK System. A system beyond conventional ideas of office automation. Beyond words and numbers, voice and image.

It's the one system that finally brings it all together.

For more information call 800-547-8362, toll-free. Or write us. Sperry Corporation, Computer Systems, Department 100, P.O. Box 500, Blue Bell, PA 19424.

DEC, Pittsburgh Univ. renew R&D pact for VMS

By Tom Steinbeiter
Special to CW

PITTSBURGH — The University of Pittsburgh and Digital Equipment Corp. recently announced that the university will develop enhancements for the VMS operating system used on the VAX-11 series.

Under the terms of a renewed research and development relationship, the university will develop technology to allow VMS-based VAX-11 superminicomputers to communicate with other equipment using Bell Laboratories' Unix operating system, officials said. The university products will be the property of AT&T, but should help establish VMS as a compatible operating system for large networks marketed by AT&T, school officials added.

The university also will research and provide technical expertise on network maintenance and develop computer-assisted instruction software.

Winston Hindle, DEC senior vice-president, said that in exchange for this work, "Pitt will be able to purchase products at a substantial, very substantial, discount." Pitt Chancellor Wesley Posvar said that "up to $8 million worth of products from the entire DEC line will be acquired during the next three years, with special emphasis on the VAX hardware architecture."

The agreement follows by two months the Pitt-AT&T announcement of the development of a fiber optics communications network at the university. This network will provide a transportation system for voice, video and data communications for the 60-building, 131-acre campus and Pitt's regional campuses. This network will feature special communication gateways that will permit heterogeneous micros and minis to exchange data.

The Pitt-DEC agreement is an extension of a 13-year relationship between the parties. During the course of this relationship, Pitt contributed to the development of the Tops-10 operating system and the use of multiple Tri-Processors. To date, Pitt has purchased $15 million worth of DEC equipment. The university may also become a showcase for the future VAX "Venus" line and possibly for a 32-bit DEC microprocessor which is under development.

Syracuse gets advanced tech designation

SYRACUSE, N.Y. — Syracuse University was recently designated as a state- and industry-sponsored "Center for Advanced Technology" focusing on computer applications and software engineering, with major funding provided by IBM, General Electric Co. and United Technologies Corp.

The Case Center, one of seven state/government-funded technology centers around the state, is comprised of a consortium of 14 upstate New York private and public educational institutions; it has received commitments of more than $1.5 million in funds from its three major corporate backers and six other corporate sponsors. Designated under a state statute by the New York State Science and Technology Foundation, the center is immediately eligible for $135,000 in matching state funds through April 1 and for $1 million in matching state funds requested by Gov. Mario Cuomo for the fiscal year beginning April 1, according to a spokesman for the center.

Bradley J. Strait, formerly dean of Syracuse's L.C. Smith College of Engineering, resigned that position to become managing director of the center. More than 30 Syracuse faculty members and as many as 100 students are expected to participate in research projects at the center during its first year of operation, the spokesman said.

Projects will reportedly focus on three main areas: computer-enhanced reasoning, including expert systems and high-level programming languages; computer tools research, focusing on tools for hardware and software design and tools for increasing productivity; and cross-disciplinary research on the application of computer technology in various fields.

Various support facilities will be initiated, including laboratories for multiuser microprocessor development, very large-scale integration design, robotics and others, the spokesman said.

MSA introduces the shortest distance between two points. New MSA Order Processing.

MSA's remarkable new Order Processing System keeps every order on track and on schedule.

It automatically checks credit and inventory availability. Schedules shipping. Bills customers. Immediately throws a red flag if there's a problem.

Then resumes the process when the problem is resolved.

It's the perfect way to keep your customers satisfied.

Now they won't have to wait while your customer service representative keys in line after line of information. The system automatically displays addresses, preferred shipment and other order-related information.

It also instantly checks current credit records, saving your service representative that time-consuming task.

Customer inquiries are a snap with MSA's

COMPUTER INDUSTRY

Opel criticizes national industrial policy proposal

PHILADELPHIA — John Opel, chairman of IBM, recently spoke out against proposals for a U.S. national industrial policy and said efforts should be directed at reducing the increasing federal budget deficits and dealing with unemployment, productivity and educational issues.

"The argument for a national industrial policy not only originates in an assertion of a problem that we do not have — the problem of massive dehumanization — it also fails to confront the genuine problems we do have," problems with deficits, productivity, unemployment and education, Opel said at the University of Pennsylvania.

Advocates of a national industrial policy would create a tripartite national industrial policy board with power to intervene in the economy and a national development bank with remedial plans to protect declining industries.

Four assertions

Opel disagreed with four assertions that the advocates make: the U.S. is deindustrializing; its market system cannot meet subsidized world competition; deindustrialization is causing mass unemployment; and the technical revolution will leave workers as technical wizards or unemployed.

"There are four problems crucial to our economic health and competitiveness: deficits, inadequate productivity growth, hard-core unemployment and a deterioration in our educational system," according to Opel.

To solve the problems of deficits and inadequate productivity growth, he urged that the federal deficit be cut, foreign trading partners open their markets, companies strive to be low-cost producers and tax reform be implemented to encourage saving and capital investments.

Opel categorized unemployed workers into two groups: displaced and disadvantaged. He recommended government incentives for individuals who move to areas of industrial growth and companies that move to disadvantaged areas. Disadvantaged workers must become functionally literate and acquire marketable skills, he said.

"Finally, we must overhaul our obsolescent school system and restore its capacity to produce graduates who can, at a minimum, do math and read and write English," Opel maintained.

MERGERS AND ACQUISITIONS

AGS Computers, Inc. has announced its acquisition of Software Design Associates, Inc. for $12.7 million. The acquisition will see Software Design's management continuing in its present capacity. A privately held company, Software Design generated $20 million in revenues last year, compared with AGS' $142 million.

■

David C. Evans, president and chief executive officer of Evans and Sutherland Computer Corp., a Salt Lake City-based special-purpose computer manufacturer, has announced that the company has invested $3 million for a controlling interest in Cardamation, Inc., of Boulder, Colo., a producer of customizable software for computer-aided design.

■

Grumman Data Systems Corp. has agreed to acquire Cbee, Inc., a McLean, Va. computer software and systems engineering firm. Terms of the cash sale were not available.

■

Esprit Systems, Inc., Melville, N.Y., has announced an agreement in principle to acquire Perceon Data Corp. of Dallas, a manufacturer of hardware and software for local-area networks.

■

Control Data Corp. has acquired one million shares of preferred stock, convertible into 40% of the common stock of Financial Information Systems, Inc. In addition, CDC will make available a line of credit of up to $1 million to Financial Information Systems.

■

Online Computer Library Center (OCLC) has acquired Avatar Systems, Inc. of Potomac, Md. Avatar will become a subsidiary of OCLC known as the OCLC Washington Office.

system. It lets you review the status of orders, prices, credit or inventory availability at a moment's notice. You can change orders easily.

And the system is flexible enough to handle special requests for shipping vendors, packaging, delivery dates or special handling procedures.

Just as important, MSA's online realtime system helps you control internal costs. It moves orders along without costly error or duplication of effort. It provides current information on pricing, discounts and special sales agreements with individual customers.

And it's a powerful tool for controlling inventory, since you can conveniently check on inventory status daily.

You'll find MSA's new Order Processing System flexible and easy to use. It works with the MSA Manufacturing System to let you schedule production more efficiently. And promise ship dates to customers more confidently. Of course, it's also perfectly integrated with MSA's Financial System.

If your company is ready for a dramatic improvement in your order processing, contact Robert Carpenter at (404) 239-2000. Or write Management Science America, Inc., 3445 Peachtree Road, N.E., Atlanta, Georgia 30326.

EXECUTIVE CHANGES

David L. Dodge has been promoted to president of Datasery Equipment, Inc.

■

Gunder Bostrom has been named president of Ericsson Communications. He recently served as vice-president of the Business Systems Division, an Ericsson Information subsidiary based in Sweden.

■

Charles A. Mathews, formerly a senior executive with Britain's Plessey Group, has joined Cipher Data Products, Inc. as president, chief operating officer and member of the board of directors.

■

Gary E. Sharpe has been appointed president and chief executive officer of Delphax Systems of Toronto.

■

David S. Krueger has been appointed president and chief executive officer at Three Phoenix Co.

■

Joseph W. Kavaly has been elected president of RCA Cylix Communications Network, Inc. He had been vice-president of finance for RCA Communications, Inc.

■

Ronald P. Bernier, former vice-president of domestic field operations for Tymnet, Inc., a subsidiary of Tymshare, Inc., has been named president and chief executive officer of Health Systems International.

■

John Thomas has been named president of Telecom Plus of Florida, a unit of Telecom Plus International, Inc.

■

Jay Callanan has been promoted to president of Information Unlimited Software (IUS), the micro software division of Computer Associates International, Inc. Also promoted at IUS were Mark Farnell, senior vice-president, marketing and sales; Richard Bond, vice-president, sales; and Sharon Anderson, vice-president, customer services and training.

■

Lewis A. Burgins has been promoted to senior vice-president of operations at Microcom, Inc.

■

Northern Telecom, Inc. has appointed three new vice-presidents and general managers. They are W.J. Vivians, Cook Electric Division; A.G. Lutz, DMS-100/200 Division; and Paul Warun, Data Test Systems Division.

■

P. Michael Sandiola, former senior vice-president for Exo Systems Corp., has joined Oracle Corp. as vice-president, marketing and sales.

■

Lawrence M. DeVere has been appointed vice-president, law and administration, at Communications Satellite Corp.'s Comsat World Systems Division.

■

Michael L. Grubbs has been appointed vice-president, corporate development, and Nick Leonetto has been named vice-president, product research and development, at Alays, Inc.

■

William J. Seager has been named vice-president of sales for Facit, Inc.'s Data Products Division.

■

John C. Kingsley has been appointed senior vice-president, finance, at Raytheon Data Systems, a division of the Raytheon Co.

■

Thomas W. Miller has been promoted to executive vice-president, corporate marketing, at Control Data Corp.

■

Peter T. Gresham has been appointed vice-president, finance, and chief financial officer of Sage Systems, Inc.

■

Merle H. Banta has been elected president, chairman of the board and chief executive officer of AM International, Inc. The company is currently operating in a Chapter 11 proceeding.

■

Ronald W. Braniff has been appointed president of Ask Computer Systems, Inc. Sandra Kurtzig, founder and former president of Ask, continues as chief executive officer and chairman of the board.

■

Gale R. Aguilar has been appointed vice-president, corporate development and strategy at Prime Computer, Inc.

When Computerworld delivers the goods on manufacturing systems this March 26th, you'll definitely want to be there.

Ad deadline is March 9th.

In response to the increasingly heavy involvement of DP/MIS people in computer-aided manufacturing (CAM) and computer-aided engineering (CAE), *Computerworld* is preparing a Special Report that focuses on CAM/CAE, manufacturing resources planning (MRP), robotics, inventory and shop floor control.

We'll also cover the effect these new technologies are having on traditional manufacturing operations. And on the delicate relationships between traditional DP departments and the factory automation specialists.

If you act before March 9th — your products or services can be represented. To reserve space in this issue, call one of the sales offices listed below or call Ed Marecki, National Sales Director at (617) 879-0700.

To: Ed Marecki, National Sales Director

SUPERMICROS

Technology and Business Communications, Inc. has announced the third edition of *The S. Klein Directory of Computer Graphics Suppliers: Hardware, Software, Systems and Services.* The directory identifies more than 500 supply sources and contains basic product information and business background on each company, including ownership, company size and sales volume. The directory sells for $60, with a special prepublication price of $47 prior to April 20 (prepaid). More information is available from Directory Manager, Computer Graphics Suppliers, Third Edition, 730 Boston Post Road, P.O. Box 80, Sudbury, Mass. 01776.

■

Contel Mobilcom, Inc., a newly formed subsidiary of Continental Telecom, Inc., has reached agreement with 22 other telephone companies to provide cellular mobile telephone services in several U.S. cities through partnership arrangements. Following Federal Communications Commission approval, Contel Mobilcom will be the controlling general partner in limited partnerships that will provide the service in Norfolk and Richmond, Va.; Mobile, Ala.; Fresno, Calif.; and El Paso, Texas.

■

SR Computers, Inc., manufacturers of Avatar universal terminal converters and PA1000 protocol converters, has changed its name to Avatar Technologies, Inc. The firm has also moved to larger quarters at 99 South St., Hopkinton, Mass. 01748.

■

Hewlett-Packard Co. and Revel, Inc. have signed a research and development contract aimed at developing data base software for HP computers.

■

Applied Digital Data Systems, Inc. (Adds) has acquired the Autograph X series of graphics terminals from Datatype, Inc. of Mountain View, Calif. Adds' Display Product Division will have responsibility for the new product line.

■

Five schools in each of 26 school districts, including 23 districts with the largest enrollments in the country, will receive up to 15 IBM Personal Computers or PCjr systems and accompanying software as part of a $12 million computer literacy program recently announced by IBM. The program follows a similar program established by IBM last year in 80 secondary schools in California, Florida and New York. The expanded program will include elementary and secondary schools and will provide training courses for teachers involved in the program.

■

ROBOTS from page 86

spection after assembly, and plant capacity is limited by availability of trained labor. The new company estimates that, by 1985, demand for hard disks will grow to 12 million units, and typical plant output will have to skyrocket from 600 to 5,000 units per day to meet it. This means that only automated manufacturers will be able to compete profitably. Autobotics is clearly targeting that particular electronic assembly market.

Intelledex is a 1981 start-up which developed an integrated-vision robot designed for assembling microelectronics components such as magnetic disk-reading heads and silicon wafers. This company already received $5.25 million in two rounds of venture capital financing from the top high-technology investment banking firm of Hambrecht & Quist. Intelledex is estimating sales of about $2 million in 1983 and is clearly shaping up as the next robotics firm that may go public.

Automatix, Inc., which went public last March, has increased its revenues by over 100% during the third quarter of this year and is clearly another robotics firm of interest to the institutional investors who are rapidly acquiring its shares for their portfolios and who already own 12% of the outstanding stock. The company produces robot systems with vision although it does not confine its market to electronic assembly applications. Object Recognition Systems and Robotic Vision Systems are two other public companies with vision-equipped robots that may also compete in the electronic markets.

Anorad, Control Automation, Microbot and Precision Robots are some of the still-private firms developing robots aimed at electronic components handling that are competing in this game, but the most interesting competitors are within the electronics industry itself.

IBM, already in factory automation robotics, presents a huge potential. Lesser known but also important in the industry is GCA Corp., which is a major semiconductor manufacturing equipment producer already developing specialized robots for the industry. But not to worry. Even if some of the newcomers do not make it on their own, they're bound to be snapped up by the big electronics firms once they start automating their operations to keep up with the fast-stepping Japanese.

COMPUTER NETWORKS AND INTERNATIONAL STANDARDS

Computer Network Technology has finally come of age, evolving from infancy to a clearly defined art. However, with this evolution there is no need for dilemma.

Now the Educational Services Division of R. L. Roper Consultants introduces a course which provides you the necessary information to make decisions about communications structure. Moreover, this course clearly defines standards which, although not relevant in most areas of information processing, are critical to the communications arena.

This 2-day seminar is designed for those responsible for, or involved in, planning corporate network activities, as well as for those implementing networks on an international or large scale level.

Among the topics to be discussed are:

- Structure of Networks
- Network Topology and Implementation
- ISO Reference Model for Open System Interconnection
- CCITT International Standards and Recommendations
- Existing Proprietary Architectures

Seminars are presented on-site and publicly in French, as well as in English.

Please send the coupon below for additional information.

5¢ BRIEFS AND BYTES

Endata, Inc. has reported revenues for 1983 of $36.4 million, compared with $31.9 million for 1982, and net income of $2.8 million, or 60 cents per share, up 53.2% over 1982's net income.

■

Tymeplex, Inc. has announced revised earnings of 17 cents per share for the second quarter of fiscal 1984 ended Dec. 31, a reduction of 1 cent per share from the figure announced on Jan. 17. According to the company, the change was due to an error in computing the per-share figures.

■

Columbia Data Products, Inc. announced that net sales for the fourth quarter rose to $30.4 million compared to $4.3 million last year. Net income increased to $2.5 million or 21 cents per share for the period, compared to $374,000, or 4 cents per share, in the fourth quarter of 1982. Full-year 1983 net sales increased to $56.2 million from $9.4 million last year. Net income rose to $3.6 million, or 32 cents per share, compared to $269,000, or three cents per share, in the prior year.

■

Wyly Corp., whose principal operating subsidiary is University Computing Co., has reported revenues of $152.9 million up from $140.5 million in 1982. Income was $190,000, or 1 cent per share, compared with $4.1 million, or 30 cents per share, for 1982. According to the company, the increase is from its software operations in December.

■

Eagle Computer, Inc. has announced sales for the second quarter of fiscal 1984 of $19.1 million, a 34% increase over the prior quarter and a 300% increase in sales over second quarter fiscal 1983. Net earnings for the quarter were $457,000, compared with $81,000 for the prior quarter and $17,000 for second quarter fiscal 1983.

■

Computervision Corp. has reported fourth-quarter revenues of $111 million and net income of $10.6 million, up 37% and 45%, respectively, from fourth quarter last year. Revenues for the year rose to $400 million from $325.2 million in 1982. Net income in 1983 was $35.3 million, or $1.24 per share, compared with $32.4 million, or $1.18 per share, for 1982.

■

Information General Corp. has reported revenues of $197.9 million and net income of $8.5 million, or $1.67 per share, for fiscal year 1983, compared with revenues of $170 million and net income of $5.4 million, or $1.49 per share, for 1982.

■

Communications Corp. of America has reported a net loss of $462,902, or 11 cents per share, on revenues of $16.8 million compared with net income of $496,157, or 14 cents per share, for the comparable period last year. The six months ended Dec. 31 showed a net loss of $849,113, or 20 cents per share, on revenues of $32.1 million, compared with net income of $906,342, or 27 cents per share, on revenues of $26.9 million for the same period last year.

■

Syntrex, Inc. has reported revenues of $11 million for the first quarter of fiscal 1984, a 61% increase over the comparable period in fiscal 1983. Net income for the period was $1 million, or 12 cents per share, compared with a $790,338, or 9 cents per share, loss for the first period last year.

■

Phoenix American, Inc., a financial services company, which organizes and manages computer leasing limited partnerships, has reported revenues for the second quarter, ended Dec. 31, of $8.5 million, a 40% increase over the same period last year. Net income for the quarter was $2.1 million, or 25 cents per share, up 41% over the comparable quarter from last year.

■

Tandon Corp. has reported sales of $93 million and earnings of $9.2 million for first quarter, fiscal 1984, up 71% and 63%, respectively, over the comparable period last year.

Tymshare posts net loss for '83

CUPERTINO, Calif. — Tymshare, Inc. recently reported a net loss in fiscal year 1983 of $1.5 million, or 13 cents per share, reduced by favorable tax benefits from a total loss for the year of $6.6 million. The previous fiscal year, the company had posted profits of $8.8 million, or 73 cents per share.

During the fourth quarter, the company experienced a loss of $3.5 million that was reduced by tax benefits to a net loss of $1.4 million, or 12 cents per share. In the corresponding period of fiscal year 1982, the company had experienced a total loss of $6 million, reduced by tax benefits to a net loss of $2.3 million, or 19 cents per share.

Revenues for the just-ended fiscal year were down 3% from the previous year to $288.6 million. For the fourth quarter, revenues were up 9% over the year-earlier figure to $71.4 million. However, during 1983 the company divested its medical services and bank card processing businesses, which if accounted in 1982 would have produced comparable revenues of $271 million.

ANNOUNCING A DIGITAL CONSULTING ASSOCIATES SEMINAR:

WHY YOU SHOULD ATTEND
You can't afford to miss this important seminar, taught by Chris Date whose book "An Introduction to Database Systems: Volume I" is the standard text on the subject and has sold well over 150,000 copies.

By attending this seminar you will have the rare opportunity to hear about the latest developments in database technology from the individual who has been acknowledged as one of the world's foremost experts on the subject. According to Dr. George Schussel, "Chris Date is an industry phenomenon. Not only are his books the most widely used DBMS textbooks anywhere, but he is also the most highly respected and widely attended instructor on Relational Databases."

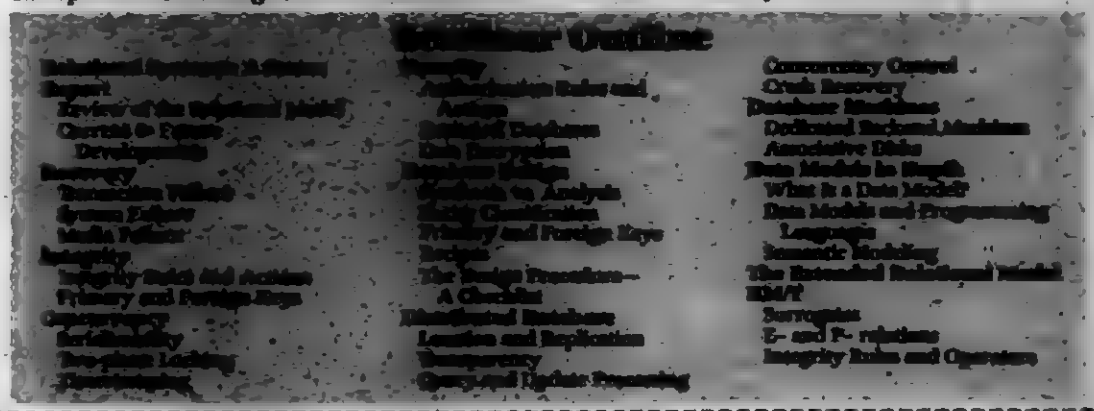
This seminar will bridge the gap between database concepts and daily practical database use. It presents examples and solutions to a number of familiar problems, such as concurrency control, authorization, and database design. Systems based on the relational model will be stressed.

This seminar is intended for DP managers • database specialists (including • database administrators • database designers • and • database applications programmers) • DP students • teachers • end-users or • DP professionals who wish to broaden their understanding of what is involved in relational and database technology.

Chris Date is one of the fundamental contributors to database theory and one of the most widely read and best known author/lecturers in the field. He has developed *Database: Technical Developments* based on his recent book "An Introduction to Database Systems: Volume II." Chris Date is renowned for his ability to communicate complex technical subjects in a clear and concise fashion.

TOPICS
Recovery • Database Design • Integrity • Semantic Modeling • Concurrency • Distributed Databases • Security • Database Machines

Seminar Outline



Concurrency Control
Crash Recovery
Database Machines
Dedicated Relational Machines
Associative Disks
Data Models in Depth
What Is a Data Model?
Data Models and Programming Languages
Semantic Modeling
The Extended Relational Model RM/T
Surrogates
E- and P- relations
Integrity Rules and Operators

KRAUT from page 87

service organization and say, 'Hey, you guys take a look at the line and the modems and the terminals and you fix the problem.' "

Competing with established third-party maintenance companies such as Sorbus, Inc. and TRW Corp., Honeywell "is on the fringes of the top six" and believes it can grow in that area based on "a proven field force with a national logistics organization," Kraut said, adding that Digital Equipment Corp. and NCR Corp. have made similar but more limited efforts to enter the field.

Honeywell is attempting to capitalize on the organization it built to service Honeywell equipment, including 250 offices, more than 1,000 points of supply for parts and a force of some 2,200 service engineers throughout the U.S. and abroad.

The company last year implemented a Remote Support Facility in Atlanta, through which engineers at Technical Assistance Centers here in Newton and in Phoenix may dial into customer systems and remotely diagnose problems.

Those facilities are provided to customers with Honeywell and non-Honeywell equipment through a Totalcare Third-Party Service program that can include training, on-site support, remote support and other services tailored to a customer's needs, Kraut said.

That service reflects the relative increased expense of sending engineers out on service calls while hardware costs in general are declining. "An hour's worth of travel time is worth an hour's worth of maintenance," Kraut said.

While the company is "more oriented to the business world than to the home market," Honeywell recently announced an agreement to provide warranty and nonwarranty service to buyers of Coleco Industries, Inc.'s Adam home computer system and is planning to open by the end of the present quarter a total of 35 walk-in service centers to provide service to customers of Coleco and other vendors.

Kraut said the refocused service effort is managed by a team of entrepreneurs who are encouraged to take risks.

Currently, existing resources are being utilized, but "as they grow the business and need more resources they will get them," he said.

IBM from page 87

System/36, current System/26 and System/38, he said.

"One of IBM's great preoccupations in the small business world is to lock people into a migration path," Jeffery said, and the announcement of a System/34-compatible micro would go a long way toward satisfying that objective.

Word of an impending Personal Computer/34 introduction has also reached Chris Herron, president of Fusion Products International, Inc., a Larkspur, Calif.-based supplier of productivity enhancement software packages for IBM's small business systems.

'Real hummer'

"Everything that we've heard thus far about [the theorized micro] leads us to believe that it's going to be a real hummer," Herron said.

"It's supposedly going to be source-level compatible with the System/34, will probably come with a hard disk module and is expected to replace the entire bottom end of the System/34 product line," he said.

Moreover, he added, "the PC/34 is definitely going to happen and will be announced momentarily, probably during the first or second quarter of this year."

Different view

Not everyone, however, shares Herron's confidence. "I'd be very surprised if IBM introduced a Personal Computer that runs System/34 software," David Stein, Gartner Group, Inc. cofounder and executive vice-president, said recently during a telephone interview.

"The company would probably be very careful not to announce a low-cost System/34-like product until it had persuaded most of its customers to move upward to the System/36," he said.

On the other hand, Stein does concede the possibility that IBM may be planning soon to add an entry-level model to its System/36 processor line.

"I haven't heard any rumors as such about an upcoming System/36 announcement," he said.

But a low-end extension to that product line would be in full accord with IBM's long-term hardware strategy, which is "to migrate current users of the System/34 to the System/36 and ultimately to the System/38," he added.

Upward move

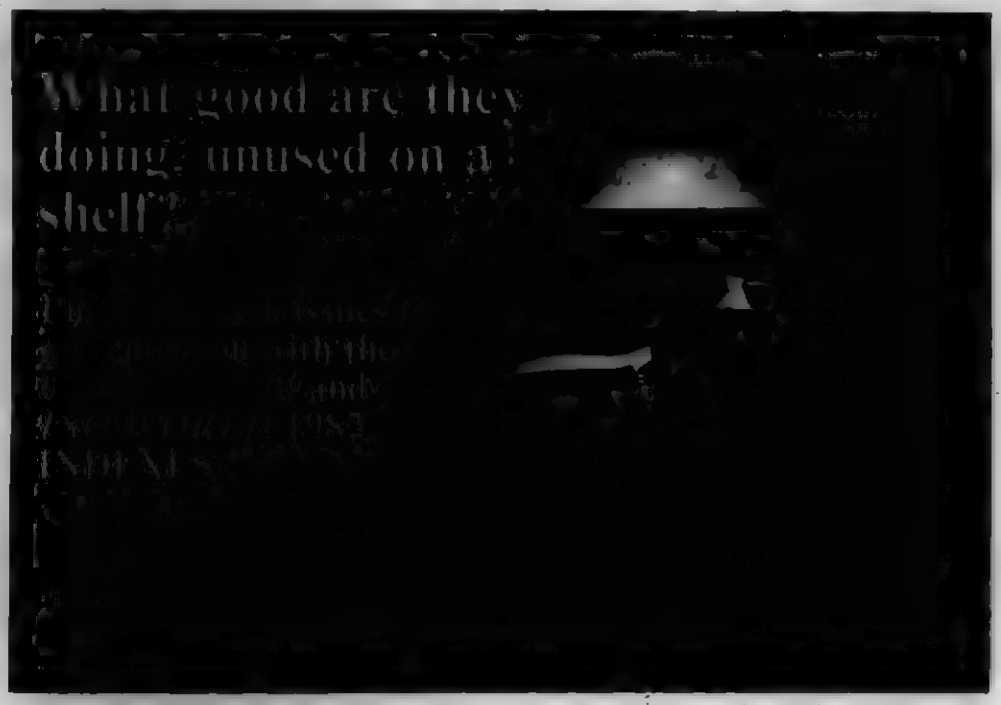
Another industry observer, Minneapolis-based computing consultant Tom Teresi, foresees the near-term future of the System/36 series somewhat differently from Stein.

"I don't see how IBM could make the product line much smaller [than it is right now] without crippling its performance," the president of Tom Teresi, Inc. said recently over the phone.

"The System/36 already overlaps the System/34 in both power and capacity," he said.

Rather than extend the System/36 downward, IBM is likely to move its Personal Computer family upward with the introduction of a multiuser micro that outperforms the Personal Computer XT, he said.

In addition to his full-time consulting work, Teresi serves as System/36 project leader for IBM's Chicago-based Common Users' group.



You'll get great material for reports, back-up material for purchase decisions, resource material for contracts, research results for long and short-range planning — in other words — a terrific reference library at your fingertips when you use one of our Indexes to access all the information that's stored in your back issues of *Computerworld*, *ISO WORLD*, and *Computer Business News*.

With the *Computerworld* Index, you get an easy reference (including page numbers and issue dates) to all the information that's packed into all 58 (including *Extra!* and *Computerworld 04*) 1982 issues — 2,636 pages of news, stories, In-Depths, Special Reports, interviews, applications stories, features and tutorials on everything from APPS to Zenith.

And in the *ISO WORLD* Index, you'll find entries from 3 issues of *ISO WORLD* and from 36 issues of *Computer Business News* — 913 pages of industry news and trends, features, new product announcements, marketing and distribution articles, perspectives, columns, and analyses, on everything from AB Dick to Zentec.

Whatever you're doing professionally — Changing systems and procedures, purchasing new equipment, drawing up a contract, doing salary reviews, looking for dealers, setting up a local area network, there'll be articles in back issues of *Computerworld* or *ISO WORLD* to help you. From government regulations, to current trends; from the phases and stances of an individual product to the pitfalls of OEM contracts — you've already got lots of professional research sitting on your shelf. Let the *Computerworld* Index or the *ISO WORLD* Index help you find it when you need it.

Take a look at just a few of the hundreds of entries listed in the *Computerworld* and *ISO WORLD* Indexes:

Index	Heading	# Entries
CW	Local Area Nets	70
CW	Microcomputers	81
CW	Graphics Systems	136
CW	Accounting Systems	101
CW	Disk Equipment	126
ISO	Dealers/Distributors	64
ISO	IBM-PC	84
ISO	Floppy Disks	51
ISO	Modems	45
CBN/ISO	Retail Stores	53

And that's a sample of just this year. We also have Indexes for *Computerworld* that go all the way back to 1976 and Indexes for CBN back to the first — (Nov. 1978-Dec. 1979)

If you don't have all the back issues of *Computerworld* and *ISO WORLD* that you need to get the articles you want, you can order back copies for the an entire year on 35mm microform from University Microfilm, Int., Periodical Entry Dept., 300 North Zeeb Road, Ann Arbor, MI 48106 —at very reasonable rates. Or you can simply take advantage of their reprint service for individual articles.

To get your Index, just fill out the coupon in this ad and send it with your check to Indexes/Marilyn Prisuta, Box 880, Framingham, MA 01701.

Year	Index	Price	Quantity	Total $
1982	Computerworld	$ 39.00		
1981	Computerworld	$ 35.00		
1980	Computerworld	$ 30.00		
1979	Computerworld	$ 25.00		
1978	Computerworld	$ 20.00		
All Computerworld Indexes for last five years (1978-1982)		$100.00		
1982	ISO WORLD	$ 39.00		
1981-1978	CBN	$ 60.00		

Add $1.25 shipping and handling for one book and 75¢ for each additional book. If your check is enclosed, we pay shipping costs.

You can advertise your product in 40 computer publications in 25 foreign countries—with one phone call.

There's a market for your product abroad.
You can reach the right people in the major computer markets throughout the world. The people who make the buying decisions—in countries already importing more than $3 billion in computer hardware, software and supplies.

CW International Marketing Services gives you one, efficient source for direct contact with the leading local computer publications in the world's major computer markets. How can we do this for you? We have a wide network of editorial offices around the world and provide first hand marketing information to our clients. Plus, we have over 10 years experience in the publishing industry.

We're a division of CW Communications/Inc., publishers of *Computerworld* and the world's largest publisher of computer-related newspapers and magazines.

CW International Marketing Services makes it easy.
We'll translate your ads for you and give you production services to meet the specifications of any or all the newspapers and magazines we publish or represent—and—we'll even bill you in dollars. What's more, when you place your advertising through CWIMS, you save the V.A.T. (value-added tax). It's as easy as advertising in your local publications.

We'll even help you with market facts, and, in the case of the People's Republic of China, we can arrange for you to give product and marketing seminars there! You can run your ads in our periodicals in these countries:

*Argentina	*Denmark	*Italy	*Norway	*Saudi Arabia	*Sweden
*Australia	Finland	*Japan	*People's	South Africa	*The Netherlands
*Brazil	*France	Korea	Republic of	*Southeast Asia	*United Kingdom
Chile	Greece	*Mexico	China	*Spain	*West Germany
	India		Peru		

*Published or co-published by CW Communications/Inc.

For more information on how we can help you promote your product all over the world, send us the coupon below or call Diana La Muraglia toll-free at (800) 343-6474 or telex #95-1153. In Massachusetts, call (617) 879-0700.

POSITION ANNOUNCEMENTS

amdahl

Peak Performance

People come first at Amdahl. Top quality people who thrive on working with the world's fastest, most reliable computers. From the beginning Amdahl has invested time, care and effort in supporting and motivating quality people. Reach your peak performance by exploring these opportunities in our Coporate Computer Center, one of the largest data centers in the country.

UTS System Programmer

Install and maintain the UTS systems (Amdahl's version of UNIX running under VM). You'll consult with internal users and interface with Amdahl's UTS development group on testing and enhancements. BS/MS in computer science required, with UNIX and C programming experience. Knowledge of VM and some background in operating system support a plus.

MVS Performance and Tuning Specialist

Requires 2 to 4 years C.P.E. experience including performance management, monitoring, configuration analysis, application analysis and operating system changes. Working knowledge of SAS, Assembler and OS/MVS system internals required.

Lead IMS System Programmer

Requires a minimum of three years IMS systems programming experience with knowledge of IMS DB/DC internals, SMP, and strong diagnostic skills. Project leadership skill and interest a must.

When you join Amdahl's progressive Corporate Computer Center in Sunnyvale, California, you will enjoy these advantages reserved for the most select team in large-scale systems:

- Leading-edge software including MVS/SP, ACF/NCP, ACF/VTAM and MSNF, VM/SP, IMS/DB/DC.
- A hardware configuration that consists of two 5860s, eight 470/V8s, five 4705s mass storage system, over 400 spindles of DASD and over 1,000 terminals.
- An extensive training and education program.

To explore one of these opportunities, call Bob Tyler TOLL FREE at (800) 538-9460, ext. 5190. In California call COLLECT (408)746-6190, or send your resume to his attention at Amdahl Corporation, MS-300, Dept. 3-003, P.O. Box 3470, Sunnyvale, California, 94088. We are an equal opportunity employer through affirmative action.

Data Processing

IBM Training Specialists

As one of the world's largest information services companies, Computer Sciences Corporation has taken a solid leadership position in the development of technically advanced software systems.

At the Systems International Division of CSC, located in Herndon, Virginia, our continued growth in the development of sophisticated turnkey systems for foreign governments has created immediate requirements for IBM training specialists.

Selected individuals will provide course curriculum development of software-related training materials. In addition, the individuals will provide classroom instruction of foreign expatriate students on the utilization of the IBM 43XX system.

Qualifications include a BS degree in Computer Science or related field coupled with a minimum of three years training experience encompassing computer programming applications, IBM mainframe (370 or larger) systems, course development and directly applicable teaching experience. You should have direct experience in at least two of the following subject areas: COBOL, DOS/VSE, DOS/JCL, CICS/VS, DATACOM DB.

To learn more about these exciting opportunities, our excellent salaries and comprehensive company-paid benefits, please call/forward your resume in confidence to Paul Gorey, Manager, Professional Staffing, on (703) 471-3206/7.

Seven NEW Reasons to Choose Beatrice for your DATA PROCESSING Career

Beatrice Foods Co. is a fast growing, $9.2 billion multi-national, diversified success story and a leader in Corporate MIS. Two very good reasons we're among the top names in Data Processing.

And, now we have seven NEW reasons to join Beatrice today:

1. A NEW Commitment

Our new long-range corporate plans call for aggressive growth and a strong emphasis on Corporate MIS and data processing services.

2. NEW Facilities

Our commitment shows in our brand-new, ultra-modern Corporate Data Center, designed with the data processing professional's needs in mind.

3. NEW IBM Hardware

We're currently utilizing a large-scale IBM 308X mainframe with an extensive network of individual IBM Personal Computers and compatibles.

4. NEW Software and Applications

The decisions on new systems, software and applications are being made right now! It is a great opportunity to break new ground.

5. NEW Computer Workstations

Each office in the Data Center is equipped with the newest in ergonomically-designed furniture to eliminate "computer fatigue."

6. Extraordinary NEW Potential

A management-oriented career path, strong projections for continued growth and a promotion-from-within policy combine to offer you excellent potential for career advancement.

7. Excellent NEW Opportunities!

BUSINESS SYSTEMS ANALYSTS

Develops applications for Corporate MIS including:

- Decision Support Systems
- Financial Accounting/Analysis
- Purchasing and Distribution Systems
- Marketing Information Systems
- Cash Management Applications
- Tax Reporting Systems
- Human Resources Systems

Required experience:

- Systems Development
- COBOL, PL/1 or FORTRAN
- Fourth Generation languages (ie. EXPRESS)
- Functional familiarity with applications previously mentioned
- MBA preferred

DATABASE ANALYSTS

- Supports Systems Development
- Systems Review Board Participation
- Prepare/Maintain Corporate Data Dictionary
- Design Distributed Databases
- New Software Package Evaluation
- Production Environment Maintenance
- PC Technology Integration
- Design Security for 13 Gigabyte Database

Required experience:

- Relational Database Design
- Third and Fourth Generation languages
- MVS/OS and VM/CMS
- Various Hardware environments

TRAINING SPECIALISTS

- Develops Systems Analysis Training Programs
- Performs Skills Assessments for Corporate MIS
- Executive and PC training
- Assists in end-user training
- Coordinates training materials with outside vendors

Required experience:

- Systems Development
- Data Processing
- Systems Training (lecture, workshop, CAI/CMI) and materials/programs
- Concepts/Skills Training and Mastery Testing

OFFICE SYSTEMS ANALYSTS

- Analyzes Office Systems & Applications
- Assists implementation of automation plan, operating instructions and manuals
- Trains users

Required experience:

- Three plus years in developing automation goals
- System implementation
- User training
- Electronic mail, calendaring, word/record processing and/or communications preferred

TECHNICAL SERVICES ANALYSTS

- Installs/Maintains Operating Systems Software
- Tests/Evaluates Software Products
- Hardware/Software Planning
- Monitors Resource Utilization

Required experience:

- Four years large scale IBM Multi-CPU environment
- MVS and/or VM Operating Systems
- Data Transmission Technologies
- IBM-PC; Lotus-1,2,3; WORDSTAR

Please send your resume or brief letter outlining experience to:

EASTERN

Eastern Airlines has the following programmer openings at its Miami Computer Center:

IBM 30xx SYSTEM SOFTWARE PROGRAMMERS

Requires one year experience with generation, internals, troubleshooting, and/or maintenance of one or more of the following: MVS - JESS - TCAM - VTAM - NCP - CICS - IMS/DB. These are system programming positions and require assembler language background. (Position JK1)

IBM 30xx INFORMATION CENTER TECHNICAL SUPPORT PROGRAMMERS

Requires experience using one or more of the following software products: MARK IV - TSO - SAS - FORTRAN. These positions assist end users in developing programs and systems. (Position JK2)

UNIVAC 1100 SYSTEM SOFTWARE PROGRAMMERS

Requires one year experience with generation, internals, troubleshooting, and/or maintenance of one or more of the following: OS1100 - TIP - DMS1100 - CMS1100 - TELCON. These are system programming positions and require assembler language background. (Position CC1)

IBM CICS APPLICATIONS PROGRAMMERS

Requires an AS or BS degree in Computer Sciences or Management Information Systems plus 2 years experience in Command Level CICS programming using COBOL and DL/1. (Position WL1)

UNIVAC 1100 APPLICATIONS PROGRAMMERS

Requires an AS or BS degree in Computer Sciences or Management Information Systems plus 2 years experience in COBOL programming. (Position WL2)

DATABASE ADMINISTRATION POSITIONS

Requires one year experience supporting databases in CICS-DL/1 or IMS-DB/DC environments. Experience must include use of IMS utilities, database recovery/reorganization and COBOL programming. (Position LR1)

PL1 PROGRAMMER

Requires minimum two years PL1 experience in an OS/MVS environment with JCL. (Position TO3)

COBOL PROGRAMMER

Requires minimum 2 years COBOL PROGRAMMING experience in an IBM environment with JCL. (Position TO3)

Working for Eastern Airlines can open up a new world for you. As an employee, you, your spouse, children, and parents can fly anywhere Eastern flies (South America, the Caribbean, the West coast, etc.) for a current charge of only $6.00 plus tax. With nearly 39,000 employees in our system, we offer tremendous career opportunities.

In applying for any of these positions, please refer to the specific position code letters in parenthesis at the end of each position description. Send detailed resume, including salary history and requirements to:

An Equal Opportunity Employer M/F.

Computer Professionals

JOIN US IN SOUTHERN DELAWARE-

Where Spring Begins Earlier And Summer Lasts Longer!

First Delaware Services (subsidiary of First Maryland Bancorp), a diversified financial service computer support group, began its operations in Milleboro, Delaware three years ago. We're pleased with this location, just 20 minutes from the Southern Delaware shoreline-for many reasons. Among them are the variety of affordable lifestyles and recreational opportunities and increased purchasing power due to no state sales tax!

Examine the career opportunities, excellent compensation, and benefits (including FULLY-PAID RELOCATION) offered by our growing organization, and you could be working in a location where you'd love to live-by EARLY SPRING! Due to the rapid expansion we've been anticipating, we have immediate openings for professionals with LARGE-SCALE IBM equipment experience, to begin with us in the following positions:

SYSTEMS ANALYST

Minimum of 5 years experience in an IBM shop. The successful candidate must possess excellent verbal and written communication skills and be experienced in project planning and control analysis on large scale IBM systems. Proficiency in flow charting, writing program specification and directing user/technical personnel on all levels required. CICS, IMS, TSO, SPF experience is preferred.

SENIOR PROGRAMMER/ANALYST

Requires minimum of 4 years COBOL programming on large scale IBM systems. Proficiency in problem resolution, JCL creation, and debugging techniques required. Must be knowledgeable in sub-system design and specification writing.

COMPUTER OPERATORS

2-3 years experience on a 3083 IBM OS MVS operating system. Some JCL experience preferred. Minimum 2 years college required.

We believe that time off should be relaxing and work-time should be rewarding. If you share this philosophy, you will fully enjoy the projects and the location. LET'S TALK! Call or send resume to D. Jill Connolly, P.O. Box 1596, Baltimore, MD 21203. Phone: (301) 244-4041

Experienced Programmer/Analysts

CALL US...

We'll Help You Grow

M.I.S. International is Michigan's largest software services corporation supplying data processing professionals to Midwest area companies. In addition, AUTOFLEX, Inc., a subsidiary of M.I.S., is heavily involved in the design and development of Robotics equipment and software systems.

If you have at least one year of experience in any of the following disciplines and desire a high tech, state-of-the-art environment, call Personnel Recruitment or forward your resume.

- IMS DB/DC with COBOL or PL/1
- CICS with COBOL or PL/1, DOS/OS

Headquartered in Rochester, New York, we have all the cultural and educational advantages of a large metropolitan area as well as the ambience and scenic beauty of a small, relaxed town. Our new Office Systems Group is located in lovely northern Virginian Fairfax County just minutes away from our nation's capitol.

CCI currently has immediate opportunities for:

GROUP LEADERS/SOFTWARE ENGINEERS

You'll be responsible for the design and implementation of data base applications and utilities, or fault-tolerant operating system development including development of a multiprocessor UNIX-compatible transaction processing system.

We prefer a technical degree plus a minimum of 2 years' experience. Knowledge of C, UNIX, and data structures plus experience with data bases in a minicomputer Real Time or on-line environment and/or OS internals are also desired. U.S. citizenship or permanent residence is a must.

**UNIX is a trademark of Bell Labs*

We offer opportunities for growth plus attractive compensation and benefits including relocation.

For immediate confidential consideration, please forward your resume including salary history to the location of interest to you.

PROGRAMMER/ANALYSTS

WE CAN KEEP YOUR COMPUTER SKILLS CURRENT!

With technology advancing and changing at such a rapid pace, are you concerned that your computer skills may be out-of-date? Over the last decade, the environment has changed from DOS to OS, from batch to online, from sequential to database, and from mainframe to distributed networks. Which environment is more marketable?

At AmeriTrust, we have changed with the times and, in many cases, before the times. Our current environment features two Amdahl V7 computers, one IBM 3081 that drive our Assist and point-of-sale networks throughout the country. We operate under OS/MVS, use CICS for our onlines, and IDMS is our corporate database. Other software/hardware includes TSO/SPF, SAS, Wang systems, IBM PC's — we even have a division that sells computers!

Our current needs are the following:

Programmer/Analysts

We seek an individual with 1-3 years experience in a large scale IBM-OS environment using Cobol. Database and online experience is preferred. We are not looking for maintenance programmers but individuals who can contribute in a major project setting.

CPCS Specialist

A major project team is being formed and needs an individual versed in CPCS check-processing software. Being the #2 man on the team, the person would be the major technical resource for the design and implementation. Familiarity with the Vector packages a plus. We are looking for a person diverse enough to move into other areas at the completion of the project.

Contact AmeriTrust today. Discover our excellent salaries and benefits and give your career greater challenge in a progressive, state-of-the-art atmosphere.

Please feel free to send your confidential resume or call:

An Equal Opportunity Employer M/F

At Control Data, success has many directions for the . . .

Achiever in State-of-the-Art Software Development

The following key positions are located at the Arden Hills, Minnesota (a suburb of Minneapolis/St. Paul) operation that is dedicated to the design and development of large mainframe computers and software.

Software Consultant - Tools & Technology
You will be a self-directed person, capable of working effectively between several technical and management levels. You will serve as the technologist for software metrics projects and coordinate the design and development of process metrics with the development of software tools. Your knowledge of the software development process, applied statistics and data bases is a must. An advanced degree in computer science, applied math or engineering is required plus 6 years of applicable experience. #100205

Principal Programming Analyst - Tools & Technology
Your responsibilities will include the leadership and design direction for compiler code generation and optimization for an advanced PASCAL based language with multiple code generation. You will be called upon to utilize your experience in code generation techniques and project leadership. A BSCS degree or equivalent is required plus 6 years of experience. #75181

Principal Programmer Analyst - Communication Software
You will be working on the internal design, development, test and implementation of an advanced communications product. Experience in communications/networks and the ISO-OSI Model is desired. Familiarity with PASCAL, NOS/NHP/CCP, X.25 packet switching, SNA or IBM 3270 protocol is a plus. Requires a BSCS or BSEE and 6 years of experience. #91879

Programmer Analyst - Network Software
You will be a key member in the design, code, test, and support of the VAX RHF product software for the Loosely Coupled Network. Background in VAX/VMS is desirable. Familiarity with FORTRAN and VAX MACRO a plus. Prefer two or more years experience in data communications and local networks plus an applicable degree. #78364

Development Analyst - Network Software
You will be a key member of a Software team for the Loosely Coupled Network IBM interface. Requires ability to design and implement software for OS/VS2, MVS system in assembly language. Will also train, install, enhance and provide some software maintenance. Data communications background preferable, but not required. Degree and minimum of five years experience required. #91148

As a Control Data employee, you will participate in one of the finest and most complete benefit programs available in the industry today including competitive relocation benefits.

If you are interested in one of the positions described above, please send your resume and salary requirements along with the number at the end of the description to:

NATIONAL BUREAU OF STANDARDS
INSTITUTE FOR COMPUTER SCIENCES AND TECHNOLOGY

OPPORTUNITIES FOR CHALLENGING POSITIONS IN COMPUTER SCIENCE AND TECHNOLOGY

COMPUTER SCIENTISTS AND PROGRAMMERS needed for:

- perform laboratory studies of high-level network protocols (transmit and satellite networks, computer-based office systems protocols, and local area network protocols (CSMA and token access methods);
- perform advanced research in computer network technology including advanced network architecture design, network operating systems, and protocol design techniques;
- participate in national and international technical committees to develop networking standards; and
- design protocols using finite state machine methods.

Desirable experience include protocol design, implementation and testing, an understanding of operating system principles, use of block structured programming languages, and work with technical committees. An undergraduate degree which consisted of 60 semester hours in mathematics, statistics and computer science and included differential and integral calculus courses is required in addition to at least three (3) years of experience in the computer science field.

For the research positions, desirable experience also includes research in advanced development of network protocols/software, data communication technologies, and protocol design. A Ph.D. in computer science or a related field is preferred.

These positions range from the GS-12 to GS-15 grade levels depending upon qualifications and experience and offer competitive salary, excellent career benefits and promotional growth opportunities. Please send your Personal Qualifications Statement (SF-171) to:

U.S. Department of Commerce
National Bureau of Standards
Administration Building, Room A-153
Washington, D.C. 20234

Attn: Ms. Josephine White (C3640)

The National Bureau of Standards is located in modern facilities in Gaithersburg, Maryland, and is an Equal Opportunity/Affirmative Action Employer. U.S. Citizenship is required.

WASHBURN UNIVERSITY

MATHEMATICS AND INFORMATION SCIENCES DEPARTMENT: Faculty position. Instructor/Assistant/Associate Professor for tenure-track position open Fall semester 1984. Minimum of a Master's degree (PhD preferred) in Information Systems, Computer Science, or closely related fields with expertise in most of the following areas: Systems Analysis and Design, Data Communications/Networking, COBOL, Data Base, and Operating Systems. Other qualifications include the ability to revise curriculum offerings to stay abreast of commercial and industrial needs in systems analysis and design; a strong commitment to quality teaching at the undergraduate level; and previous college teaching and some industrial or commercial experience is preferred. Responsibilities: Teach 12 hours in Information Systems per semester, assist in the development of new courses and programs, and share in the usual university advising and committee activities. Salary is competitive depending on qualifications and experience. Application deadline is April 15, 1984. Send vita, graduate transcripts, and the names of 3 references to: Alvey J. Barker, Chairman, Search Committee, Mathematics and Information Sciences Department, Washburn University, Topeka, KS 66621. Washburn University is an equal opportunity/affirmative action employer.

tangent

tangent international is a well-established multi-national consultancy with offices in New York, Dallas, Orlando, London, England and Doha, Qatar. Tangent operates the largest international FOCUS consultancy, as a major divisional activity.

This area of our business is expanding rapidly, and we urgently need to recruit additional FOCUS consultants on either a permanent or independent basis.

We require indepth FOCUS knowlege with good experience of database design, internals and optimization techniques. Candidates with similar exposure in either RAMIS or NOMAD will be considered as internal retraining is provided.

tangent offers you the opportunity to join a growing organization that provides planned career growth, varied and interesting assignments and for those who like to travel, work locations across the United States.

We are also looking for individuals with IDMS, IMS and CICS expertise for our Professional Services Division.

tangent offers an attractive compensation package which includes:

- Excellent rates of pay
- Paid relocation
- Full medical benefits
- 15 days paid vacation

For an informal discussion about your new career with **tangent** in the United States…call: PHILL CLARK, (212) 938-0438…or write to…TANGENT INTERNATIONAL COMPUTER CONSULTANTS, Inc., One World Trade Center, Suite 8007, New York, N.Y. 10048.

We are an equal opportunity employer.
Agency responses will not be acknowledged.

SUCCESS IN THE SOFTWARE WORLD **tangent**

SENIOR PROGRAMMER ANALYST

Brockway, Inc., a Fortune 500 manufacturer of glass, plastic and metal containers, offers excellent opportunity to individuals experienced in defining, designing and implementing manufacturing and business systems.

Developing and meeting project schedules to produce quality systems requires at least 5 years applications development experience, including 2 or more years in systems analysis. A BS in a related field is equally important, and experience with MVS, TSO/SPF, CICS, IDMS and related products, plus selection and installation of vendor-developed software, would be helpful.

We offer a competitive salary, comprehensive benefits and ample opportunities to reach your full potential. For prompt attention, please send your confidential resume including salary requirements to:

BUY - SELL - SWAP

Will the real lessor please stand up!

Who do you want to deal with during your computer lease?

An investor? An insurance company? A consortium of banks? Or your leasing company!

As computer experts, we understand your individual equipment requirements. Hartford Computer Group doesn't sell your leased equipment to an investor who will not understand or care about your requirements.

When you sign a lease with Hartford Computer Group, you deal only with us. We maintain complete ownership and control of your leased equipment and can therefore give you the *flexibility* you want in a computer lease. We can do this only by refusing to participate in tax-advantaged leasebacks that give investors control over your leased equipment. Tax-advantaged leases allow for little or no flexibility!

We give you Hartford Computer Group. Want to lease computer equipment? Want to upgrade your computer equipment, renew your lease, or change your leased system completely? With no outside investors or participants to inhibit your transaction, Hartford Computer Group is free to offer the ultimate flexibility in customer service.

You deal with one company, before and after the lease begins, the real lessor...Hartford Computer Group!

Your questions about our unique computer leasing program are answered in our brochure. Write or call for your copy.

CURIOUS ABOUT CLASSIFIED?

If you are interested in advertising with Computerworld, but don't know how to do it, give us a call! We will be glad to send you our current rate card, which explains sizes, costs, deadlines and requirements. Along with that, we can send a demo paper which actually shows examples of ad sizes, typefaces, and prices. All you have to do is ask! Our toll free number is 800-343-6474, in Massachusetts call (617)879-0700, just ask for the Classified Advertising Department. Or, you can look for our classified order form located in the classified section of Computerworld. Fill it out, attach your ad with a check, and return it to us. Computerworld Classified Advertising, 375 Cochituate Rd., Box 880, Framingham, MA 01701. We're anxious to help!

Get a clear picture on all your leasing needs.

With all the high-tech equipment available, making a decision about what's right for your company isn't always easy.

That's why Greyhound Computer Corporation works with you to make those decisions. Whether you want to lease or purchase, we'll work with you to customize your equipment requirements. And we'll also work with you to customize a financing schedule that meets your financial requirements.

We've been leasing, servicing, refurbishing, maintaining and providing financing for computer and other equipment for over 20 years.

So if you have questions regarding your equipment-leasing system, call Greyhound Computer Corporation. We'll make the picture perfectly clear.

HOW TO SAVE $30,000 PER MONTH ON A 3083 LEASE.

Lease the same 3083 that IBM leases for over $92,000 per month from Randolph—for less than $62,000 per month. That adds up to savings of $1,440,000 over a four-year lease period. If you're renting an older machine, Randolph may save you even more—and you'll get about four times the throughput in the bargain.

WHEN IS THE BEST TIME TO TALK TO RANDOLPH ABOUT LEASING A 3083?

Now—because Randolph has 3083's available for 4th quarter delivery. But it's never too late, even if you already have a machine installed. Whatever your situation, we can tailor a lease that will fit your exact needs and let you start saving money right away.

TALK TO RANDOLPH NOW.

We can solve problems like these, and more . . .

Stuck with a lease on your old machine?
We'll sublease it, and provide a new lease on a 3083.

Own a 3083 but need cash?
Sell your machine to Randolph, and we'll lease it back to you.

Machine installed on a rental basis?
We'll show you how to end the lease and install a new 3083. Any termination charges can be folded into your new Randolph 3083 lease.

LEASING COMPUTERS IS OUR ONLY BUSINESS.

At Randolph, our people have an average of 18 years in the DP industry . . . from 360's to 3081's. They know all about alternative financing to be sure, but they also know their way around a DP department and the hardware in it.

WE LEASE MORE THAN 3083's.

Whatever your needs, now is the time to talk to Randolph. We provide leases for IBM 303X, 4300 and 3081 systems and peripherals—disks, tapes—as well as 3083's.

UNIQUE FINANCIAL STABILITY.

We're an important part of one of the nation's oldest and leading financial institutions . . . The First National Bank of Boston. 19 years in computer leasing gives added assurance that Randolph will continue as the leader in the computer leasing industry . . . continue to live up to the terms and conditions of our agreements . . . provide upgrades . . . fulfill all of our commitments.

LET RANDOLPH HELP YOU SAVE $30,000 PER MONTH.

We can solve a lot of problems for you, and save you money, too. Talk to Randolph now . . . call Joseph B. Kelly, Jr., Executive Vice President, 800-243-5307.

More Bulletin Board on the next page.

THE BULLETIN BOARD

A Low-Cost Way to Sell Hardware and Software in Computerworld.

What is The Bulletin Board?

It's a classified section in Computerworld designed especially for the selling and buying of individual pieces of hardware in a convenient, low-cost format. It is especially suited to companies that have a piece of used equipment they want to sell. For one low price, you can inform more than half a million Computerworld readers around the country of your equipment's availability.

How Does The Bulletin Board Work?

Bulletin Board ads come in standard units (one column wide by one inch deep) and standard typefaces. (Units may be combined to produce deeper ads, but one column is the maximum width and no units of less than one inch are available.) Ads are arranged under headings (such as "IBM", "DEC" or "Printers"). The headline of the ad is set in larger, bold type, and should contain the standard equipment identification. The body copy should describe the equipment very briefly and give the person to contact. This is all the information an interested buyer needs to follow up. No ad should have more than one piece of equipment or software.

The price for each standard unit is only $130.00. There is a one unit minimum and no fractional units available.) Anyone can place an ad, but no agency commissions are paid, no quantity discounts allowed, and no credit toward rate is given for contract advertisers who advertise in other sections of Computerworld. It's a simple and effective system for buying and selling hardware and software.

How to Place an Ad in the Bulletin Board.

Ads are accepted in the mail, by phone or by telecopier. Ads can be accepted up until the Monday before issue (7 days in advance of issue date). You should write out your ad before submitting it. (The standard size will hold approximately 25 words of copy.)

Once you've written your ad, send it in with the coupon or call one of our ad-takers. (If your company has never advertised with us before we request a check with your order.)

Remember that all ads are standard. No special typefaces, no borders and no logos are allowed. Ads are set on a six-column page in our classifed section under the heading "The Bulletin Board.". We assume no liability for errors beyond the price of the ad in the case of material errors.

ORDER FORM

COMPUTERWORLD BULLETIN BOARD

Issue Dates: Ads can be accepted up until the Monday preceding the issue desired. Computerworld comes out every Monday.

Classifications: Most ads will be classified according to the brand of equipment that is being bought or sold. These classifications include Burroughs, Data General, Digital/DEC, Hewlett Packard, Honeywell, IBM, NCR, Sperry Univac, Salvage, Terminals, Misc. Systems and Miscellaneous.

Copy: Copy sent in via the mail or telecopier (telecopier extensions are 410 and 451) should be clearly typewritten. Ads may be given over the phone to our team of ad takers. The standard size is 1 column by 1 inch deep. These units may be combined to form larger sized ads. Describe the equipment very briefly, give the price and the name of the person to contact. All ads will be set up using a standard format. No borders or logos are allowed.

Cost: The price for each standard unit is $130.00 (One unit minimum and no fractional units allowed.) There are no agency commissions and no quantity discounts.

Billing: Once you've written your ad, send (or call) it in with your name and address for billing purposes and we'll run it. (If your company has never advertised with us before, we request a check with your order.)

SOFTWARE FOR SALE

IBM 38 users...

For a tighter grip on MRP...

RMS/38 provides the tight-fisted control of a closed-loop MRP II system that allows direct user access to all stored information. Its sophisticated query facility lets you generate user reports. And advanced data base architecture makes expansion simple and economical. RMS/38 even offers a PC link that lets you transfer information to your IBM Personal Computer for interaction with popular micro products.

grab hold of RMS/38

Only RMS/38 has 15 powerful applications to provide you with total control over manufacturing, distribution and finances. **Contact PCR, Professional Computer Resources, 2021 Midwest Road, Oak Brook, IL 60521** (near Chicago). Also in New York, San Francisco and Los Angeles.

IF YOU WANT THE BEST APPLICATIONS DEVELOPMENT TOOL, TALK TO THE PEOPLE WHO DEVELOP THE BEST APPLICATIONS.

Of all the applications development tools ever designed, only one has the proven success of our new Millennium SDT.

Because Millennium SDT was designed by McCormack & Dodge, a company with over a decade of proven success developing applications. Business applications used in over thirty countries. By the world's biggest and most demanding corporate clients.

M & D design teams have developed everything from accounts payable to payroll/personnel software. Recently, they've won industry acclaim for developing the only family of systems on the market with a genuinely borderless environment. The Millennium series.

What made the Millennium series possible was our discovery of Millennium SDT, a remarkable tool based on a remarkable truth: eighty percent of the functions in all applications are, in fact, generic. Which means that 80% are reusable.

This discovery allowed us to vastly simplify and accelerate our entire systems development process. Tasks that once took months suddenly took days. And we were able to bring a breakthrough product line to the marketplace well ahead of our competition.

If Millennium SDT revolutionized our systems development process, think of what it can do for yours. You'll make more efficient use of your data processing resources than you ever thought possible.

And just to give you an idea of how fast our applications development tool works, we've included your first application in this ad. All you do is find the dotted lines, fill in the requested information, mail the completed form, and wait for the postman to bring a packet of important information. And, if you're in a real hurry, call 1-800-343-0325.

Soon your backlog will begin to disappear. You'll be a Millennium ahead.

START WITH THIS APPLICATION.

Amdahl unleashes 3380 alternative

By Robert Gelt
CW West Coast Bureau

SUNNYVALE, Calif. — Users searching for an alternative to IBM's 3380 storage device were given a boost last week when Amdahl Corp. announced two additions to its 6000 series disk drives.

The 6380, a direct-access storage device, is manufactured by Fujitsu Ltd. and is based on the Japanese manufacturer's new Eagle 2 head disk assembly technique.

Amdahl announced two 6380 models: the Model AA4, which incorporates the firm's 6880-G2 storage control unit, and the Model B4, which is a slave disk drive. The 6380 can store up to 2.5G bytes of data on four head disk assembly units. One Model AA4 can accommodate three Model B4 units for a total capacity of 10G bytes, the vendor said.

The 6380 is said to offer 15% more performance per dollar than its IBM rival, with twice as many actuators per 1G byte. In addition, with an average seek time of 15 msec, the 6380 is said to give a 7% faster response time than the IBM product. The IBM 3380 Model AA4 has a storage capacity of 2.56G bytes, can transfer data at rates up to 3M byte/sec and costs $96,640. Aqdahl's 6380 Model AA4 costs $81,300.

In other developments involving Amdahl:

■ *Fujitsu Ltd. dramatically increased its stake in Amdahl, giving it what observers believe is de facto control of the American company. Page 5.*

■ *Amdahl announced attached and dual-processor versions of its 5860 CPU. Page 6.*

Designed for systems that process sequential, large block-size applications, the 6380, like the smaller 6280, works with the Amdahl 470 and 580 series and compatible mainframes. It runs under IBM's MVS and VM operating systems and supports IBM's Airline Control Program in Extended Architecture environments. The unit supports other system software that operates with 3380-format devices, the vendor said.

The 6380 contains a feature called Dynamic Extended Pathing which, according to Amdahl officials, improves throughput and channel use by allowing for two transfer paths to the data. This, the vendor said, means that if access to data is interrupted because of a channel, storage director or controller malfunction, the disk enclosures in the string are still accessible through the second controller-director-channel path. The 6380 has a data transfer rate of 3M byte/sec.

The DXP feature is also said to provide the interface for dynamic path selection and support for dynamic reconnection when operating in IBM 370 XA environments.

The 6280 stores data in four sealed disk

Applications execs paid most

By James Connolly
CW Staff

WILLOW GROVE, Pa. — The highest paid systems and data processing employees in the U.S. in 1983 were applications programming managers, with average salaries of $38,700, according to a survey conducted by the Administrative Management Society based here.

Applications programming managers' salaries rose 7.5% over 1982 figures, helping those managers to surpass software systems programming managers, whose average salaries rose 5.8% to $38,200 from the 1982 high of $36,100.

The survey of 2,585 companies, with 60,218 systems and processing employees in 108 U.S. and Canadian cities, showed that the lowest U.S. salaries were in the West Central U.S., an area ranging from Wisconsin to Kansas. The Eastern U.S., the East Central U.S. area from Ohio to Illinois and the Western U.S. tended to have the highest salaries, according to the report.

The second annual AMS survey showed that software systems programming managers led the salary field in Canada with an average of $42,200 (Canadian) for a 9% gain, followed by applications programming managers at $41,200, up 7.3%.

The 44-page report covered 20 positions in computer operations, data entry operations, software systems programming and data base management and their salaries as of Sept. 16.

'Riser congestion': a cabling nightmare

By John Gix
CW Staff

Take a glance at the back of any mainframe computer, and you will come face to face with the wire Hydra that is to blame for the cabling nightmares many companies are experiencing.

Installing wire or cable to support new or relocated computer equipment on multiple floors within an organization is growing increasingly difficult because the space in the vertical cable shafts, or risers, in some buildings is becoming scarce.

Bill Orlando of MPL Systems, a data communications consulting firm in Wayne, N.J., said that the vertical risers in more than 50% of the buildings he encounters are nearly filled to capacity.

Part of the problem stems from old wire and cable left in place when no longer in use, from the frequent relocation of equipment and from the rapid growth in the number of terminals and other end-user devices being installed.

Another factor contributing to riser congestion is that when users isolate an equipment malfunction as cable-related, it is usually impractical — given the lack of wiring documentation and the labor involved — to track the problem down and fix it, Orlando said. Instead, a new cable is pulled.

To remove the need to go into the vertical risers to wire for new or moved equipment, Orlando often recommends that an organization centraline its terminal controllers on a floor that is roughly in the middle of its building. These controllers are then at-

Vendor pulls application generator out of beta test

By Paul Gillin
CW Staff

MINNEAPOLIS — End users just may not be ready to develop their own applications, something Analysts International Corp. found out the hard way.

The consulting and programming service company recently announced that it has pulled its Corvet application generator out of beta testing after deciding that "additional features and testing would enhance the marketability of the product."

The decision, which company officials said would force Analysts International to show a loss in 1984, was made after beta-site experience showed that the company had erred in identifying the final audience for the tool. "We found that although users were influencing the sales cycle, it was programmer/analysts rather than systems analysts who would use it," said Victor Benda, executive vice-president of Analysts International. "This was unexpected."

Announced last May (CW, May 9), Corvet was billed as an IBM mainframe-based application generator that would "enable nonprogrammers to develop full production applications without intervention from the management information systems staff until the final stages." The product made extensive use of menus and prompts to guide the user through data definition, I/O and screen design. "We were trying to construct a product that was a next step [in application development]," Benda said.

However, the feedback the company received from the initial beta site indicated that the product was being used mostly by professional programmers. "We found most comments were programming-related," he said. "Some were almost phrased in Cobol terms."

Faced with the risk of creating user dissatisfaction, Analysts International decided to withdraw Corvet, "try to back down a little and compromise with the technical people," Benda said. Among the steps the company has taken are reducing some table-handling features and adding facilities for writing Cobol routines within Corvet applications. Analysts International has also contracted with a larger company site for its next beta-test stage.

Corvet-related expenses will force Analysts International to show a loss in 1984, although revenues could exceed the record $27.6 million earned in 1983, officials said. Rumblings about the beta-test difficulties initiated a slide in Analysts International stock on the over-the-counter market from $12.75 on Jan. 18 to $7 at the end of last month.

Benda said Analysts International has not altered its commitment to Corvet and that a new version will be available sometime in the second half of 1984. "The words are still good about the product, but maybe we took too dramatic a step," he said.

MSA inks agreement with NCR

ATLANTA — Management Science America, Inc. (MSA) last week announced an agreement with NCR Corp. which will make four major MSA applications available on NCR mainframes by early next year.

The announcement is MSA's third in the last two years with a major hardware supplier. In addition to the IBM mainframe market, the company also offers applications on Honeywell, Inc. and Sperry Corp. mainframes.

The latest agreement provides for NCR to modify and adapt current MSA software and future enhancements to run in the NCR environment, an MSA spokesman said. The companies will share responsibility for various other development, marketing and support activities.

MSA software will be made available for NCR 8500 and 8600 series mainframes under NCR's VRX operating system. The initial on-line applications to be ported to the new hardware include MSA's general ledger, payroll/personnel, accounts payable and budgetary control system, the spokesman said.

A joint development team will keep NCR customers informed on regulatory changes and enhancements to both the MSA software and the VRX operating system, the spokesman said.

Software sales, support and training will be handled by MSA at 3445 Peachtree Road N.E., Atlanta, Ga. 30326.

SALARY from page 1

Data entry employees, with U.S. salaries ranging from $12,300 for operators to $19,700 for supervisors, and computer operations support staff, with salaries ranging from $14,200 to $14,600, remained the lowest paid of the 20 positions.

Other managers were supervisors of computer operations, up 5.7% to $35,000, and data base administrators, up 7% to $35,000. More than 91% of the employees in the U.S. involved were nonunion, and more than 84% of the employees in Canada involved were nonunion.

The companies reported that they tended to provide compensatory time off in exchange for overtime and that they seldom gave hiring bonuses to recruits. The most commonly reported sources for recruits were newspaper advertisements, personnel agencies and in-house employees.

More than 80% of the U.S. companies said they give salary increases on a merit basis, far exceeding the number that give general increases, 21% for nonexempt employees and 23.9% for exempt employees. Less than 7% give cost-of-living raises.

While the highest systems and processing salary jump was 7.6% for lead data entry operators ($15,600 in 1983), a similar AMS report showed that noncomputer managers saw salaries jump by up to 17% for positions such as legal assistant services managers ($32,400 in 1983), plant managers ($41,900 in 1983) and managers of administrative services ($31,900).

The "AMS Systems and Processing Salaries Report" and the "AMS Guide to Management Compensation" are available for $90 from AMS at Maryland Road, Willow Grove, Pa. 19090.

QUICK!

Name the fastest VM dump restore, and the fastest VM sort program.

(SYBACK & SyncSort CMS. What took you so long?)

Call (201) 568-9700.

Meet our super-sonic systems.

If you didn't choose SYBACK and SyncSort CMS as the fastest in their categories, *do not* go directly to jail. But read this very, very carefully.

SYBACK, our fast dump restore for VM systems, and SyncSort CMS, the only high-technology sort for VM/CMS, represent a great technological leap forward. No other programs of their type can provide all three of the following positive advantages:

(1) THE FASTEST VM PERFORMANCE: SYBACK and SyncSort CMS make data move like greased lightning. Compared to their "competitors," these programs can save a tremendous amount of computer resources:

- **50% in Elapsed Time;**
- **45% in VTime;**
- **55% in TTime;**
- **75% in SIOs.**

These savings are the result of our exclusive Fluid Buffering Technique (FBT). First developed in OS and DOS sorting, we've now extended the benefits of FBT to VM backups and sorts.

(2) THE BEST VM PRODUCTIVITY: SYBACK and SyncSort CMS have tremendous operational flexibility and user friendliness. They're rich in features designed to reduce human intervention in backup and sorting:

- **SYBACK**—Automatic backup based on CP directory • Stand-alone restore capability • Incremental backup facility • Catalog of backup operations • Multi-tasking and execution under CMS • Interactive command processing • Standard-label tape support • Callable by user programs • DASD to DASD conversion and copying. Much, much more.

- **SyncSort CMS**—Sorts CMS, SAM (OS or DOS), or VSAM files • Can be invoked from COBOL, PL/1 or BAL programs • Dynamically allocates disk space • Selects relevant records for sorting • Reformats records on output • Performs summaries of designated numeric fields • Produces reports with pagination, headings and dates • Can often produce simple reports in one day rather than, say, five. Much more, too.

(3) THE FINEST TECHNICAL SERVICE: Our Technical Service specialist are experts in their individual fields. You can count on fast, efficient, courteous service in both backup or sorting operations. More than 85% of all user requests for service are resolved within 24 hours.

CAVEAT EMPTOR: As with all performance software programs, the best way to find out what SYBACK and SyncSort CMS can do is to benchmark them yourself against your present programs.

That should help you make up your mind *fast!*

Amdahl offers cache for new, older drives

SUNNYVALE, Calif. — In conjunction with its announcement of a higher capacity IBM 3380-type disk drive, Amdahl Corp. last week unveiled a disk cache memory feature said to boost performance on the newly announced 6380 and older 6280 disk drives.

The Cache Controller Feature (CCF) was developed for environments that contain frequently used data. By adding an electronic memory, or cache, to the 6380 storage control unit, users can supply data directly from the cache to the processor at maximum channel speed, Amdahl said.

The 6880 CCF is available for IBM's MVS and MVS/XA operating environments. When used with the 6380 disk drives, it resides in the 6880-G2 storage control unit and can accommodate 4M to 16M bytes of memory. In the 6380 environment, the CCF supports a 3M byte/sec data transfer rate, the vendor said.

When used with the 6280 disk drives, the CCF resides in the 6880-A2 storage control unit and offers either 4M or 8M bytes of memory. Data transfer rates of 1.53M, 1.86M or 3M byte/sec are supported, according to the vendor.

The cache consists of separate memory, processors, power supplies and an operator panel and is said to be independent of the disk subsystem.

An independent microprocessor updates cache memory concurrently as data is transferred to and from the host processor, while maintenance of data in the cache relies on an extended, least recently used replacement algorithm, which is said to ensure dynamically that active data is available in the cache.

The CCF can switch itself off-line if "uncorrectable errors" occur, Amdahl said. In such an instance, the storage subsystem continues operation with no functional interruption, company officials added.

First shipment of the CCF is scheduled for the second quarter of this year for the 6280 and the third quarter for the 6380. The purchase price ranges between $61,100 and $207,200, depending on control unit model and memory size. Leasing programs are also available.

Amdahl is based at 1250 E. Arques Ave., P.O. Box 470, Sunnyvale, Calif. 94086.

ANALYSIS

Despite late entry into 3380 market, Amdahl competitive

By Robert Batt
CW West Coast Bureau

While not the first to announce a direct competitor to IBM's 3380 disk drive, Amdahl has managed to develop a product in time to remain competitive with other manufacturers of IBM-compatible, 3380-type units.

Although Storage Technology Corp. and Control Data Corp. have both introduced 3380-type drives, neither firm has thus far shipped the devices in large quantities. Storage Technology's division vice-president for I/O products, Bob Williams, recently told *Computerworld* that the firm has installed slightly more than 100 units. CDC admits its 3380 look-alike program is way behind schedule. Industry watchers contend CDC fairly recently installed its first beta-site versions of the drive.

While the plug-compatible manufacturers have lagged behind in bringing 3380 look-alikes to the market, IBM appears to have whipped its 3380 manufacturing lines into full swing. As of the end of 1983, approximately 38,000 of IBM's 3380s had been installed, according to International Data Corp. (IDC), a market research firm in Framingham, Mass. IDC estimates IBM will install between 45,000 and 50,000 of the 3380 drives during 1984.

According to Greg Kelsey, senior analyst at the San Francisco investment firm of Hambrecht & Quist, since no other competitor has been able to ship a 3380-compatible product in any volume, Amdahl can look forward to a sizable backlog of 6380 orders. "We estimate that shipments of the 6280 and 6380 will generate revenues for the company in excess of $150 million in 1984, and if you count products leased, it will amount to around $300 million," Kelsey said.

Company officials said they expect shipments of Amdahl storage products to increase between 30% and 40% this year, with about half the increased shipments coming from sales of the 6380. Hambrecht & Quist estimated the number of Amdahl storage units that will be sold this year at around 2,400.

Currently, Amdahl has sold its 6280 product, introduced in late 1982, to 200 customer sites, 15% of which do not currently possess an Amdahl processor.

"[Amdahl had] already carved out a niche for itself with the 6280 at a time when plug-compatible vendors were in the doldrums; the 6380 will make Amdahl more cost-effective, and I expect it to pick up some business from IBM," commented industry analyst Jim Porter at Disk Trend, Inc. of Mountain View, Calif.

"The feeling is that Amdahl has the technology to match anything that IBM may come up with," said Sally Upjohn, associate analyst at Hambrecht & Quist.

AMDAHL from page 1

enclosures, each containing one actuator. The enclosures are said to contain 630M bytes of data, with an average seek time of 15 msec and an average latency of 8.3 msec.

Requires less floor space

Like other plug-compatible manufacturers making 3380-compatible disk drives, Amdahl claimed one major selling point of its drives is it requires less floor space than IBM's 3380.

The firm said the 6380 requires total floor space of 23½ square feet, 40% less than the 3380.

Unlike its IBM counterpart, the 6380 does not make use of thin-film-head technology. Rather, it uses the older ferrite-head design.

Although not designed to compete directly with an upgraded, double-density version of the 3380 — a device many industry watchers believe will be announced by IBM later this year — Amdahl officials insisted the 6380 ferrite-head technology can be enhanced to keep pace with IBM. Industry watchers have speculated that IBM will announce a new version of the 3380 that will offer 1½ to two times the capacity of the current models.

The 6389 Model AA4 costs $81,200 when purchased in quantities of one to five units. On a three-year lease plan, the unit costs $2,433/mo. The monthly maintenance fee for the 6380 AA4 is $360 on an 11-hour, five-day plan, according to the vendor.

The Model B4 costs $55,600 when purchased in quantities of one to four units. The unit costs $1,772 on a three-year lease. The monthly maintenance fee is $248 on the 11-hour, five-day plan.

Both will be available in the third quarter, the vendor said. A full-string, 10G-byte configuration costs approximately $914,880, Amdahl said.

When purchased separately, the 6880-G2 storage control unit with a standard two-channel switch costs $66,730. The unit leases for $2,084 on a three-year plan and carries a $220/mo maintenance charge on the 11-hour, five-day plan.

Amdahl is located at 1250 E. Arques Ave., P.O. Box 470, Sunnyvale, Calif. 94086.

Export act compromise sought

WASHINGTON, D.C.— The U.S. House and Senate in the coming week will start hammering out differences in their bills to amend the Export Administration Act. The act, temporarily extended, expires at the end of this month.

The Senate bill, passed March 1, is viewed much less favorably by the electronics industry than the House bill, which was approved late last year. Among other controversial provisions, the Senate legislation would give the Department of Defense greater statutory export license review authority in U.S. trade to non-Communist countries. Exporters fear this would add delays to the processing of export license requests.

Further weakening Commerce Department authority in export administration, the Senate bill would also transfer export law enforcement from Commerce to the U.S. Customs Service.

In general, high-tech industry representatives say the House legislation favors business interests, whereas the Senate bill comes down more on the side of government agencies who argue that stricter export controls are needed to keep the Soviet Union and its allies from obtaining strategically useful American technology. The differences between the two bills are substantial, and the conference to produce a compromise bill is expected to be long and difficult.

Fujitsu share in Amdahl Corp. nears 50%

Move seen giving Japanese firm ready-made conduit into U.S. for range of products

By Robert Batt
and Peter Bochnik
CW Staff

SUNNYVALE, Calif. — Fujitsu Ltd., Japan's leading computer manufacturer, last week greatly increased its stake in Amdahl Corp., giving Fujitsu what some analysts feel is de facto control of Amdahl.

While Amdahl executives said the action was a friendly move, industry analysts said the Japanese company now has effective control over a distribution and service organization that inevitably will be used as a conduit into the U.S. for a wide array of Fujitsu products.

The Japanese giant, with sales of $4 billion last year, said Tuesday it has reached an agreement with Heizer Corp., a Chicago-based, publicly held investing company, to buy Heizer's six million shares of Amdahl common stock for $180 million at $29 per share.

Fujitsu also negotiated warrants entitling it to an additional 2.5 million shares.

Jump to 49.5%

The accord, if ratified by U.S. and Japanese authorities, means Fujitsu will increase its stake in Amdahl from 30% to as much as 49.5%.

Amdahl President John Lewis said he had received assurances from Fujitsu that it does not plan to interfere in the management of the U.S. company and would not seek additional stock.

"Over the years, we have worked closely with Fujitsu, particularly in the areas of research and development. I think it has become apparent to Fujitsu that Amdahl is very important to them, and they want to ensure that no unfriendly party comes in and buys up the stock," he explained.

An industry analyst, Dale Kutnick, executive director of The Yankee Group, observed that "for all intents and purposes, Fujitsu now owns Amdahl. They are the majority owner: You don't have to own 51% [of the stock] to do it; effectively they can control the company."

Positive move for Amdahl

Kutnick said the move "is very positive for Amdahl" because the company needs outside investment "to keep up with IBM."

Kutnick said he does not believe Amdahl will come out with another computer of its own and will instead assume the role of a value-added U.S. distributor of Fujitsu products. "Amdahl by itself doesn't have enough leverage to continue to support a large systems market," but does have the distribution, marketing, sales and service organization Fujitsu needs to be a major factor in the U.S. market, he said.

Peter Lebe, an analyst with Smith Barney, Harris Upham & Co., observed: "From Fujitsu's point of view, Amdahl is becoming increasingly important as an entry point for its large machines [and] disk and communications products in the U.S. This deal is a way of cementing the relationship . . . and from the Fujitsu perspective, it will guarantee that a large block of stock will not fall into troublesome hands."

Lebe said it is likely that Fujitsu will use its leverage with Amdahl to market its supercomputer — the VP-200 — in the American market. "With Amdahl having an installed base of around 600 IBM-compatible users, it has to be very appealing for Fujitsu in marketing its largest machines, and from Amdahl's point of view it would give them an extra product to sell at no risk," he said.

Bill Easterbrook, analyst with the firm of Kidder-Peabody & Co., Inc., agreed the move protects Amdahl's stock price because if Heizer had simply distributed the stock to its shareholders, "many of them would have probably turned around and sold it."

Commenting on Fujitsu's strategy, Easterbrook said, "I think Fujitsu can now do what Japanese companies have been looking to find a way to do for a long time. It gives them a large and respected marketing and servicing organization in the U.S. and in Europe. They can funnel everything they have, not just large systems, through Amdahl, and over the longer term I think that will eventually happen."

Fujitsu has worked with Amdahl for several years, assembling some computer components in Japan, building disk drives sold under the Amdahl label and exchanging technological information and patent licenses.

Three Fujitsu executives are directors of Amdahl, and the two companies have signed a marketing agreement prohibiting Fujitsu from selling its mainframes directly in the U.S. and Canada. Easterbrook said Fujitsu is likely to gain the Amdahl board seat formerly occupied by Heizer.

Here's a deduction that keeps on saving you money:

SAVE 25% ON ALL YOURDON PRESS BOOKS.

through April 15, 1984.

It's tax time. Everyone's looking for ways to save money. Everyone's looking for another deduction. Yourdon Press gives you both.

With this special offer, you can save two ways: by taking advantage of the 25% discount, and by using our expertise to cut your software costs. Yourdon Press is the leading publisher in the areas of software development and the structured techniques. Our books show you how to build efficient systems, saving time, money, and manpower. Your savings multiply year after year.

And, next April, you may be able to deduct the cost of our books from your income tax as a professional investment. So look no further.

To order, call 800-223-2452, Ext. 3328, or use the coupon below. Either way, you keep on saving.

Amdahl adds pair of 580 series processors

By Tom Henshel
CW Staff

SUNNYVALE, Calif. — Amdahl Corp. has expanded its 580 line of IBM-compatible mainframes with attached and dual-processor configurations of its 5860 processor. The firm also announced this month that performance on new shipments of the smaller 5850 processor has been increased by 5% to 7%.

At the same time, Amdahl cut prices on its current mainframe lineup by 3% to 14% and boosted the amount of main memory available on the entire 580 line to 64M bytes.

In addition, Amdahl announced it will support up to 128M bytes of main memory on all multiprocessor configurations in the 580 line by the first quarter of 1985. The firm said all multiprocessors will support 48 I/O channels by the first quarter of 1985.

Amdahl increased main memory on the top-of-the-line 5880 processor from 64M bytes to 128M bytes, while the maximum number of channels was expanded from 36 to 48, the firm said.

1. CW estimates based on vendor-supplied information. Relative performance ratings are based on an IBM 370/168-3 equaling 1.0. These numbers are designed to rank the processor into perspective with other systems; they do not necessarily reflect a buyer's guide. All systems are not alike. They run different operating systems, multiwidth data and addressing and, therefore, cannot be directly compared. In addition, actual relative performance may vary with the system.
2. Does not include disk, peripherals and software.
3. Vendor states.
4. Includes processor, console, power supply and air conditioning.
5. The 5860 and 5880 have two 256K-byte caches. The 5870 and 5880 have four 256-byte caches.

Called the 5867 dual processor and 5868 multiprocessor, the newly announced systems reportedly offer from 1.25 to 1.4 times the performance of the firm's 5860 uniprocessor. Unlike users of IBM's X model 3080 systems, users of Amdahl 5840, 5850 and 5860 systems can upgrade their processors to the 5867 and 5868, Amdahl said.

The 5867 and 5868 can be upgraded, respectively, to the firm's larger 5870 and 5880 processors. Amdahl has yet to deliver 5870 and 5880 series processors, a spokeswoman said.

The domestic purchase price of the 5867 processor with 24M bytes of main memory and 16 channels is $3,410,000. Maintenance on the system costs $12,500/mo. A 32M-byte, 32-channel 5868 processor costs $4,070,000, with a monthly maintenance fee of $13,950. Both processors will be available in the third quarter, the spokeswoman said.

As examples of the price reductions on existing 580 series models, Amdahl said a 5860 processor with 16M bytes of main memory and 16 channels used to cost $2,700,000 and now costs $2,600,000. Likewise, a 5870 processor with 32M bytes of main memory and 16 channels used to cost $4,920,000 and now costs $4,230,000. Finally, a 5880 processor with 32M bytes of main memory and 32 channels used to cost $5,300,000 and now costs $4,730,000, the firm said.

Model-to-model upgrade prices decreased for migration from the 5840 to the 5850, from the 5850 to the 5860 and from the 5870 to the 5880. As an example, Amdahl said the cost of a 5850-to-5860 upgrade was decreased from $350,000 to $250,000.

In addition to the processor announcement, Amdahl said all its 580 series machines can now support IBM's MVS/SP Version 1 Release 3.4 and VM/SP High-Performance Option Release 3.4. The firm also announced support for MVS/SP Version 2 Re-

See [illegible] page 7

WIRES from page 1

tached to "patch panels" on adjacent floors by a single 1¼-in.-round batch cable that is the equivalent of 32 cables (see Figure 1). The panels provide coaxial cable connections for up to 32 devices.

This approach is said to be particularly useful for financial organizations and other companies that move around a lot of equipment.

Another option being considered by companies looking for a way around the single-wire-per-device environment is multiplexing, an alternative employed by John Hancock Mutual Life Insurance Co. in Boston (see Figure 2). According to Tom Mangone, director of facilities management in the information services group at John Hancock, space is a scarce commodity in vertical risers in the eight-year-old John Hancock Tower.

Hancock's solution

Hancock's solution to the worsening problem was to pull all of its 3270-type terminal controllers back into the data processing center and run a broadband coaxial cable in the little space left in the risers.

The 32 ports on each terminal controller are multiplexed over a single cable, and device connection is provided by remote multiplexers, which are located on roughly every other floor of the building, according to Mangone.

While this system would seem little better than running a single cable from a host to a remote terminal controller that supports 32 devices, there are a number of benefits.

For one, in the John Hancock system, the multiplexed line need not terminate at a single point. This enables a centralized terminal controller to support terminals on different floors with one cable. When cluster controllers are dispersed throughout an organization and used to support terminals on different floors, wires for those devices must be run back into the risers to the appropriate floor.

Other benefits realized by putting the controllers in the computer room include the ability to operate them in local attach mode and provide them with a "clean" power supply. The dedicated power supply lowered error rates for the controllers, the director said, and the local attach mode "vanquished" the six- to eight-second response delays the company was previously experiencing.

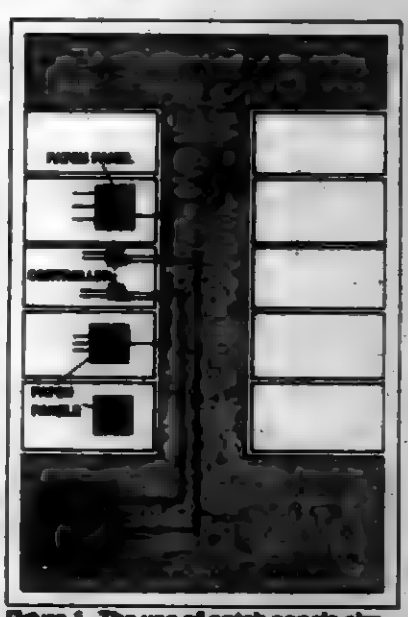

Figure 1. The use of patch panels simplifies wiring, particularly in corporations where equipment is moved frequently.

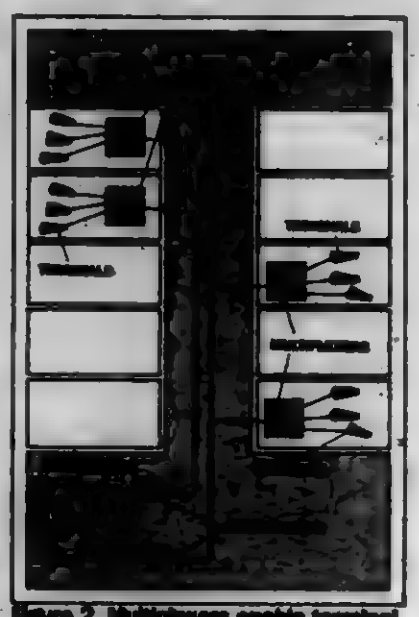

Figure 2. Multiplexers enable terminal support to be placed where it is needed as well as to reduce wire in the risers.

All told, Mangone said he expects the new cable system to meet John Hancock's needs for the rest of the decade.

The company employs 7,000 people and has roughly 3,000 terminals in place. The multiplexing system has the capacity to support between 6,000 and 8,000 terminal devices, he said.

American Express to leave its problem behind when it moves

By John Shu
CW Staff

The ideal situation for a company facing severe wiring problems is to have the opportunity to start all over again from the ground up. That is generally a luxury reserved for companies that are moving into new buildings, as is the case with American Express Co.

Mino Akhtar, manager of advanced technologies with American Express' corporate systems group, said that the cabling problems in the company's present building encouraged the study of wiring alternatives for the new building it will begin moving into at the end of the year.

In consideration of the problem, requests for proposals were issued to manufacturers of local-area networks and private branch exchanges (PBX). The company concluded that a premisewide local-area network could not be justified in terms of cost and that users did not need the capabilities offered. It was decided, however, that small local networks would be needed at the departmental level in the future, Akhtar said, mostly because of growth in the use of personal computers.

And while American Express has signed an agreement with AT&T Information Systems, Inc., Akhtar said it was too risky to have the single, 15,000-line Dimension System 85 digital PBX support American Express' voice and data needs because of the fear of creating a single point of failure.

Instead of either of those alternatives, American Express decided to wire its building with a single type of wire, a "kind of twisted pair," Akhtar said. While the particulars are still under wraps, the manager divulged that the wire will be accessible from every desk in the new building and used to interconnect the company's 2,000 to 3,000 workstations, which include Wang Laboratories, Inc. terminals and IBM 3270-type terminals and Personal Computers.

Akhtar also said that a broadband cable would be installed that would interconnect conference rooms and be used for video applications.

Bankers say crime more potential than real

CW at BAI security conference

By James Connolly
CW Staff

WASHINGTON, D.C. — Is computer crime in the banking industry outrunning the technologies and the managers commissioned to stop it?

Not according to bank security officials who were polled here last week at the Bank Administration Institute's Bank Security Conference and Exposition. According to these attendees, crime is more of a potential than an actuality, and crime prevention systems are keeping pace with the problem.

"It's getting easier and easier for us every day. The technical people are affording all of us the protection we can ask for," said Herbert E. Grimm, one of the 400 conference attendees and a security officer for Burke and Herbert Bank and Trust Co. in Alexandria, Va. "What I've found is that we have to have somebody on our side who can talk to the computer people, who can talk their language and express our concerns.

"Of course," he added, "there is always somebody trying to get into the system, and the crooks are going to school to learn more about computers."

Hee Ja Lee, data security officer for Riggs National Bank here, thinks that "so far, the vendors have reacted very well. There are protections for the communications links and encryptions that make it very difficult to get into the computer.

"Of course, we are always looking to make it more secure, and there is always the potential for fraud with everything on-line now," she said.

She noted that some problems remain with convincing data processing personnel to be security conscious. "Too often they say, 'Nothing has happened yet. Why do you treat us like criminals?' "

Involved in security for 22 years and in bank security for five years, Willie Simmons Jr. of Chicago added, "It's a climate for security that you have to establish, not just for the computer room but as an institution. If the bank itself has a climate of security, the people in the computer room won't be saying that we are singling them out."

Simmons also noted that protecting against computer-related crime requires a "balancing of interests." In establishing computer security, he and the operations managers start with minimal precautions and build a system from there, rather than starting with the maximum and then fashioning a system by eliminating steps that limit operating capabilities.

"I consider myself a businessman first and in security as a vocation. I can't put on controls that mean the bank won't make money," Simmons noted. "My concern is that the money they make, they keep."

Of principal concern to attendees were the issues of electronic funds transfer and automated teller machines (ATM).

Grimm reported, "We don't have problems with the ATMs, we have problems with the people. They give out their personal identification numbers to their kids or leave their cards and numbers lying around."

Two conference speakers noted that the greater threat to the bank itself is with physical robberies of ATM customers and service representatives rather than ATM fraud.

John W. Kennish, director of security at Commerce Bancshares in Kansas City, Mo., and attorney Bernard Pyllit of Indianapolis argued that banks with lax security face liability suits if customers are robbed.

The problem of computer-related crime is societal, maintained Steve Bandura, assistant security officer of First National Bank of Allentown, Pa.

"I don't think computer crime is technological so much as the fault of society itself. Everything is shifting into the financial sector because it is easier to go out and pass a bad check or credit card than to hold up the local 7-11 store," he said.

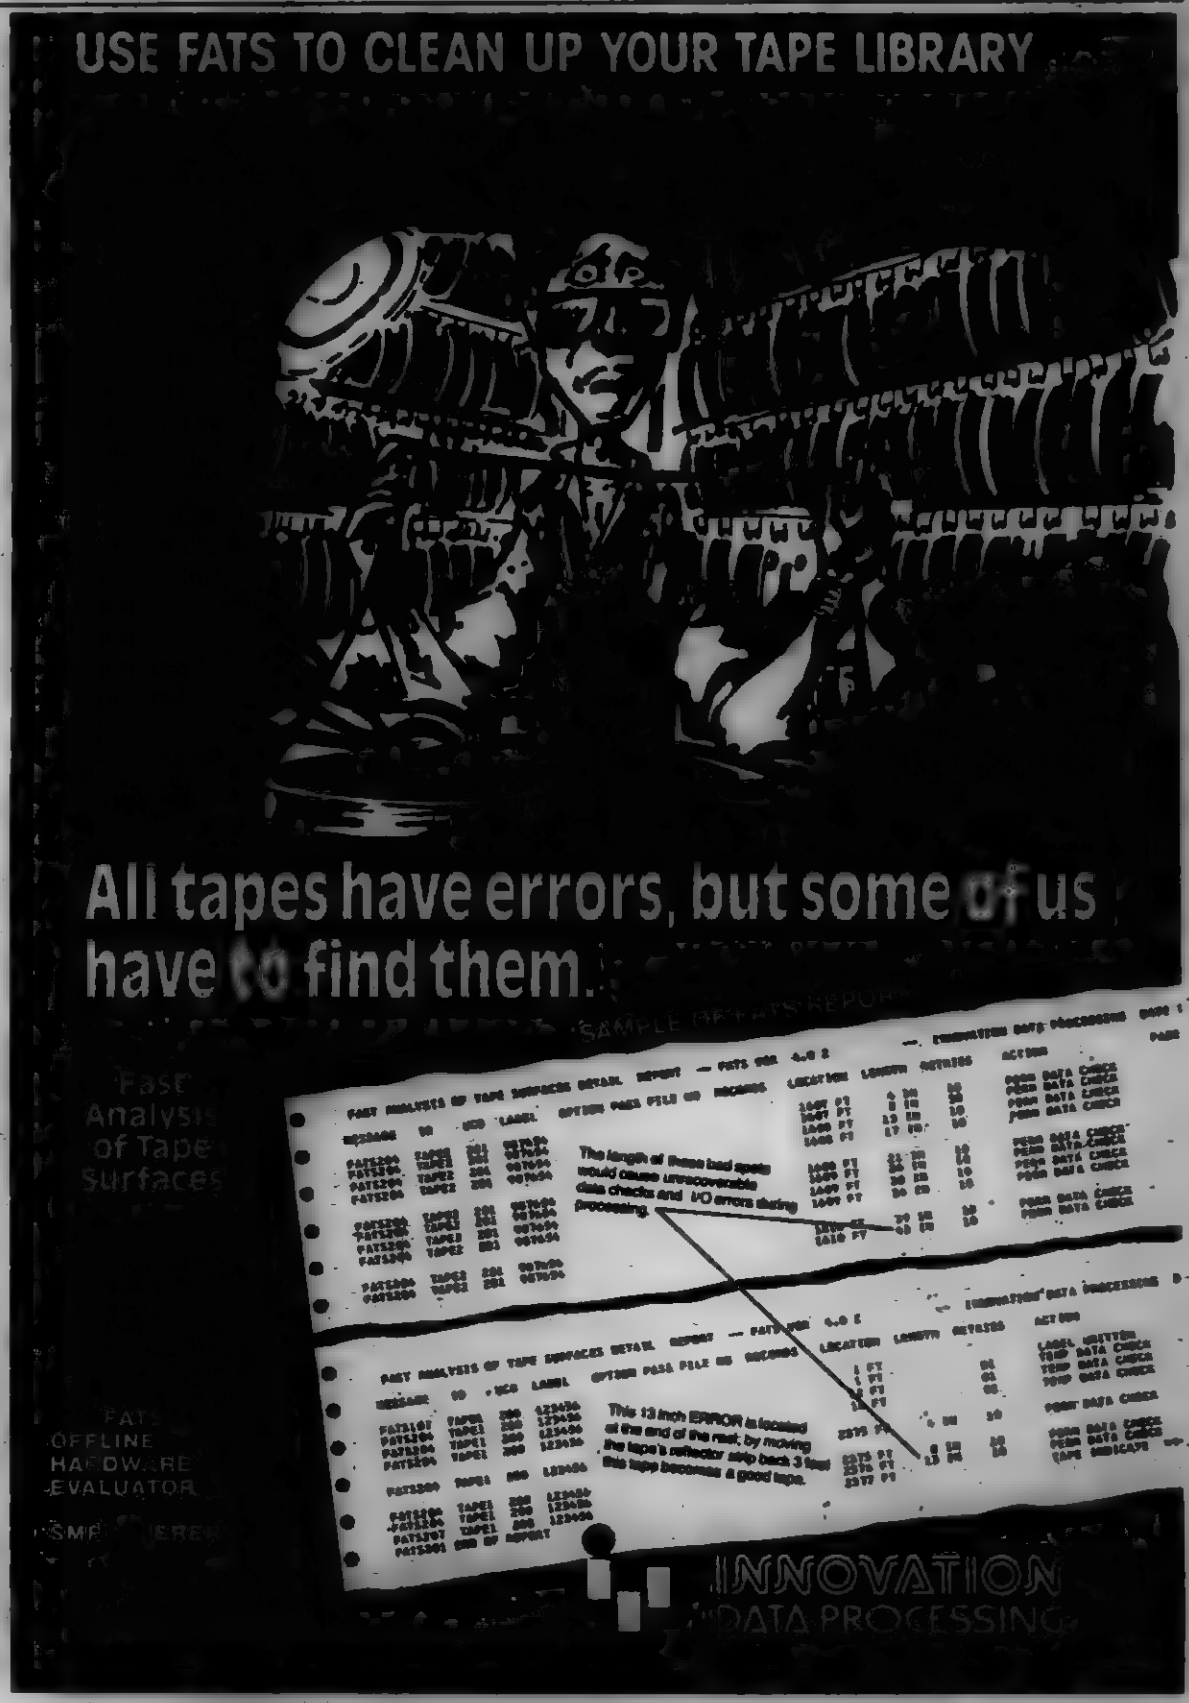
MODELS from page 6

lease 1.2 on all 580 series processors and 470 series models with the firm's 470/XA feature.

In addition, Amdahl will provide support for up to 64M bytes of main memory for users of IBM's VM/SP High-Performance Option Release 2.5 and up on all 580 models.

Industry watchers characterized the changes in Amdahl's product lineup as a response to IBM's recent announcement of higher performance X models in its 3080 line [CW, March 5].

William Easterbrook, an analyst with Kidder-Peabody & Co., Inc. in New York, noted the new Amdahl processors offer one distinct advantage over IBM: They are field-upgradable from currently installed models.



NEWS

AT&T's presence was clearly in evidence at the recent Uniforum Conference in Washington, D.C. — the third annual international conference and exposition for Unix users — underscoring its commitment to Bell Laboratories' Unix System V as the industry standard operating system.

Jack Scanlon, vice-president of the computer systems division of AT&T Technologies, Inc., joked that AT&T's forces were there to "break up the government." But the industry giant's focus was clearly on the promotion of Unix, an effort that included the announcement of an enhanced version of System V, the introduction of AT&T's own Unix applications and a joint agreement with Digital Research, Inc. to market a library of Unix application software.

In an effort to encourage industry acceptance of System V, Scanlon said in his keynote address at Uniforum that AT&T is committed in 1984 to "improving Unix's packaging for the low end; improving its overall user-friendliness; continuing to populate the list of computer companies, especially at the high end, which offer Unix operating systems as a fully supported product; and improving our user support."

A 18-year veteran of AT&T, Scanlon has become something of an industry spokesman for Unix. In a recent interview with Computerworld staff writer John Gallant, he spoke on the future of the operating system, its limitations and on coexistence in a marketplace that now includes IBM.

AT&T's Scanlon details the future of Unix

Unix enjoys wide programmer popularity, but it is not recognized as a user-friendly operating system. How do you respond to speculation that Unix's popularity will be limited in the future?

There is no question that on desktops Unix needs some improvements. But you have to ask if there are fundamental limitations to other operating systems that will be tougher to overcome.

We have used Unix to deliver complete turnkey systems inside AT&T for years, into environments with very unsophisticated users. In each case, a unique user interface was developed to make the interface to the machine as seamless as possible for the particular application. It's no big deal . . . it's not a fundamental tear-up of the operating system. You simply add an interface layer on top of it.

If you look at the limitations other operating systems have to overcome, coming from the personal computer basis up to meet new requirements as the technology evolves, I think they have more fundamental problems. They have to go from a single-task environment to a multitasking environment; they have to go from a nonvirtual memory environment to a demand page virtual memory environment; and they have to add communications capabilities and networking. Those are fundamental additions that have to be made to an operating system, and they don't come easy.

We already have a line of Unix computers that are in heavy deployment within our own company and with other selected customers. We think there is a real opportunity to move those computers into the broader commercial marketplace.

Is it practical to run Unix on large, business-oriented processors?

Unix started on the minicomputer, but inside AT&T we've got Unix running on mainframes. Unix plays very well across mainframes, minis and micros. It has this accordion-like capability to spread across that entire range. It gives you a real leg up on interconnecting those machines. We see that as fundamental if the microcomputer is ever to become a really useful device for accessing corporate data sitting on a mainframe.

In that sense, is Unix the micro-mainframe link everyone is looking for?

Absolutely. That's one reason we're successful in getting other companies to go with Unix. They see it as a way to start gluing together their incompatible architectures, and they see it as the technology that may someday make the distributed dream come true.

Will the commercial migration of Unix to the mainframe environment be the next major step in the growth of the Unix market?

If I was a betting man, I'd say that was a reasonable bet.

What type of hardware support for Unix can we expect from AT&T in the future?

We already have a line of Unix computers that are in heavy deployment within our own company and with other selected customers. We think there is a real opportunity to move those computers into the broader commercial marketplace.

What types of hardware, and when can we expect them?

I don't want to get into the details of that. When we're ready to announce them, we'll roll the whole thing out.

Does IBM's decision to go with Unix on its Personal Computer make it a slave to AT&T in that arena, or will IBM drive the Unix marketplace simply because of its larger user base?

Well, I don't think either one of those [theories] is true. IBM's announcement is a very positive thing for Unix, which is our pride. On that basis, we're very happy to see it happen.

We're all anxious to see some standards evolve, especially with independent software vendors. I think the message to the independent software vendors is that by going to Unix, the marketplace for their products is enhanced. We think that's good for us and good for the industry.

Will Unix become a self-fulfilling prophecy with all the major firms entering into the marketplace?

Most of these companies are high-tech firms that don't hop on hype. These are all businessmen. If they didn't think going toward Unix was a good business decision, I can't believe they would proceed with it.

I don't see Unix as something that will happen because big companies say it will. If you look at the history of the industry, good standards get adopted because they are good, not because somebody says, 'Hey, everybody get up and salute.' Unix speaks for itself.

The hardware guys like Unix because it gives them some freedom for architectural thought. The independent software vendors like it because it broadens their market base and insulates them from choosing which box to target their products toward. They don't have to worry that they'll pick the wrong box and go out of business next week. The end user likes it for the same reason — he doesn't want to be stuck with Company X's box forever.

IBM's announcement is a very positive thing for Unix, which is our pride. On that basis, we're very happy to see it happen. . . . I think the message to the independent software vendors is that by going to Unix, the marketplace for their products is enhanced.

If IBM comes out with its own version of Unix as rumored, what effect will that have on AT&T's current control over the Unix marketplace?

We're anxious to see IBM and other companies go with our standard. We think it's good for the whole industry. A lot of the industry infrastructure — the value-added resellers — agree with that. It's been our product for a long time, and I think the industry has been pretty successful going with our standard.

If IBM goes another way, that will be unfortunate because it will have a diversifying effect on the industry.

Why did you choose Digital Research, Inc. as a partner in the development of the Unix System V application library?

As one of the largest software companies, it has established retail channels we think can be valuable to us. It has also made a strategic decision to move away from the operating system business into the application business. It had also decided to move along Unix lines.

Can we expect any similar AT&T agreements with other software manufacturers in the future?

There's nothing exclusive about the [Digital Research] arrangement. We plan to work out similar arrangements with other companies if they meet our business interests.

Bankers told EFT more secure than phone

CW AT BAI SECURITY CONFERENCE

By James Connolly
CW Staff

WASHINGTON, D.C. — Banks have shied away from computer-terminal-originated electronic funds transfers (EFT), although such transactions may be more secure and more cost-effective than telephone transfers, bank security officials were told here last week.

However, those officials at the Bank Administration Institute's Bank Security Conference and Exposition also were told that the secrecy that surrounds EFT fraud leaves experts able only to speculate about how to prevent losses.

EFT specialists from Crocker National Bank of San Francisco and Corestates Financial Corp. of Philadelphia told the bankers that customers' use of the terminals can make the customer more responsible for authenticating transfer requests and reduce the likelihood of fraudulent human manipulation of transfers.

"Payments in electronic form move much faster than paper transactions. The potential for extremely large fraud loss is great," Rosemary O'Malley Laphen, senior vice-president of Corestates, said. But she noted that there have been no publicized instances of fraud involving terminal-originated EFTs and that few instances of telephone-originated EFT losses have been made public because banks fear the resultant publicity.

Christopher Huppert, product manager for Crocker National Bank, added, "With terminals, there is a cost savings for us. In addition, the customer has to sign a contract outlining our responsibilities and his before the terminal service is allowed. It's with the telephone where we see all of the fraud, and more with the telex than with the phone.

"One problem is that the banks won't discuss their losses," he continued. "I believe they are there. I know the crimes have been perpetrated, but I don't know how successfully." Huppert reported that the majority of EFT, since it originated in 1918, might have begun with a customer calling the bank and without written contracts, largely because of tradition.

He said banks have feared terminal transfers because of the idea of allowing a customer to communicate directly with the bank computer in regard to large sums of money.

He noted that reluctance has centered on the use of terminals for one-time, nonrepetitive transfers, where customers send funds to accounts for land deals and transactions other than routine, periodic, prearranged payments such as payroll disbursement.

Laphen noted that use of terminals minimizes the risk of an unauthorized person requesting a transfer, because it makes the customer responsible for verifying identification numbers and passwords and eliminates several manual steps in the transaction, where the risk for fraud or error is greatest.

Laphen based her opinions on research conducted for the Association of City Reserve Banks last year.

She said the study showed that fraud in an electronic transfer system has four basic causes: the introduction of a fraudulent transfer request, alteration of a valid request, destruction of records and error.

She advised the bankers to utilize transaction-origination controls until the data is entered into the EFT system, to monitor entry of the data into the system, to protect the flow of data through communications networks, to control the computer processing of the fund request and to control output by balancing accounts and ensuring that the funds have reached the proper destination.

Huppert noted that EFT traffic rose from 1.2 million transactions worth $9 billion in 1960 to 43 million transactions worth $78.6 trillion in 1980.

Firm publishes coding standard

ESTILL SPRINGS, Tenn. — Associated Technology Co. has announced a uniform coding standard designed to help establish a company's programming practices.

The guide reportedly covers documentation and coding practices for Cobol, Fortran and Basic and gives examples to show how early versions of these languages can be made to meet modern programming rules.

The 62-page book is said to include examples to aid programmers, analysts, quality assurance personnel and software designers.

The cost of the guide is $23 from Associated Technology, Rt. 2, Box 448, Estill Springs, Tenn. 37330.

At last,

a system-development course that teaches you how to make decisions, not how to draw charts

I've reviewed a lot of system-development books, courses, and manuscripts in the past few years. And almost without exception, what they teach isn't what you need to know.

Some focus on how to draw analysis and design documents at more and more detailed levels...but don't convince you the documents are worth creating, updating, or using.

Some give you plenty of tips on how to handle one part of development...but don't show you how that part fits into the overall process to help you get the system done.

And many teach you how to provide for details that are likely to change during a project...but don't tell you how to make the big decisions that will be stable and keep the project on track.

Is there a better way to develop business systems?

Unfortunately, I think the courses reflect what's going on in industry. Does *anyone* have an effective way to develop business systems?

I didn't think so until I read a practical NEW book called *How to Design and Develop Business Systems*. In my 19 years in the computer industry, this is the first book I've seen that teaches you sensible ways to create business systems. And it does it by taking you step-by-step through the development of an actual system.

Emphasis on decision-making

In 279 pages, you'll learn:

- techniques to help you make the critical development decisions that affect the success of your system the most
- what documents help you move quickly from analysis to design to implementation...and how to minimize detail in them so they're easy to create, update, and use
- how to create a data flow diagram (DFD), an analysis tool you use to describe an existing system or to model a new one
- how to use your model DFD to decide what data you need in the new system
- how to use your model DFD to create a system structure chart ...a design document that breaks the system down into logical functions and points to programs, menus, and procedures
- how to use your system structure chart to decide which parts of the system you should do first
- how to make the right database or file design decisions, so you save the hours of re-programming that late changes can cause
- why your design decisions result in easier-to-maintain systems

FREE trial and unlimited guarantee

So you don't have to risk a penny, I guarantee this book 100%. It must give you some development ideas that work for you, or send it back for a full refund...*no time limit*. But first, take 30 days to review it FREE.

So get a copy TODAY. Find out how to make development decisions that lead to better business systems ...and stop drawing charts that don't help you get the job done.

To order, call toll-free 1-800-221-5528 (In Calif., call 1-800-221-5527)

OR Mail the coupon below

Manager urges info centers to limit support

CW AT EDP PERFORMANCE MANAGEMENT

By Jeffry Beeler
CW West Coast Bureau

PHOENIX — Information centers should limit their support activities to providing end users with in-house consulting services, according to Warren Brown, MIS manager at Hercules, Inc.'s aerospace division.

Speaking last week at Applied Computer Research, Inc.'s fifth annual EDP Performance Management Conference, Brown urged information center staff members to avoid intensive involvement in their clients' software development projects.

Although they can legitimately aid programming efforts in an advisory capacity, information centers should resist the temptation to participate in basic development tasks such as defining specifications, designing software and writing code. The ultimate responsibility for making a new application operational should rest squarely with the nontechnical personnel who will be using it, Brown said.

For information centers that exceed their recommended roles and become entangled in the nitty-gritty of program development, the way can prove to be paved with hazards, he warned. Brown provided an anecdote involving a large U.S. Air Force base as a case in point.

Not too long ago, the military installation completed the development of its first information center, which was equipped with three workstations and staffed with two full-time employees, Brown said. One of the center's main missions was to take up some of the application development slack left by the base's overburdened central MIS department.

Recognizing the need to make its presence known to potential clients, the information center launched its operations with an open house, encouraging the base's end users to drop by for a get-acquainted visit. But the advertising ploy backfired, Brown said. By the end of its first day of operation, the center had already fielded 20 to 30 end-user requests for application development — a much heavier response than its tiny staff was prepared to accommodate.

To make matters even worse, one of the requests for new systems came from the base commander himself. That request consumed so much of the information center's resources that the other jobs had to be put on extended hold.

The kicker to the story, Brown said, was that many of the lower priority requests were comparatively simple and could have been fulfilled in an hour or two had they not been placed on a waiting list.

Such horror stories underscore the dangers of overextending an information center's charter and have helped persuade Hercules to restrict sharply the role of its own end-user support organization, he added. Started in late 1982, Hercules' information center advises the company's end users on a wide assortment of application development matters, but stops short of doing any programming itself.

"We don't create any deliverables," Brown said. "We're striving for user self-sufficiency. Our goal is to help users help themselves."

Brown described information centers as an ideal vehicle for dispensing a corporation's in-house microcomputer services and for controlling personal computer acquisitions. But whether Hercules will use its own center as a means of limiting personal computer proliferation has yet to be decided by the company's upper management, he said.

Although he still characterizes his firm's information center as an "experimental pilot project," Brown rates the installation as a corporate success thus far. The company's information center has particularly stressed the acquisition of employees with strong nontechnical, human relations backgrounds. Although every end-user support group needs at least one technical heavyweight, "people skills have proved much more important to us than DP skills," Brown said.

"You can teach someone DP experience. But the willingness and ability to work with people seems to be inborn," he concluded.

SBA opposes DP crime bill

By Jake Kirchner
CW Washington Bureau

WASHINGTON, D.C. — The Small Business Administration (SBA) last week told a U.S. Senate subcommittee it cannot support the Small Business Computer Crime Act, a bill already approved by the House directing SBA to help small companies defend themselves against computer crime.

The agency was the lone dissenting voice as the Senate Small Business Committee began deliberations on the legislation, approved by the House last October [CW, Oct. 1]. The bill would establish an SBA/private sector task force to study computer crime in the small business sector and an SBA clearinghouse for computer crime and security information.

James Thomson, SBA associate administrator for management assistance, told the committee that although the agency wants to help small companies improve computer security, the proposed legislation would be very difficult to enact. He also said the problem has already received sufficient study, which makes the task force unnecessary.

Opening the hearing Wednesday, Rep. Ron Wyden (D-Ore.), sponsor of the House version of the legislation, said the bill is necessary because "thousands of small business people are choosing to use computers without adequate knowledge of their vulnerabilities and what steps they can take to protect the integrity of the systems."

Wyden was followed by a parade of government officials, small business representatives and security experts who supported the legislation.

SBA's Thomson said his agency "looks forward to cooperating with others to help small businesses improve the management of their computer technology and to encourage them to protect it from abuse." But, he added, although this topic is "a legitimate, growing small business concern and . . . the federal government is rightfully charged with the responsibility to help educate the small business community to protect itself from these abuses, SBA cannot support enactment" of the legislation.

He explained it would be "extremely difficult" to define the nature and scope of computer crimes against small businesses such as the bill would mandate. And, he said, "because only a very low percentage of computer crime is reported, it would be an enormous, expensive task to reach any meaningful conclusions about the unique susceptibility of small businesses to computer crime."

Much of the information the bill would direct the SBA to develop already exists, he added. "We propose instead to eliminate the formal study phase and proceed immediately to provide state-of-the-art information to small businesses on computer-related crime and abuse, along with management assistance on associated computer security controls."

He said the agency is already moving to implement this type of educational program.

Despite the SBA commitment to this type of program, congressional sources predict the legislation's supporters will push the bill in order to create a statutory mandate for this SBA effort. The SBA position on the bill had not been formalized when the House was considering the legislation last year.

Now MTI brings you famous Diablo letter-quality printing at new low prices. Call today.

MTI has them all in stock and ready to ship. Even the 630ECS series, the only letter-quality printer that can print virtually all characters the IBM Personal Computer can display, including all 128 extra characters of the PC's extended character set.

MTI is an authorized Diablo distributor, so we get these printers first and fast. The Diablo 620 API, 630 API and the Diablo 630ECS are probably the finest letter-quality printers on the market today.

Whether you lease, buy or rent our equipment, you'll find MTI is the one source for all the terminals, peripherals, systems, applications expertise and service you'll ever need. At great prices. Call us today.

Growing MIS emphasis on end-user productivity lauded

CW AT EDP PERFORMANCE MANAGEMENT

By Jeffry Beeler
CW West Coast Bureau

PHOENIX — MIS managers have greatly widened the scope of their efforts to boost their companies' information-processing productivity.

That is a departure from recent trends, in which information systems directors typically restricted their productivity-enhancement activities to their own data centers. So said Phil Howard, president of Applied Computer Research, Inc., in remarks made during his firm's fifth annual EDP Performance Management Conference here last week.

Today, the accent in the MIS managers' drive to maximize information systems' efficiency is shifting increasingly to the business world's end users, Howard said.

Managers of large corporate computing departments "are looking more and more outside their own data centers and are concentrating instead on improving the productivity of their companies' nontechnical employees," he said.

Howard applauded the increased emphasis on end-user productivity and urged MIS directors to focus their systems' resources on business areas that will yield the greatest payback for their corporations as a whole.

If information processing executives improve their own departments' performance by a given percentage, the effect on corporate profitability will be minimal. But if they can raise productivity by the same amount among their end users, the bottom-line impacts can prove dramatic, Howard said.

"Don't get me wrong," he told conference attendees during his address. "I'm not saying that DP departments no longer have to worry about managing their own performance effectively. They still do."

Enhancing end-user systems performance is often much easier said than done. Not the least of the obstacles is the problem of how to find the right people for the job, Howard said.

In the past, most of the people who were assigned to the chore of helping users remedy their information processing deficiencies came straight from the computing ranks. Although such specialists boasted strong backgrounds in technology, they typically knew next to nothing about their companies' overall businesses.

Today, Howard said, large corporations would be well advised to take just the opposite approach: Insist that all their end-user support employees have a solid formal education in general business and then make sure they gain an overlay of basic information systems skills.

Howard's preference for user helpers with a sound business grounding was greeted skeptically by at least one of the conference attendees, who urged companies to seek computing expertise first and add nontechnical know-how later.

But the publishing company president defended his original position. "Many DP people enjoy working with computers and being just technicians," he said. "They don't want to do anything else. They don't want to learn about business."

MIS planning seen fitting hand in glove with business planning

By Jeffry Beeler
CW West Coast Bureau

PHOENIX — Large companies are increasingly recognizing the need to integrate strategic business plans with corporate information systems plans and responding accordingly.

That conclusion emerged as the common theme in a number of prepared presentations at last week's EDP Performance Management Conference here sponsored by Applied Computer Research, Inc.

In many corporate quarters, overall business plans and MIS plans have long been regarded as largely unrelated to each other. But that widespread perception is unfounded and is steadily being debunked, several of the conference's speakers agreed.

MIS planning is fast becoming "part and parcel" of strategic business planning and is usually "critical" to a company's overall success, according to Charles McCaig, vice-president of information services at Mutual Benefit Life Insurance Co.

So interdependent, in fact, are information systems' plans and their general business counterparts that the two have to be done together if the former realistically expects to strengthen the latter, McCaig said.

Echoing views similar to McCaig's, Paul Robichaux, Boole & Babbage, Inc.'s senior vice-president, voiced confidence that information systems planning and basic business planning can be modeled simply and that the results can later be merged.

From an MIS manager's standpoint, one of the keys to the effective integration of systems' plans and strategic corporate plans is a strong knowledge of a company's main business, Robichaux said.

How thoroughly computing department executives understand their firms' total mission will determine to a great extent whether they ultimately rise through the corporate ranks to become their employers' chief information officers, he said.

Also key to the integration of business and information systems planning is an MIS manager's ability to create a visual model that shows how computing department activities will affect a corporation's overall performance. Such a model, Robichaux said, has to be simple enough that a senior corporate executive with little or no technical background can use it routinely to make decisions.

ICST budget cuts feared crippling, if not deadly

By John Gallant
CW Washington Bureau

WASHINGTON, D.C. — An adviser to the National Bureau of Standards (NBS) said last week that the Reagan administration's plan to cut the NBS Institute for Computer Sciences and Technology (ICST) budget in half would so cripple the agency that it would be better to disband it altogether.

The administration has been trying to transfer the ICST activities in domestic computer and telecommunications standards to the private sector. The agency would continue to represent the U.S. to international standards organizations and perform a number of research projects. The fiscal 1985 ICST budget proposal is for $5 million, compared with approximately $10 million approved the last two years by Congress.

"With the proposed $5 million dollar budget, ICST simply cannot fulfill its current mandate," according to Dr. Shirley Prutch, vice-president and general manager of Martin Marietta Data Systems, Inc. of Bethesda, Md. Prutch, who chairs an independent ICST evaluation panel, said all DP users, in both government and the private sector, "need ICST's leadership."

Prutch testified last week before the Senate Subcommittee on Science, Technology and Space, which has resisted White House efforts to cut ICST funding. She told the subcommittee that "if $5 million is all that is available, we would do better to disband ICST and thereby publicly state that [its] mandate is not needed rather than waste $5 million with results that cannot be even close to acceptable."

She added that $15 million would be a more appropriate funding level for the activities for which ICST is chartered under federal law.

Private sector to fill gap

NBS Director Dr. Ernest Ambler told the subcommittee ICST has "successfully mobilized the interest of user groups" and said he is more confident than ever that the private sector would fill whatever gap would be left if ICST ended its domestic standards work.

Sen. Slade Gorton (R-Wash.), subcommittee chairman, noting what he called "the drastic reductions" proposed for ICST funding, suggested to Ambler, "You're not wildly happy to be here defending this particular part of the budget."

Ambler said the budget cut was a difficult decision, but added that a research organization such as NBS must direct its resources to meet the role and constraints it sees developing in the future. Of the ICST budget, he said, "This is the way it all comes out when you apply those criteria."

Under questioning from Gorton, ICST Director James H. Burrows, who appeared before the subcommittee with Ambler and six other NBS officials, said he knows of no private sector organization ready to take over the standards activities of the agency if the budget cut is approved. "I don't know anybody who would replace us in the will and desire to get standards out," he said.

Lottery DP center feeling load of Mass. jackpot fever

Surge of bettors eye $13 million-plus prize

By Edward Warner
CW Staff

BOSTON — Massachusetts has caught lottery fever, and the state lottery agency's computer system has been groaning, but coping well, under the load of processing as many as two million ticket purchases a day.

The cause of the upsurge in lottery ticket buying has been the lottery's one-year-old Megabucks game, which last week offered a jackpot prize of $13 million.

A jackpot drawing was scheduled for last Saturday, but if it did not produce a winner, this week's jackpot could reach $20 million, according to the director of the state lottery's computer operations, Sebastian Piccolo.

Last week, according to Piccolo, the lottery system's computers were processing an average of 35 to 40 transactions per second, most of the ticket sales going for the 1.9-million-to-one shot at the Megabucks jackpot. Bettors in the lottery create their own six-digit lottery number on any of the state's 2,023 on-line Amtote Systems lottery terminals, located at lottery agents throughout Massachusetts.

Lottery numbers are entered on keypads or on paper cards, which the terminal reads, and sent over phone lines to the state lottery system's battery of five Sperry Corp. V77-600 computers in Braintree, Mass.

The state's computers, running software also supplied by Amtote, a division of General Instruments, Inc., record the number and send a message back to the bettor's terminal, which creates his printed lottery ticket. The computers also verify winning numbers and record lottery agents' commissions.

The winning numbers are selected manually by pulling six balls from a rotating drum of 36 balls numbered from one through 36.

Increased response time

All transactions on the state's lottery system are recorded on both a Kennedy Co. 9100 tape drive and a Sperry 8433-21 200M-byte hard disk pack recorder.

The interval between when the lottery number is entered on a terminal and when the ticket is printed out is the system's response time. Piccolo said the burden of transactions on the system had caused response time to increase from 4 to around 25 seconds prior to the March 3 drawing, when the jackpot stood at $8 million. By 7 p.m. that evening, an average of 51,000 transactions were flowing into the system every ten minutes, he said.

Piccolo said his department has since adopted measures to balance the load of incoming transactions among the system's computers and added two more computers to its front-end system.

The system's response time had been reduced to a mere 2 to 3 seconds, he maintained, prior to the anticipated buying frenzy of late last week.

Trilogy delays wafer-based CPU yet again

By Peter Bartelt
CW Staff

CUPERTINO, Calif. — Trilogy Ltd. has again pushed back its target shipment date for an IBM-compatible mainframe based on its ongoing wafer-scale semiconductor development and announced other changes that analysts believe could limit the company's market penetration when the project is completed.

The company announced March 8 that it had solved earlier problems [CW, Jan. 23] with the wafer-scale product, which is purported to pack the capacity of 100 integrated circuits onto a 2½-in. wafer. But Trilogy said it has decided to "simplify" the design process for the crucial semiconductor and also to build a dual-processor machine, rather than the single-processor version originally planned.

Those changes will push the scheduled shipment date back to mid-1986, according to Russell B. Drew, company vice-president; it had previously been scheduled for the third quarter of 1985 and then pushed back to the fourth quarter of 1985.

Both the delay and the expected increase in unit price caused by the changes may decrease Trilogy's opportunity to penetrate the marketplace significantly, according to both Jonathan Pram, a large-system vendor analyst with Paine Webber Mitchell Hutchins, Inc., and Dave Moschella, industry analyst with International Data Corp. in Framingham, Mass.

The shift to a dual processor "dilutes the significance" of the machine, and the delay will result in Trilogy entering a more crowded market, with competition looming from Japan, Pram said.

"The longer they wait, the more their advantage shrinks," Moschella said, noting that Trilogy had planned to be first in the market with the densely packed wafer-scale semiconductor, but is allowing others to catch up. He also wondered whether Trilogy will be able to meet its goal of being substantially below the cost of comparable IBM products.

Drew said the changes will result in higher system costs, but will add power and performance. The company "feels very comfortable" with market demand for high-performance machines, he said.

The metalization process that had previously caused problems with the wafer-scale prototype had been solved and did not play any role in the latest development changes, which were prompted by a scheduled development review, Drew said.

The company said the simplified design process reduces "the level of technical risk associated with the development project" and will make the wafer-scale technology more suitable for applications in computers other than Trilogy's. Both Digital Equipment Corp. and Sperry Corp. have made significant investments in Trilogy, together investing $65 million and gaining rights to the technology.

Slower processing speeds

But the redesign resulted in slower processing speeds in the single-processor configuration, according to Trilogy, causing the company to plan on the dual-processor mode it claims will have three times the performance of the recently announced dual-processor IBM 3081 Model KX; the original had been planned to have four times the performance of the single-processor IBM 3083 Model J, Trilogy said.

Within approximately one year after first shipments, according to Trilogy, the company intends to ship a four-processor, or quadratic, version.

According to Moschella, Trilogy is entering "a market where the key to success is when they get their product out there." Any delays cut into the performance advantage planned over IBM products, he added.

Paine Webber's Pram said such delays are not unusual in the development of new technology.

SDC speeds claims processing

BOSTON — After being threatened with the termination of its contract to computerize Massachusett's Medicaid program, Systems Development Corp. (SDC) has complied with an order to reduce its processing backlog.

The state Welfare Department, which oversees the Medicaid program, had ordered SDC to reduce its claims screening and processing period from roughly 34 days per claim to 15 days. After increasing its staff and installing another computer, the vendor went the state one better and reduced the backlog to 13 days per claim. This means providers can expect to hear from SDC within 30 days, instead of the almost 90 days they previously endured.

Moreover, within the last two weeks, SDC has processed 1.7 million claims totaling $100 million.

Welfare Commissioner Charles M. Atkins said he was "absolutely delighted" with SDC's performance and concurred with SDC President and Chief Operating Officer Frederick Jenny, who said the Medicaid management information system is working well and the two parties are working well together. "They [SDC] delivered on their commitment, and I really respect them for that," Atkins said.

Atkins and Jenny denied a published report that said SDC was threatening to sue the state over $7.9 million in costs attributed to change orders — costs the state initially refused to pay but will probably make settlement on after certification.

Now MTI brings you MICOM's low cost 8-channel short-haul multiplexor at a new low price. Call today.

Intemux 470™ is designed to reduce in-building or on-campus cabling and data transmission costs. Model M478 permits eight asynchronous terminals to be connected to an in-house computer facility or data PABX using only two pairs of wires at distances of up to 5000 feet. The M478 multiplexor is transparent to terminal code and speeds to 19,200 bps.

MTI is an authorized distributor for MICOM, so we get their latest equipment first and fast. And we have the expertise to put your data communications network together in the most cost effective way.

Whether you lease, buy or rent our equipment, you'll find MTI is the one source for all the terminals, peripherals, systems, applications expertise and service you'll ever need. At great prices. Call us today.

Users urged to be selective with Info language

CW AT
INFO USERS GROUP

By John Gallant
CW Staff

SAN DIEGO — "Imagine you are faced with a room full of money and you have just five minutes to remove as much as possible," proposed Jim Budd, president of Tustin, Calif.-based Command Business Systems, Inc. "To get as much money as you can, you need to have a strategy. The best strategy would be to grab all the $100 bills first, then the $50 bills and so on."

The story was provided as more than mere entertainment. According to Budd, it has great significance for users of Henco Software, Inc.'s Info fourth-generation programming language and data management system.

"Too often Info is used inappropriately for applications that could better be handled by another method," said Budd, who spoke from a user's viewpoint at the Info Users Group National Conference here. "Info is a powerful tool, but users must become more selective in choosing where to apply it. It's important to develop a strategy aimed at using Info to obtain the so-called $100 solutions and not the less-important $1 or $5 solutions, which could be obtained with traditional tools."

To develop that strategy, said Budd, who often utilizes Info in developing custom software for his clients, users must understand the system's strengths and weaknesses. He said Info is best suited to developing single-user applications and prototyping general business applications that can later be developed in another language for production environments.

"The primary strength of Info is its ability to help you see your data. It is a great data access tool. It is also well-suited to generating and managing data. Info is also strong for 'what if'-type analysis with its query and report writing capabilities. But for the traditional DP functions of managing data in a production environment, Info is not as applicable as other tools," Budd said.

According to Budd, Info does not perform as well in multiuser applications or those involving over nine data relationships. In these areas, traditional programming languages are still more useful. Budd also said the system in the past has been plagued with minor bugs, a statement almost everyone in the audience agreed with by a show of hands.

"The bugs are a sore point. But they're only shortcuts that don't work. The system is forgiving; it allows for errors and still gives the results we want. So we have to be forgiving with Info and find our way around those minor flaws," Budd said.

Viewed in one light, according to Budd, Info is no more important a tool than traditional languages such as Cobol or Fortran. But its real strength lies in the common ground it provides between end users and DP.

"Fortran and Cobol are gibberish to those of us who don't understand them. But Info has removed the veil of secrecy placed on data by DP. Users can understand what DP is saying and doing through the window of Info. This is a changing environment where Info is handshaking with other languages and fostering better communication between end users and DP," Budd said.

National Semi pleads guilty in government chip case

SAN FRANCISCO — National Semiconductor Corp. was fined $247,000 and agreed to pay damages and penalties totaling $1.4 million after pleading guilty to a 40-count indictment filed in federal court. The indictment charged the company with falsely certifying the testing of military and aerospace devices delivered to the government.

National Semiconductor and the U.S. Attorney's office here said the plea agreement, announced the same day the indictment was filed, disposes of all criminal and civil liabilities arising from a lengthy grand jury probe into the company's testing and certification of military microcircuits supplied between 1977 and mid-1981. In addition, the government agreed that no further criminal and civil actions arising from those matters will be brought against the company, its employees or its customers.

The indictment charged National Semiconductor with 17 counts of mail fraud and 23 counts of making false statements to the government. In addition to the penalties and damages, the company agreed to pay $105,000 for the government's costs for an investigation that lasted more than two years.

John Gibbons, chief of the U.S. Attorney's Criminal Division, said it is "not unusual in cases like this," involving corporations rather than individuals, for plea negotiations to be conducted concurrently with the grand jury investigation.

According to Gibbons, the government did not specify how many microcircuits were covered by the charges.

Stressing that devices that may have been insufficiently tested were as reliable as those completely tested, Charles E. Sporck, president and chief executive officer of the company, said: "We will be pleased to finally resolve this entire matter. It is important to us that the government's investigation did not uncover any instances in which undertested devices had failed in the field."

FTC to put Henco's Infotext system to test

CW AT INFO USERS GROUP

By John Gallant
CW Staff

SAN DIEGO — Attorneys at the Federal Trade Commission (FTC) in Washington, D.C., will soon begin putting Henco Software, Inc.'s Infotext document retrieval system to the test, according to an FTC staff member attending the Info Users Group National Conference here.

Infotext, which gives users the ability to include textual materials in the Info data management system, is touted by Henco as providing extensive search and retrieval capabilities for document access. Although there are currently about 1,900 Info users, only about 250 have chosen to purchase the Infotext package, according to Henco President Henry Cochran. Although he predicted a growing market for a document management tool like Infotext, the market has not developed as quickly as Henco had hoped, Cochran noted.

But, according to Dennis Lynch, a systems analyst with the FTC, that agency has already begun to utilize Infotext and will continue to expand its use if all goes well. The FTC has already provided search and retrieval capabilities for nearly 6,000 document abstracts in Infotext on the agency's two Prime Computer, Inc. Prime 750 processors running under Primos. FTC attorneys and librarians in the Washington office or in any of 10 regional bureaus can perform key word searches through the titles of the abstracts to find documents relating to any subject.

CW photo by J. Gallant
Dennis Lynch

In addition, Lynch told *Computerworld* in an interview last week, the FTC has undertaken a second, more extensive use of Infotext. About three months ago, he said, the agency began to input the full text of all documents relating to two FTC cases — one of them an antitrust suit — currently under investigation. Once the documents are keypunched into the system, attorneys working on the cases have access through terminals to all or portions of the documents through a variety of search techniques. Lynch would not divulge the number of documents involved, but he said the figure was "quite large." If Infotext proves useful in that application, the FTC's data processing staff plans to add documents relating to future cases as they arise. "Our goal was to bring many of our time-sharing jobs in-house," Lynch explained.

"One of these was litigation support, which aids attorneys in doing case research, such as word-searching transcripts or other documentary evidence. With time-sharing, we were using Infodata [System, Inc.'s] inquire on an IBM mainframe, and we wanted to provide that same functionality in-house. We were already using Info, and Infotext was really the only thing we saw that would work with our Prime systems."

Lynch said Infotext has shown "adequate" response time in testing, but he is somewhat apprehensive as to how it will perform when "pushed to the limit" by additional cases. "We still have some real questions about Infotext.

"Some of these large antitrust cases are enormous, and I doubt that we could use Infotext to maintain them," he added.

According to Lynch, the FTC hopes to have all documents relating to the test cases available through Infotext by midsummer. He said the agency has preliminary plans to unload documents for archiving once a case has been closed.

DP manager must plan, educate, consult: keynoter

By John Gallant
CW Staff

SAN DIEGO — Data processing management has lost control over many of its traditional functions, but it has gained a more important role within the corporation, according to one industry analyst.

With much of the computing power and many key applications now in the hands of end users, the data processing manager is no longer an information wizard isolated within the organization, according to John Kirkley, executive editor of *Datamation* magazine. During his keynote address at the Info Users Group National Conference here last week, Kirkley said the data processing manager must now play the roles of strategic planner, educator and consultant in helping the corporation achieve its goals. "As we move into the information age, we realize that the old methods and technologies of DP are not enough," he said.

"The DP king wears a new outfit now, but he can also be the hero of the day for the corporation," according to Kirkley.

As "backbone" of the corporation, Kirkley said, data processing must regain its control by setting standards for information use and making difficult choices in such areas as telecommunications policy and local-area network and office automation equipment.

As if that were not enough, data processing management must learn to live with increasingly demanding end users.

But the added pressures and responsibilities have their rewards, he added. "DP professionals are moving into a fascinating time where the knowledge worker is key. You know the technology, and you can be a leader in this period of change. You must exhibit that leadership not only at work, but in your communities and in the voting booth as well," Kirkley said.

Kirkley outlined the new responsibilities of the data processing manager: administering the corporate data base; leading the way in office automation; implementing an end-user strategy; concentrating on strategic planning; keeping current with developments in both hardware and software technology; establishing standards for local-area networks and telecommunications, among other things; understanding the environment in which the corporation operates; and fostering creativity in the use of information — a nebulous, but nonetheless important, goal. According to Kirkley, the changing role of data processing is evidence of what he labeled "phase three of the changing information environment.

"At first, we experienced a push toward the centralization of information, which was under the sole control of DP," he said.

"But users became increasingly restless, and we saw a move to distributed processing. But in the third phase, we see the re-emergence of data processing.

"DP is re-establishing control by becoming a policymaker and by setting standards within the organization," according to Kirkley.

Security meet set in Toronto

TORONTO — "Computer Security — A Global Challenge" will be the theme of the Second International Congress and Exhibition on Computer Security, held here by the International Federation of Information Processing Societies, Inc. on Sept. 10-12.

Speakers will address such topics as contingency planning and data and facility protection.

Registration is $595 prior to May 30; $645 prior to July 30; and $695 prior to Sept. 1, available through The International Security Congress, Inc., 160 Duncan Mill Road, Toronto, Ont., Canada M3B 1Z5.

Attention DEC* Users:

See how MTI can save you $5,260 on your next 300 lpm matrix printer.

DEC LXY12
$11,250

MTI's CI-300
(CIE Terminals)
$5,990

That's $5,260 less than the DEC LXY12, and the price includes DEC controller, cable, universal power supply, pedestal and paper basket.

MTI's CI-300 is a DEC plug-compatible LXY12 emulator. And it's a lot more printer for a lot less money. It features a resolution of up to 400 dots per inch in letter-quality mode, and up to 200 dots per inch in graphics mode. Ask your MTI salesman for information on its many advantages and superior performance over the LXY12. We are authorized distributors of CIE Terminals, and can enhance your DEC system quickly and efficiently.

Whether you lease, buy or rent our equipment, you'll find MTI is the one source for all the terminals, peripherals, systems, applications expertise and service you'll ever need. At great prices. Call us today.

Henco's battle plan: increased market power

CW Staff

By John Gallant
CW Staff

SAN DIEGO — Like a commanding officer, Henry T. Cochran is formulating strategy in response to changing events on the battlefield.

President of Henco Software, Inc., Cochran has developed a two-pronged strategy that he hopes will expand Henco's influence in its existing marketplace while taking advantage of an emerging one.

That strategy calls for the addition of multiuser capabilities to Henco's primary offering, Info, and the introduction of what Cochran described as an "integrated workstation product" combining data management, spreadsheet and word processing functions.

"In the future, we aim to address the needs of the knowledge worker better through our new workstation product. We also see the inability to create multiuser applications with Info as a major weakness that must be addressed. We are attempting to extend our existing strengths and cover an emerging market simultaneously," Cochran told *Computerworld* during an interview at the third annual Info Users Group National Conference here last week.

The as-yet unnamed integrated workstation product that Cochran was alluding to is currently under development at Henco. Slated for release in mid-1985, the system is scheduled to go to initial test sites at the end of this year. Cochran said the workstation product will be integrated with Info through what he labeled a data management unit that will reside on a corporate mainframe or minicomputer. The product is targeted toward supermicrocomputer workstations such as the IBM Personal Computer XT, he said, and will provide a "gateway" for access to the host system's data.

"Clearly, our idea in shifting to a two-product approach is to address the shift in the marketplace toward decentralized computing. We're not backing off on Info; we intend to add life to its growth cycle through enhancements. But micros add a new level of possibilities, and it's important for us to take advantage of them. The products are simply two routes to the same end."

During remarks at the opening session of the conference, Cochran was quick to assuage users who may have feared Henco's new product focus would mean a lessened commitment to Info. The second prong of his strategy involves the planned Revision 10 of Info, which Henco billed as a fourth-generation programming language and data management system.

"The primary focus of Rev. 10," Cochran told *Computerworld*, "is to make Info much stronger as a multiuser product. A workstation product doesn't share data. Info, however, is a shared data system. It is a language-oriented, command-driven product, and there are a lot of people out there who want to continue using it.

CW photo by J. Gallant
Henry T. Cochran

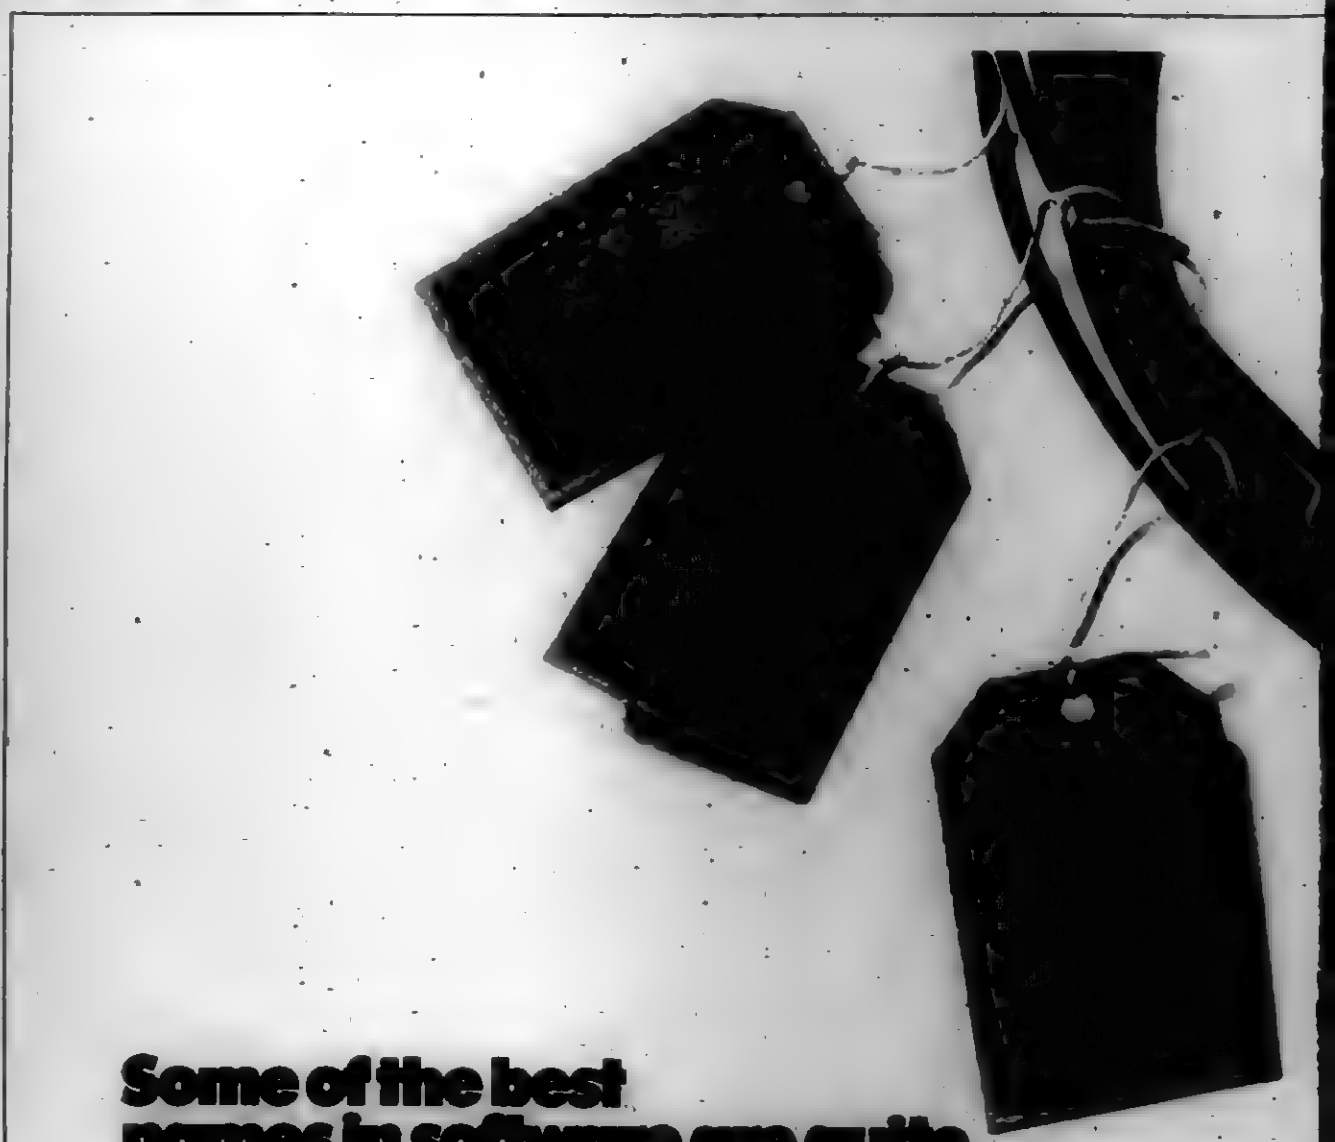
"Many people have predicted the rapid demise of dumb terminals," he continued. "I strongly disagree with that. There is a set of applications that will forever be best addressed by a shared data system accessed by dumb workstations or terminals. We've traditionally provided that capability through Info, and we will continue to do so."

Not scheduled for release until mid-1985, according to John Holman, vice-president of product development, Revision 10 will feature what he called concurrent multiple-user file updating. It will also offer record-level-locking capabilities that Holman said will make it easier for users to create multiuser applications and an upgrade path for Revision 9 applications.

CORRECTIONS

"Lotus 1-2-3, Chartmaster, Cheetah score high in package analysis" [CW, March 5] failed to note that the Cheetah graphics package, which was developed by Centec Process Systems, is marketed exclusively by Genigraphics Corp. Genigraphics is located at 4806 W. Taft Road, Liverpool, N.Y. 13088.

A chart describing millions of instructions per second (Mips) on IBM's 3080 line of processors [CW, March 5] listed the Mips rating on the IBM 3081 Model K and Model KX processors as 18.8 and 20.4, respectively. Manufacturers of competing products, as well as industry analysts, contend that in a commercial job mix, the Mips figure on the 3081 Model K should be 15. Based on that figure, the Mips rating on the 3081 Model KX should be 16.3.



Some of the best names in software are quite attached to our network.

These people know PCs. They also know a good idea when they see one. That's why they're building future networking software around today's networking standard — Ethernet. And why they chose our PC networking system to help them do it. EtherSeries from 3Com.

What EtherSeries is doing for them.

"3 large, growing, and diverse Ethernets are at the heart of our software development activities. Our 3Com hardware has been very reliable — it has never failed us."
— Bill Gates, Chairman, Microsoft (Bellevue, Washington)

"We want to develop our popular dBase II® to a multiuser networked database environment. To meet the demands of our customers we chose the high-performance 3Com EtherSeries."
— David Clayton Cole, Chairman, Ashton-Tate (Culver City, California)

"The ease of sharing information and printers led our 1-2-3® advanced development team to choose 3Com's EtherSeries® over all of the alternatives."
— Mitch Kapor, President, Lotus Development (Cambridge, Massachusetts)

"We wanted network software transparency. Our PFS:® software runs without ANY change on 3Com's EtherSeries® — it protects our user's software investment."
— Fred Gibbons, President, Software Publishing (Mountain View, California)

"The Ethernet standard and 3Com's EtherSeries® will be an important part of our in-house networking strategy. It provides the connectivity we require for our growing organization."
— Bob Frankston, President, Software Arts (Wellesley, Massachusetts)

"Our mainframe link software and Peachtree software ran perfectly in the 3Com environment. We dropped

Naivete seen as hurdle to on-line security

By John Gantz
CW Washington Bureau

ARLINGTON, Va. — The major impediment to on-line information system security is the naivete of users and providers, according to participants at a recent Videotex Industry Association (VIA) security conference here.

The two-day forum on unauthorized access was convened, VIA Executive Director Robert L. Smith Jr. said, to allow the young industry to begin developing an approach to security issues, particularly computer crime laws, before "a crisis" prompts possibly inappropriate legislation.

Forum Chairman George Minot, senior vice-president of Compuserve, Inc., said the current magnitude of the industry's security problem "is the great unknown." But, he added, "it's easily millions of dollars a month" in stolen services, system overload and downtime that denies access to legitimate users.

Asked if the association members feel federal legislation is necessary, Minot answered, "We really are naive in that regard." He suggested the member firms would support whatever deterrent is effective. Several members said they believe state legislation is preferable to a national law at this time.

"State legislation . . . is needed; it is appropriate," said Alan Grossman, director of business development and information services for Dow Jones & Co., Inc., who led forum discussions on legislation. "It is closer to where our problems are," and the U.S. Congress is more likely to follow the states' lead than tackle the issue on its own.

But, Grossman said, the industry must make sure its security practices are adequate before it can seek legislative remedies.

Based on the two days of discussions, Minot said, the association will start developing statistics and better definitions concerning the industry's security problems, begin developing security standards for information services providers and look for opportunities to work with other groups interested in DP security matters.

Addressing definitional inadequacies, Bettie Steiger, vice-president of information resources for Reference Technology, Inc., said law enforcement is hindered by a lack of definitions for property, value and damage as they relate to information services. A better understanding of what actions are malicious, unauthorized or inadvertent is needed, she said. Steiger, who moderated a discussion on considerations of security enforcement, said conference attendees were surprised to learn that the approximately two dozen state DP crime laws are being actively enforced.

Necessary steps

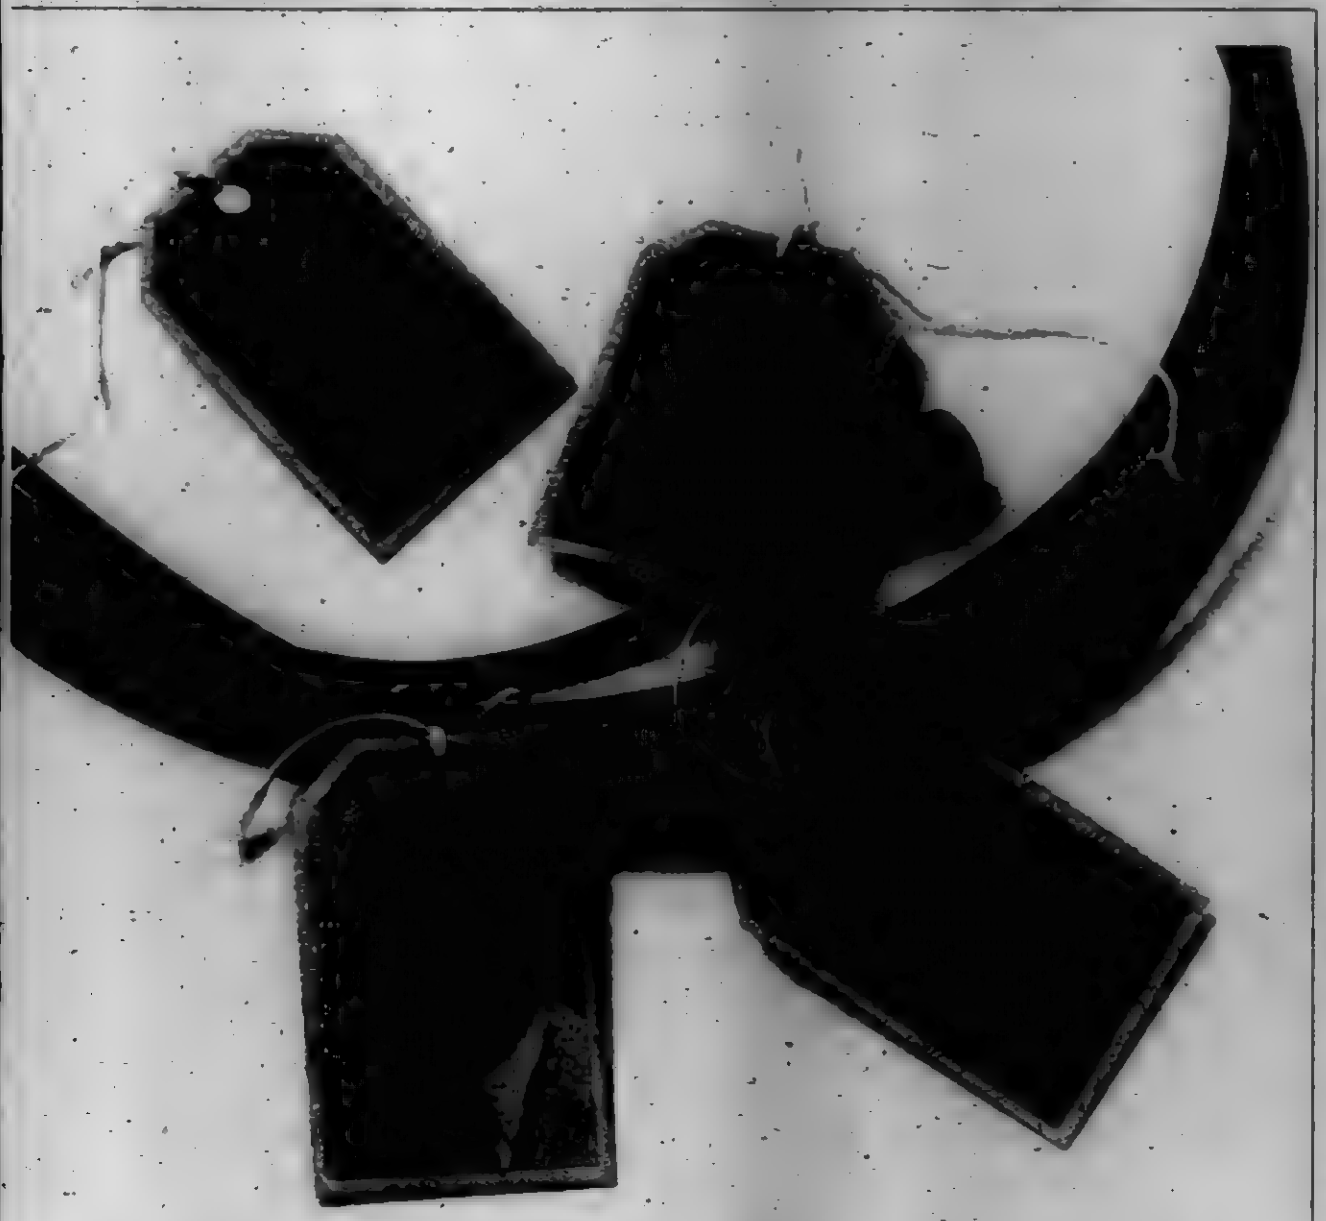
But before enforcement can be effective, she said, a number of steps are necessary, including:

- Information systems must be designed to collect and keep evidence of unauthorized access.
- The systems must be secure so that prosecutors will be willing to prosecute security violators.
- Providers must have a plan to respond to unauthorized accesses.

Steiger also commented that public opinion has to support better security and law enforcement if the problem is to be effectively addressed.

Gary Arlen, president of Arlen Communications, Inc., called for a public education effort aimed at, in order of importance:

- System users. One forum attendee decried "the level of [security] naivete on the part of so many of our customers."
- Legislators. They must be aware of the need for laws against unauthorized access, Arlen said.
- Hackers. They must understand that "we're serious that we don't want this [unauthorized access] going on and will prosecute," he said.
- Employees. A condition of employment, according to Arlen, is that "you can't play with the system."
- Media. Arlen joined with a number of persons at the forum complaining that the media is glamorizing illegal hacking activities.
- Enforcement agencies. They, too, tend to glamorize the arrests they make in unauthorized access cases, he said.
- The world at large. Arlen said society must understand that at the birth of this new industry there are important legal and moral issues that need to be resolved.



EtherSeries" right into our IBM Information Center and can now share disks and printers."
— Dennis Vohs, Executive Vice President, MSA (Atlanta, Georgia)

"We wanted the expandability of 3Com's Ethernet as a base for our networked products. VisiSeries" for EtherSeries" is the beginning of a family which will include VisiOn.""
— Dan Fylstra, Chairman, VisiCorp (San Jose, California)

What EtherSeries will do for you.

Tying into 3Com EtherSeries was a smart business move for these PC software experts. And it can be for you too. You'll maximize office efficiency, now. Cut operating costs, now. And you'll realize the full potential of your IBM PCs using software that is readily available off-the-shelf, now. All for the low price of $795 per link.

EtherSeries is available at leading computer stores. Call or write Cory Randall at 3Com for more details.

Tech innovation to spur info system shift: IDC

CW AT IDC BRIEFING SESSION

By Peter Bartalik
CW Staff

BOSTON — A "clustering" of related technological innovations will produce an "incredible transformation" of information systems potentials over the next two or three years, according to International Data Corp. (IDC).

Speaking here recently at IDC's 19th Annual Information Industry Briefing Session, William F. Zachman, vice-president of corporate research, said the clustering of innovations involving interrelated technologies of information "is creating the conditions for a period of fundamental change over the remainder of the 1980s." Zachman cited 17 areas of emerging technology which "over the next two or three years are going to change profoundly the way we use information systems . . . and over the next 10 to 15 years will change the way we live."

Optical disk storage "is going to be one of the most important technologies over the next five years," according to Zachman. He said optical storage technology will provide inexpensive digital information distribution and a high-capacity static storage that could possibly overtake microfiche.

Another area stressed by Zachman was the development of what he called "mindware." Included in this category are computer-aided intelligence, artificial intelligence, knowledge-based and expert systems, inference systems and computer "advisors."

Zachman predicted the explosion in home computer applications will come with the development of computer systems that "are going to be companions, advisers" that provide counseling to individuals ranging from employment strategies to personal life.

The microprocessor operating system for the late '80s "has not even been designed yet," Zachman said, predicting there "is room for many surprises yet to come."

He also predicted that data base machines will be preferred over data base management systems by the end of the decade and will be very successful in local-area network applications. "We're not far away from seeing networked distributed data base systems, and we're going to see a lot more," Zachman predicted.

Other technological innovations cited by Zachman include fourth-generation 32-bit microprocessors; peripheral and support chips with functions such as controlling disk drives and interfacing to local-area networks; Cmos technology providing low power consumption and low heat generation; 256K-byte random-access memory chips greatly expanding personal computer memory size into the 1M- to 16M-byte range; high-capacity Winchester and floppy disks; flat panel displays; low-cost graphic output devices; networking standards; micro-based multiprocessor systems; and communications processors.

DP managers seen underbudgeting salaries for '84

CW AT IDC BRIEFING SESSION

By Paul Kunsmiller
CW Staff

BOSTON — "Data processing managers have not budgeted enough money for salaries in 1984," said John Wanamaker, senior MIS consultant, at International Data Corp.'s (IDC) 19th Annual Industry Briefing Session held here earlier this month.

Wanamaker cited IDC's "1983 Data Processing Spending Survey" in which 1,000 DP managers projected a 6% average rise in salary allocations for 1984. "We feel that a 6% increase is low," Wanamaker said.

That increase barely matches a 4% increase in staff size that managers forecast. DP departments are growing four times faster than other departments, and "this growth refutes the theory that demand for DP professionals is decreasing," Wanamaker said.

DP costs are shifting toward equipment and away from personnel, the survey found. Personnel costs will drop from 43.8% of the total budget in 1982 to 38.7% in 1984, while equipment costs will rise from 26.2% of the 1982 budget to 28.5% of the 1984 budget.

"Managers are trying to get more bang for the buck," Wanamaker said. DP departments will spend $97 billion in 1984, an increase of $12 billion over 1983.

Equipment costs would be greater if DP departments were paying for microcomputers, but "the cost of microcomputers is being absorbed by user, not DP, budgets," Wanamaker noted. However, DP departments are paying for increased communications costs caused by micro-to-mainframe links. Seventy percent of the managers said that their departments pay communications costs provided to other departments.

Managers estimate that communications expenses will rise 28% in 1984, the largest increase of six spending areas that also include software, staff, hardware, supplies and overhead.

"There are two reasons for the projected rise," Wanamaker said. "First, data processing managers think that the AT&T divestiture will mean rising communications costs, and there will be a large number of new users tying into old equipment."

Software accounts for the second fastest growing expense, with a projected increase of 25% in 1984. Communications costs will account for 9% of the total budget, with software at 8% of the actual budgets.

The survey found that few DP departments charge other departments for use of the mainframe. Seventy-one percent of the DP departments do not charge for their services; only 10% charge for every service.

"It has been extremely difficult for the data processing department to determine computer costs efficiently," Wanamaker said, adding, "There is a correlation between the size of a company and whether the data processing department charges for its services." Fifty-six percent of the companies with income of more than $200 million charge for their services, while only 25% of those with less than $25 million charge users.

GUIDELINE ON ELECTRICAL POWER FOR ADP INSTALLATIONS

A COMPUTER INDUSTRY FIRST!

NOTICE: THIS MILESTONE DOCUMENT HAS BEEN REVIEWED BY MEMBERS OF THE POWER INTERFACE COMMITTEE OF THE COMPUTER BUSINESS EQUIPMENT MANUFACTURERS ASSOCIATION, (IBM ,DEC, BURROUGHS, HONEYWELL, UNIVAC, NCR, CDC, ETC.) AND THEREFORE REPRESENTS A CONSENSUS AMONG THESE POWER EXPERTS.

FEDERAL INFORMATION PROCESSING STANDARDS PUBLICATION

COMPUTER POWER SYSTEMS CORP. A CONTRIBUTOR TO FIPS PUB 94 WILL CONDUCT THESE SEMINARS, TO FULLY EXPLAIN THE TECHNICAL CONCEPTS PRESENTED.

MARCH 29	LOS ANGELES	SEPTEMBER 6	NEW YORK CITY
APRIL 5	DETROIT	OCTOBER 18	BOSTON
JUNE 28	PHILADELPHIA	NOVEMBER 8	DALLAS
JULY 19	CHICAGO	DECEMBER 6	ATLANTA
AUGUST 14	SAN FRANCISCO		

SEMINAR DETAILS WILL BE PROVIDED WITH YOUR RESERVATION

YOU'VE ALL BEEN INVOLVED IN CONTROVERSIES ABOUT

- HOW TO GROUND A COMPUTER?
- HOW MUCH ISOLATION REQUIRED?
- WHAT KIND OF POWER CONDITIONER IS NEEDED?

DON'T MISS THIS UNIQUE OPPORTUNITY!

THIS ONE-DAY SEMINAR COULD BE YOUR BEST INVESTMENT IN 1984!!

☐ ENROLL ME IN _____ (CITY)

☐ ENCLOSED IS MY CHECK FOR $195.00

☐ BILL ME (ENCLOSE BUSINESS CARD)

P.O. BOX 8340, CARSON, CA 90749
213/515-0686 X 237 A. MILLER

NOTICE: PAYMENT IS DUE 10 DAYS PRIOR TO EACH SESSION

Forth meet set for June 6-9

ROCHESTER, N.Y. — The 1984 Rochester Forth Applications Conference will be held here June 6-9 at the University of Rochester.

Sponsored by the Institute for Applied Forth Research, the conference will focus on real-time systems, including such areas as process control, data acquisition, smart instrumentation, laboratory systems, computer vision, spacecraft navigation, music synthesis and voice recognition.

A call for papers has been issued on the following topics: real-time software; Forth applications, including but not limited to real-time, business, medical, space-based, laboratory and Forth microchip applications; and Forth technology, including finite-state machines, control and data structures and hybrid hardware/software systems.

Registration is $300. Full-time students may register for $150. Further information is available from the Institute for Applied Research, 70 Elmwood Ave., Rochester N.Y. 14611.

IBM doesn't have micro mart sewn up: IDC

Thirteen computer industry predictions offered for 1984

CW At IDC
Briefing Session

By James Connolly
CW Staff

BOSTON — The final decline of the IBM 360, 370 and 3080 series machines was one of 13 computer industry predictions for 1984 offered by International Data Corp. (IDC) at its 19th Annual Information Industry Briefing Session here recently.

The predictions, assembled by the Framingham, Mass.-based IDC consulting staff, were outlined by IDC Vice-President of Technology Assessment William F. Zachmann.

Other key predictions centered on Apple Computer, Inc. and Tandy Corp., providing IBM with greater than anticipated competition in the microcomputer field and on AT&T facing a possible "bath of red ink" in 1984.

The predictions included the following:

■ "The proclamation of dominance of the IBM Personal Computer by many in the media last year will prove to have been premature." IBM likely will introduce a high-end Intel Corp. 286-based system and other products, but faces competition from IBM-compatible manufacturers, Apple and the Tandy 2000.

■ "Apple blossoms in 1984." The Macintosh and Lisa II are likely to sell well.

■ "Rough sledding for AT&T." AT&T Information Systems, Inc. will introduce workstations, small processors, enhanced telephone switches and networking products, but could face a "bath of red ink" while competing with established computer companies. AT&T Technologies and AT&T Communications also face fierce competition and/or regulatory problems.

■ "The home market will prove to be both more significant and [more] demanding of capable systems than many expect." There is clearly a substantial market for professional and business computers at home.

■ "There will be many new [Cmos] processor and memory announcements from various vendors in 1984." Cmos requires less power and generates less heat than technologies used until now. New products will include 64K-byte chips and, "quite likely," 256K-byte versions.

■ "Important new tech." Optical disks will be used with a number of interactive video games and tutorial software.

■ "The final decline of the IBM 360, 370 and 3080 [series machines] will begin in 1984." The architecture will feel the pressure from supercomputers above, minicomputers and personal computers below and from IBM itself, which is due for a new line of processors.

■ "More multiprocessors will be introduced in 1984." Some of the best buys for users in 1984 will be new offerings such as networks and specialized systems from multiprocessing products manufacturers such as Stratus Computer, Inc. and Synapse Computer Corp. and from start-ups and established vendors.

■ "There will be growing importance for data base machines." Nineteen eighty-four will be the year they begin to achieve a significant level of user familiarity and acceptance. Most will be based upon a fundamentally relational data model.

■ "Ada will come into prominence in 1984." The structured language will play a role beyond the embedded military systems for which it was designed and is seen as a "superior alternative" to Cobol, Fortran and PL/I.

■ "The IEEE 802 local-area network standards will emerge as a significant force in the industry in 1984." The baseband CSMA/CD (802.3) and the broadband token bus (802.4) standards will be approved and will appear in products during 1984.

■ "There will be no clear-cut sweep for Unix in 1984." Unix is of some importance, particularly for programmers, but is not an ideal system for end users.

■ "The present semiconductor parts shortage will prove ephemeral." The shortage of popular microprocessors should disappear by midsummer, when temporary hoarding and overordering end. Major vendors may find they do not need as many chips as they anticipated, and semiconductor prices may drop by next fall.

The briefing by the market research firm was held here at the beginning of the month. It was repeated last week in Arlington, Va., Chicago and Dallas and will be given again this week in Los Angeles and San Jose, Calif.

"dBASE II helps keep us on our toes."

Robert Hubert
Marketing Director
The Boston Ballet

"The Boston Ballet was a company in search of a computer when I joined the organization earlier this year. And, after discovering that a large computer system was being considered, I urged a smaller, more sensible first step.

"Since almost no one at The Boston Ballet had any previous computer experience, I strongly recommended the purchase of a microcomputer and dBASE II.

"dBASE II, the relational database management system from Ashton-Tate, would give the people in the Company the time and the opportunity to get used to computing before bringing in a larger, more expensive system later on.

"dBASE II is a command-driven, highly flexible system that can be used for a great variety of applications ranging from very simple to highly complex."

A premier performer from Day One.

"dBASE II manages our extensive season subscriber mailings; keeps track of all our advertising insertions, costs and efficiency; and makes project time management a snap. We are now making plans to use dBASE II in handling the special promotions and manpower analyses critical to our day-to-day management.

"dBASE II made an immediate and sizeable impact on the efficiency of our operation."

The real kicker.

"Recently, we hired a custom systems house to develop a long-range computer program for The Boston Ballet. Without prejudice, they came back and said the new system should be based on dBASE II."

dBASE II can provide you with virtuoso performance, regardless of your application.

For more about dBASE II, contact Ashton-Tate today. 10150 West Jefferson Boulevard, Culver City, CA 90230. (800) 437-4329, ext. 217. In Colorado (303) 799-4900. In the U.K. (0908) 568866.

ASHTON·TATE

dBASE II is a registered trademark of Ashton-Tate.
Suggested retail price for dBASE II is $700.

Integration called best communications tack

CW AT IDC BRIEFING SESSION

By Lynn Haber
CW Staff

BOSTON — With the advent of divestiture, end users are facing tough questions on new options and opportunities for communications network development. Major risks and confusion lie in the forefront of this change, but beyond are opportunities for both users and vendors, an industry expert told his audience at an industry briefing held here recently.

"The key word for networking and communications in the year ahead is 'integration,' which goes well beyond networking, beyond putting pieces of hardware together. It involves system integration at all levels and functions," said Kim Myhre, senior researcher in communications for International Data Corp. (IDC) of Framingham, Mass., which sponsored the briefing. "What we will hear more about is hardware, software and communications and putting those elements into useful and manageable information systems."

Myhre looked at the impact of changing technologies on communications in a talk on "Trends in Communications and Networking" at IDC's 19th Annual Information Industry Briefing Session here earlier this month. The briefing was repeated last week in Arlington, Va., Chicago and Dallas; it will be held this week in Los Angeles and San Jose, Calif.

According to Myhre, one of the greatest effects of the AT&T divestiture and deregulation is general increased competition in the communications area — specifically, competition between AT&T and IBM. Areas of potential IBM-AT&T competition include office automation, personal computers, data communications equipment, local-area networks, value-added network services, transmission services and home information markets.

"The most promising result of competition as characterized by AT&T and IBM will be the availability of new technology products and service options," Myhre said. "Competition will create new areas of opportunity for suppliers of information processing products and services and will inspire the development of new approaches and technologies for communications networking."

The development of new networking alternatives includes long-haul, metropolitan bypass and on-premises or local-area networks, Myhre said. Long-haul alternatives include satellite, microwave, packet-switching and fiber-optic technology.

"In all of these cases," Myhre said, "the purpose is to offer both public and private communications users an alternative to the traditional, leased-line public telephone service."

According to Myhre, despite the fact that bypass technology has received a lot of attention over the past year, "This is an area where alternatives to the local phone network are still not readily available or price-competitive." Some bypass technology includes digital termination systems, cellular mobile radio and two-way CATV.

According to the speaker, there has been an explosion in local-area network technology due to the "growing interest by business for provision of high-speed distributed data communications and fully integrated office automation systems." With increased interest in [local-area networks] by business, specific organizational needs and requirements, not technology, will define and drive the market. "[Local-area nets] rest in the hands of the users," Myhre said. And to accommodate potential new customers, vendors are leaving all options open, he added.

The anticipated growth of the local-area network market is expected to increase from 26,000 installed local-area nets in 1983 to 103,000 networks in 1988. The dollar value of local-area networks is expected to increase from $400 million in 1982 to $2 billion in 1988.

The fundamental question that still needs to be addressed by both vendors and potential users of local-area nets is: Why use a local-area network? Myhre cited three cases for local-area nets:

- They can often provide a more flexible means of handling terminal-to-computer communications.
- Local-area network implementation can be a cost-effective solution to facilitate resource sharing, particularly with the proliferation of personal computers.
- Local-area network facilities provide the backbone for the development of fully connective, high-speed, distributed resource systems.

Issues in local-area network market development that still need to be resolved, according to the speaker, include implementation and applications, compatibility, gateways, standards, pricing, distribution channels and private branch exchanges.

TIME
Your Most Precious Resource

In any business, time is money! This is especially true when dealing with Data Communication Networks where system performance and RESPONSE TIME is critical to the user.

Degradation of system performance (responsiveness) is inevitable as customer work loads increase. Installing faster, more sophisticated hardware is a popular but temporary solution. It is only a matter of time until the problem reappears.

Questronics offers a solution through statistical performance analysis of your system. Over seventy-five categories of line utilization and response time information can be generated in eleven different reports (hard copy and/or data based).

Questronics model CPA/7 is setting the standard in the industry by providing vital performance statistics in the areas of:

- User/System Response Time
- Line Utilization
- Character Transmission Counts
- Transmission Errors
- Host Resident Time
- Network Transmission Time
- Polling Counts
- Poll List Wrap Time
- Histograms
- Alarm Conditions

Utilizing this information, DataCom managers can then make the crucial decisions necessary to fine tune and balance the network. Each line may also be further refined to greater efficiency, enabling planning and projection for new growth.

Call Questronics and discuss your situation. We'll give you straight answers.

System helps astronomer link physics theories

By Edward Warner
CW Staff

CAMBRIDGE, England — At the juncture where two of the major and most contradictory theories of physics meet sits British astronomer Stephen Hawking. Hawking specializes in research into black holes, rare celestial bodies with great mass — one is supposedly five times as heavy as the sun, but only 20 miles in diameter — and gravity so strong they absorb everything around them, including light.

To aid Hawking's research at Cambridge University here, Charles River Data Systems, Inc. of Framingham, Mass., recently donated to Hawking a Universe 68/36 superminicomputer. The system, which includes a 32-bit processor with 1M byte of internal storage and a 36M-byte Winchester disk storage unit, will be used to aid the calculations involved in Hawking's latest project: bringing together Albert Einstein's theory of general relativity and the theory of quantum mechanics, two ways of viewing physical events that once got along very poorly — that is, until Hawking started studying black holes.

General relativity holds that the presence of matter actually curves space in the vicinity of that matter. Put another way, under general relativity, nothing could escape from a black hole — the most dense item of matter in the universe — because space around it would be too curved.

If nothing could escape from a black hole, "then the laws of quantum mechanics would tell you it would have no temperature," explained Princeton University theoretical physicist Malcolm Perry, who is also researching the black hole phenomenon. To have no temperature, he said, defies the laws of quantum mechanics, a branch of physics which attempts to explain the behavior of atomic particles.

Hawking, however, found that black holes were emitting something — particles of matter possibly formed by the tremendous pressure of the black hole's gravity on its own energy.

The intensity of the movement of those particles could be measured as a temperature, explained David Smith, associate editor of *Sky and Telescope* magazine. And the existence of a temperature reading in a black hole, he said, meant that in the black hole, both general relativity and quantum mechanics might apply.

For Hawking to produce an acceptable theory explaining the coexistence of general relativity and quantum mechanics "would be a major breakthrough," on par with Einstein's work, Smith said.

The computer will aid Hawking's calculations in two areas, explained Larry Kirsch, product marketing manager for Charles River Data Systems. The greatest assistance, he said, will come from the Universe 68/36's ability to run symbolic reductions of mathematical expressions, something that will speed Hawking's efforts. Kirsch also said simulation software, modeling various explanations for Hawking's findings, will likely be run on the system as well.

Ideally, it would be Hawking himself who could best explain his work and the uses he plans for the new equipment. Confined to a wheelchair since his days as a graduate student, Hawking, now 42, has seen the degenerative nerve disease which afflicts him steal his speech and movement — but not his mental sharpness. Now one of the world's foremost astronomers, the subject of profiles in *Omni* and *The New York Times Magazine*, he speaks through an interpreter.

With his son Robert as interpreter, Hawking said any breakthrough in combining what he called the two major theories of this century is still "a long way off, [though] we've made quite a lot of progress."

Group to fete math discovery

LOUISVILLE, Ky. — The Fredkin Foundation will award a $100,000 prize for the first computer to make a major mathematical discovery.

Carnegie-Mellon University in Pittsburgh has been named trustee of the Fredkin Prize for Computer Discovery in Mathematics, according to Raj Reddy, director of the university's Robotics Institute and a trustee of the International Joint Council on Artificial Intelligence.

The prize will be awarded "for a mathematical work of distinction in which some of the pivotal ideas have been found automatically by a computer program in which they were not initially implicit," Reddy said.

Dr. Woody Bledsoe of the University of Texas at Austin, president-elect of the American Association for Artificial Intelligence, will head a committee of mathematicians and computer scientists who will define the rules of the competition.

"The 128 channel UNIMUX™ from Fibronics has the power to solve your trunking and multiplexing problems."

IN A GROWTH MODE? REORGANIZING YOUR INFORMATION TRANSFER SYSTEM? Now is the perfect time to learn about the cost-effective features of UNIMUX, Fibronics' universal time division multiplexer.

The UNIMUX eliminates the need for line drivers, avoids noise problems, and offers EMI, RFI, and EMP immunity.

- Expandable from 4 to 128 v.24 or v.25 ports
- Full duplex, high speed communications to 64 KBPS (RS-232C or v.35)
- Synchronous/Asynchronous operation, each channel independent
- Communicates over one fiberoptic or coaxial cable
- Built-in test diagnostics with status indicators

BOOK REVIEWS

THE AI BUSINESS: THE COMMERCIAL USES OF ARTIFICIAL INTELLIGENCE

Edited by Patrick H. Winston And Karen A. Prendergast

Most arguments for the eventual commercial usefulness of artificial intelligence point to the familiar expert systems such as Caduceus, the medical diagnosis experiment, or Dipmeter Advisor, an oil field log interpretation aid. This MIT Press book relies on the same two examples to show that AI can move from theory to practice, from research labs to business offices. New examples are needed to make the case for AI among the venture capitalists who often determine which technologies will fly and which will creep into the future.

Roundtable discussions are interspersed among chapters written by experts about the research they pursue. It's a stellar lineup, including Marvin Minsky and Patrick Winston writing on the MIT Artificial Intelligence Laboratory; Larry Harris, president of Artificial Intelligence Corp., explaining what his Intellect product does, how it does it and the ways this technology will affect data processing; and Arnold Kraft, describing Xcon (expert configurer), the tool developed at Digital Equipment Corp. to help in the complex configuring of VAX systems.

The AI Business covers four areas: expert systems, work and play, robotics and today and tomorrow. Making money in AI comes under the "today and tomorrow" heading, probably more tomorrow than today.

Under "work and play," Atari Corp. Chief Scientist and Vice-President Alan Kay assesses the languages of AI. About Lisp: "It is the longest standing, good programming language precisely because it can be molded into so many different things."

About the only other AI language mentioned: "Prolog, during the first half an hour or couple of hours that you are a novice, does absolutely magic things. But it is doing these things without your having had to understand anything about what is going on inside Prolog. Then, suddenly, in order to do something real, you have to understand everything about Prolog."

Hardcover, 324 pages, $15.95, ISBN 0-262-23117-4, The MIT Press, 28 Carleton St., Cambridge, Mass. 02142.

TALKING CHIPS: IC SPEECH SYNTHESIS

By Nelson Morgan

Speech synthesis, says the author, will go a long way toward making the human-computer interface more comfortable — at least to the human. From the computer's perspective, simulating the human voice box requires enormous computational power formerly found only on special-purpose mainframes.

Then came the "talking chips" — integrated circuits capable of using the well-known algorithms that model speech. Familiar is the toy that talks; more sophisticated are the systems displayed at Texas Instruments, Inc. and Digital Equipment Corp. booths at computer conferences. They draw crowds of passersby fascinated by the possibility of a human in conversation with a machine. *Talking Chips* focuses on speech synthesis, while noting in passing its complementary technology — voice recognition.

Morgan demonstrates a command of the subject ranging from the die area of the silicon to the mathematical models and the basics of sound however it is produced, interpreted and understood. The book is not an overview but, rather, a technical description of speech synthesis written in an offbeat style. (Morgan pictures himself on the book jacket as a convict with an "author" sign hanging across his chest.)

Speech synthesis is complicated by the varying types of sound produced by humans: voiced sounds (all vowels and many consonants) such as "ee" and unvoiced sounds (many consonants) such as "ah." Algorithms, Morgan says, are still far more developed than the hardware capable of implementing them.

Hardcover, 178 pages, $24.50, ISBN 0-07-043107-8, McGraw-Hill Book Co., 1221 Ave. of the Americas, New York, N.Y. 10020.

A MANAGER'S COMPLETE GUIDE TO EFFECTIVE INFORMATION SYSTEMS

By Robert J. Thierauf

Questioning the way things are can show how far the information systems organization is from the way things should be. The author presents "a questionnaire approach," hundreds of questions on master plans, contingency controls, personnel and performance standards, computer access, equipment logs — and that's just part of questionnaire one.

Questionnaire two targets application controls, asking about verification methods, validation checks, error routines, data base controls and so on. This style forces the reader to reflect on how he manages his department. Once you start answering questions, you don't stop.

To give the reader perspective on his responses, the book presents the composite answers of nine small and nine large companies to the same questions. There is also ample elaboration on what a manager's responses show about the health of his organization.

Hardcover, 294 pages, $33.95, ISBN 0-02-933060-3, The Free Press, Macmillan Publishing Co., Inc., 866 Third Ave., New York, N.Y. 10022.

BOOKS OF NOTE

TUTORIAL ON ROBOTICS, edited by C.S.G. Lee, R.C. Gonzalez and K.S. Fu: paperback, 573 pages, $24 (nonmembers, $39), ISBN 0-8186-0615-4, Institute of Electrical and Electronics Engineers Computer Society Press, Suite 300, 1109 Spring St., Silver Spring, Md. 20910.

SYSTEMS RELIABILITY, MAINTAINABILITY AND MANAGEMENT, by Balbir S. Dhillon: hardcover, 271 pages, $29.95, ISBN 089433-195-7, Petrocelli Books, Inc., 1101 State Road, Princeton, N.J. 08540.

ROBOTS IN MANUFACTURING: KEY TO INTERNATIONAL COMPETITIVENESS, by Jack Baranson: hardcover, 152 pages, $32.50, ISBN 0-912338-39-3, Lomond Publications, Inc., P.O. Box 88-S, Mount Airy, Md. 21771.

Publishers wishing to have their books considered for review can direct books, prepublication galleys, press releases, catalogs or other information to George Harrar, Book Review Editor, Computerworld, P.O. Box 880, 375 Cochituate Road, Framingham, Mass. 01701.

Urisa nominations accepted

ST. LOUIS — The Urban and Regional Information Systems Association (Urisa) is accepting nominations for its Exemplary Systems in Government Awards program.

The annual Urisa awards recognize extraordinary achievement by government agencies in the use of automated information systems. The competition is open to all government agencies at the federal, state, regional, local and provincial levels.

Areas of interest include administration and finance, hospitals, human services, libraries, physical and economic development, planning and zoning and public safety.

Deadline for nominations is April 15. More information is available from Charles Kindleberger, St. Louis Community Development Agency, 317 N. 11th St., St. Louis, Mo. 63101.

IEEE medal goes to RCA exec

PHILADELPHIA — RCA Senior Vice-President Dr. James Vollmer has received a Centennial Medal from the Institute of Electrical and Electronics Engineers (IEEE) for exceptional service to the profession.

One of 1,984 people in the U.S. to receive the award, Vollmer is in charge of evaluating competing technologies and establishing strategic technological approaches for all of RCA's businesses. He is the company's primary interface with U.S. aerospace and defense agencies.

The IEEE's Centennial Medal commemorates the 100th anniversary of that organization.

David
Recommends The Diablo 630 Series

David Jamison Carlyle recommends the Diablo 630 Series.

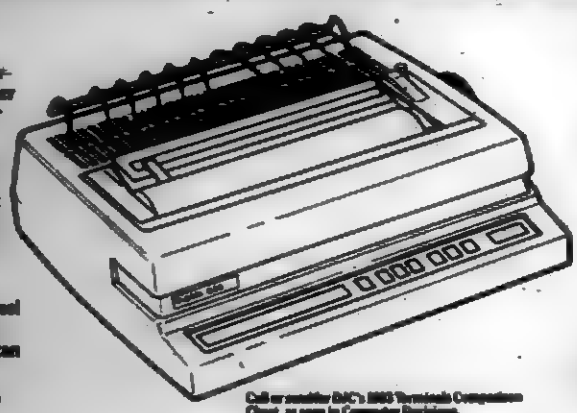
The most versatile line of daisy wheel printers for serious business applications.

630 API—The API's unique all purpose interface makes this 40 cps printer compatible with almost any computer you can name.

630 ECS—All the features of the 630 API plus the ability to print 192 fully formed characters and construct hundreds more. Perfect for scientific, financial, legal and other applications where special symbols and text are needed.

630 ECS/IBM—The only daisy wheel on the market that can truly print any character or symbol that the IBM PC can display.

Diablo from DJC, the first name in peripheral distribution.



Call or mail for DJC's 1983 Terminals Comparison Chart, as seen in Computer Decisions.

Organizations urged to take formal route to micro training

By Robert Batt
CW West Coast Bureau

LOS ANGELES — Organizations must take a more formal approach to microcomputer training if the substantial investment in hardware and software is to be justified.

That was the main theme of a paper presented here at the recent 1984 Office Automation Conference (OAC) by Steven Riccabona, president of Systec Resources Corp., and Ralph Vincarra and Kathleen McConkey, senior designers from the same firm. Systec is a Marina del Rey, Calif.-based information systems consulting firm.

In the training programs for micros, the trio told the the American Federation of Information Processing Societies, Inc.-sponsored conference, companies must ensure that:

- All of the employees who will be using personal computers receive appropriate training on both microcomputer fundamentals and the specific microcomputer hardware and software they will be using.
- The training received by employees is effective, so that the productivity gains offered by micros are realized.
- The training is designed for the unique requirements of each user group.
- The administrative effort required to coordinate all personal computer training activities is minimized.

Planning vital

"Careful planning is a vital ingredient in a successful training program. A thorough, well-documented training plan, coupled with a commitment to implement that plan, is the cornerstone in a successful overall program dedicated to using microcomputers to improve productivity," the paper stated.

According to the authors, training should be tailored to meet the needs of the group that is being trained. There are three broad-based groups that need micro training — managers and executives, other professionals and clerical staff.

Regardless of whether they will actually be using micros themselves, managers and executives have a need to understand how personal computers can impact those departments and people for which they are responsible, the authors asserted.

In addition to the operational factors, the authors noted, micros can have a significant impact on the work habits and the traditional working relationships between employees. "Managers and executives need to understand this social impact of microcomputers in the office," they warned.

"To accomplish these objectives, training for professionals must provide both hands-on practice operating the system and case study exercises which help the professional develop a conceptual understanding of how the system can be applied to his process-oriented work," the Systec consultants concluded.

UDS raises the speed limit for dial-up modems

At last there's a 9600 bps modem designed especially for the dial-up telephone network.

Our 9600 A/B is the ideal modem for projected system growth. Realize immediate line-charge savings by moving from 208 A/B to 9600 A/B now! Then, if your system demands dedicated lines, simple strap modifications will convert your modems. Nothing else changes!

A faster turnaround time than 208 A/B's further increases the 9600 A/B's efficiency. Multiple test modes are selectable from the front panel.

Ecuador uses network to aid in general election

By David Gleves
CW Staff

QUITO, Ecuador — When presidential elections were held here in the past, it took weeks until the last paper ballots from remote communities were counted. And even then, the outcome was sometimes marred by charges of vote fraud.

In the general election on Jan. 29, however, the government of this Nevada-size country used a data processing network that allowed votes to be tallied much more quickly. "It was a good experience, and we are very much encouraged that this will be used in the future," said Antonio Mancheno, vice-consul of the Ecuadoran Consulate in New York.

Besides counting votes, the system — supplied by Burroughs Corp. and General Datacomm Industries, Inc. — was used for creating a data base in which voter registration information could be stored and retrieved. The data base resided in a Burroughs B1955 mainframe at the Supreme Electoral Tribune headquarters here in the capital city of Quito, according to Jim Nodine, the general manager for Burroughs' Ecuadoran distributor.

Ten cities linked

Ten cities across the nation were linked to the mainframe in Quito via telephone lines, dedicated microwave, local-area network or two-way radio, a General Datacomm spokesman said. Burroughs' ET 2000 and ET 1100 terminals and printers were installed at those sites. Paper ballots were transported from local polling places across the country to those 10 cities, where the results were entered into the system.

The data base also enabled election officials to print out voter lists, to verify and update registration information and to certify that citizens had complied with the country's mandatory voting requirement, Nodine said.

The voter lists were provided to newspapers for publication, and citizens could check the lists for any errors. Any corrections were then entered into the data base, and a final voter list was prepared.

"With the old method, we would have the first counting in a couple of days," Mancheno said. But in faraway provinces, "it would take a week, two weeks or maybe more" until the results were in.

That provided plenty of opportunity for political shenanigans. "We have had a lot of trouble and confrontation between political parties," Mancheno said, referring to the country's past problems with election fraud. He indicated that even with the new system, there have been some complaints about election procedures.

Mancheno said his government believes, however, that computerized elections may help alleviate some of those past troubles. "We are trying to make [elections] simpler, faster and safer."

General Datacomm, a Danbury, Conn., data communications firm, supplied its model DC 2020 short-haul modem and models DC 9600 and DC 9600-QP long-haul modems for the network.

Just two weeks before the election, when the equipment was being assembled in Quito for the first time, it was discovered that some incorrect parts had been ordered.

Additionally, other system components, which had been shipped disassembled from the U.S. in compliance with Ecuador's import regulations, never arrived at their targeted destination, according to a General Datacomm spokesman.

Replacement parts were ordered and shipped to Quito. All 10 cities in the network were linked to the central election office during the next 1½ weeks in an around-the-clock operation that was completed just four hours before election day, the spokesman said.

AUSTRALIA

SOUTH MELBOURNE — Following the evaluation of three major electronic funds transfer systems, the State Bank of Victoria has taken a different path from the Westpac Banking Corp. and the ANZ Banking Group Ltd., which both chose Tandem Computers Pty. Ltd.'s redundant Nonstop systems. The Bank of Victoria instead purchased Quadstar Corp.'s Quadstar, which runs on IBM Series/1 machines.

■

MULGRAVE — Franklin Mint Pty. Ltd. has become the first Australian user of the IBM plug-compatible Nixdorf Computer Corp. 8890 system. Franklin expects to realize annual savings of about $84,000 when it stops using ACI Computer Services' IBM-based service bureau in favor of the in-house Nixdorf system.

■

PHILLIP ISLAND — Digital Equipment Corp. reportedly upset users here with its decision to scrap its 36-bit project. Les Stirzaker, senior systems programmer at Melbourne's Deakin University, claims that in order to run the next release of the Dec-system-20 operating system, most sites will be forced to buy more expensive memory and additional hardware. The release is expected to be available later this year.

BELGIUM

BRUSSELS — During a recent meeting here, European Common Market ministers gave their stamp of approval to a five-year, $1.3 billion plan to challenge U.S. and Japanese domination of Europe's advanced information technology market. The plan has been dubbed Esprit, which stands for the European Strategic Program for Research and Development in Information Technology. The funds earmarked for the project will be distributed among the 10 Common Market governments and private industry.

FRANCE

PARIS — The French state-owned electronics group, Cie Generale d'Electricite (CGE), has reportedly been shopping for telecommunications partners in the UK. According to CGE's managing director, Georges Pebereau, negotiations are under way with British General Electric Co. (no relation to the American General Electric Co.) and Plessey PLC.

■

PARIS — France's two largest credit card organizations, Carte Bleue and Credit Agricole, have reached a joint distribution and marketing agreement for a single payment card featuring smart-card technology. The Smart Stripe Card will be embedded with a microchip and magnetic stripe to facilitate a host of financial transactions.

JAPAN

TOKYO — Fujitsu Ltd. has developed a stacked capacitor-type dynamic random-access memory. The circuit is said to offer improved packing density and larger storage capability.

WEST GERMANY

FRANKFURT — Nixdorf Computer AG plans to enter the stock exchange here. "The company wants to place 20% of its capital stock in the form of preference shares on the stock exchange in May or June," Chairman Heinz Nixdorf said.

Pica offers tech support to nonprofit groups

By Lynn Haber
CW Staff

WASHINGTON, D.C. — A young computer association here is helping nonprofit public interest groups utilize computer technology to organize their offices and implement their social and political strategies on Capitol Hill.

The Public Interest Computer Association (Pica), founded by Marc Rotenberg last April, is a network of microcomputer users in the public interest community. Some of Pica's 85 member organizations include the American Civil Liberties Union (ACLU), Arms Control Computer Network, Center for International Policy, Children's Defense Fund, National Organization for Women (NOW) and the Technology Research and Action Center.

"The two objectives of Pica are to provide assistance to nonprofit organizations on how computers can be utilized in their public interest work and to provide discussion to understand the social impact of computers," said Rotenberg, a 24-year-old Harvard graduate with a background in computer science and philosophy.

The association relies on the willingness of member organizations to work with one another and to network their skills and resources. Pica sponsors monthly seminars, classes and workshops; produces a bimonthly publication; and maintains a resource center where computer-related literature, product information and application guides are housed. It also sponsors users groups for micros as well as a consultants' group for computer professionals who work with nonprofit organizations.

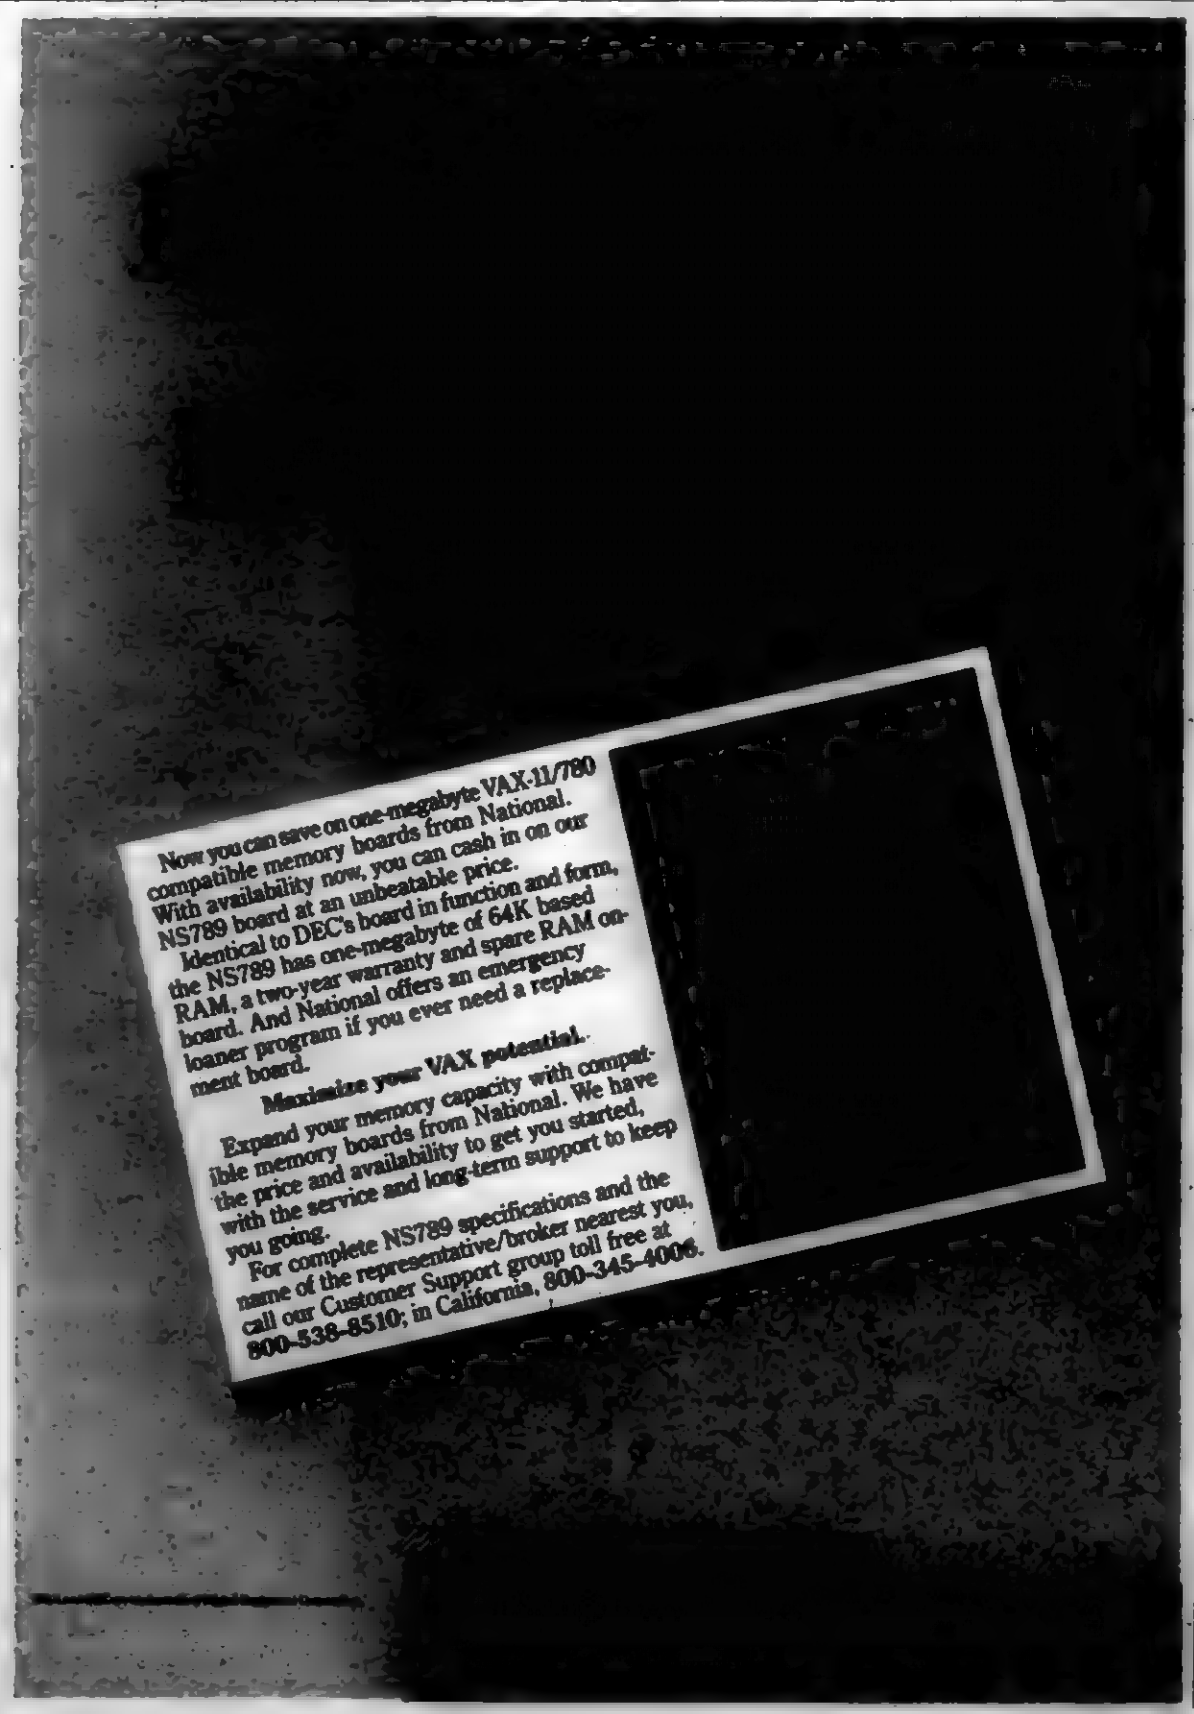
The idea for Pica occurred to Rotenberg while he worked with the Center for National Security Studies here. "As I spoke with more organizations about the type of work they wanted to do with small computers, it seemed appropriate to try to establish a way of getting people to contact one another so they could assist each other in development," he said. "In many cases with small nonprofit organizations, if you're buying a small computer, you can't afford a consultant, but you certainly need some assistance. We've tried where possible to get people in touch with others who are doing similar projects."

Last year, for example, Pica and the ACLU coordinated a computer-matching program to determine the extent of human rights violations in El Salvador.

NOW uses micros for both internal office applications, such as payroll and personnel records, and for the organization's political work. According to a NOW spokeswoman, the group subscribes to Legi-Slate, an information service that provides news about legislative activity to microcomputer users. The service helps NOW keep track of bills, sponsors and the voting records of politicians.

Since the establishment of Pica last year, more and more nonprofit public interest groups have expressed interest in learning how computer applications can aid them. Many, however, have operating budgets that don't leave room for the purchase of microcomputer systems, so Rotenberg has been talking with computer companies to try to establish access to computer resources.

According to the Pica founder, Apple Computer, Inc. of Cupertino, Calif., presently has the most extensive community grants program of which he is aware. "We wanted to go beyond an individual organization using a computer," said Mark Vermillion, manager of community affairs for Apple. "We were looking for something a little bit more exciting, so we developed this program for microcomputer networking in which we seed microcomputer networks among nonprofit groups for the purpose of sharing information and being more effective."



QED courses to span U.S.

WELLESLEY, Mass. — QED Information Sciences, Inc. will offer over 150 courses across the U.S. from now through June. Among the course topics are systems design, systems analysis, structured methodologies, ergonomics of the automated office, leadership, effective presentations, conflict management and managing and influencing people.

QED, also a publisher of books, monographs and educational software, has regional learning centers here in Wellesley; Teaneck, N.J.; Philadelphia; and Dallas-Fort Worth. QED instructors are also conducting courses under special arrangements in Washington, D.C.; St. Louis and Richmond, Va.

A catalog providing course outlines, schedules, locations and fees is available through QED Information Sciences, P.O. Box 181, 180 Linden St., Wellesley, Mass. 02181.

Banks embracing videotex to cut expenses

By Paul Kassakowski
CW Staff

Banks are beginning to look seriously at videotex home banking applications to cut expenses. "Processing a check costs at least $1.02," said Robert I. Lipp, senior executive vice-president at Chemical Bank Corp. in New York. "Electronic processing would cut the cost to 35 cents."

And, according to Lawrence Hemmen, senior vice-president at Manufacturers National Bank, Inc. in Detroit, "In addition to cost benefits, home banking reduces a bank's dependency on its branch network and paper processing."

Before banks can realize the benefits of home banking systems, however, videotex systems and home banking applications have to be developed. "Home banking applications are two or three years away from being fully developed," Hemmen said.

Competition hot

Competition to develop a home banking application is heating up. Chemical Bank, the nation's sixth largest bank, has developed Pronto and sold licensing agreements to eight other banks, including Manufacturers National. Pronto allows Apple Computer, Inc., IBM and Atari Corp. microcomputer users to complete home banking functions such as balance inquiry, bill paying, funds transfer and electronic check register.

"Although the system doesn't require an intelligent modem, it works better with one," said Mark Holthouse, vice-president at Chemical Bank's Electronic Banking Division. Pronto runs on Chemical Bank's Tandem Computer, Inc. Nonstop II system and utilizes Tymshare, Inc.'s Tymnet network, which allows the eight user banks to transfer data to and from the supermini.

For $12 a month, a user receives a program diskette or cartridge and documentation. Because Pronto is in its pilot phase, the eight user banks are limited to 200 customers each "to ensure that communications protocols are in place and each bank can easily install the system," Holthouse explained.

Implementing a home banking system is an expensive proposition. "A bank spends approximately $250,000 for this system," Holthouse said. Chemical Bank is charging $25,000 for one CPU license, $4 per customer and $1,500 for a communications interface to each host computer. Each bank pays its own Tymnet communications charges.

The system won't become cost-efficient until each bank has 15,000 to 20,000 users, according to Holthouse. "A major benefit is the number of new customers the system attracts," he added.

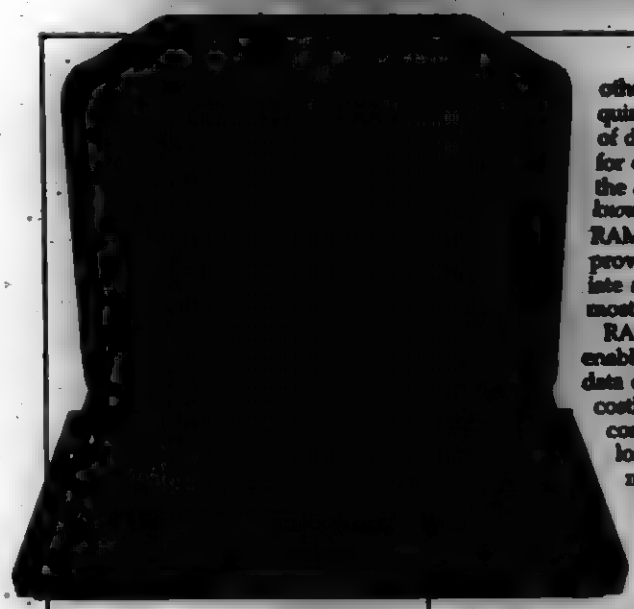
One Pronto licensee, Bankers Trust of South Carolina, Inc. in Columbia, S.C., placed an advertisement in a local newspaper to attract Pronto users. "We hoped that 150 people would express an interest in the system," said Kathy L. Nave, marketing officer. "We received more than 600 inquiries."

Pronto's limitations discouraged some potential users. A user can pay only those merchants who have an account on the system. "Some credit cards can be paid, but many vendors are not part of the system," Holthouse said. "A customer still needs a checkbook."

Bankers Trust opened its system to businesses in the area. "Approximately 50 businesses expressed interest in the system," Nave said. "Only very small businesses, those that use only a checkbook to balance their books, can use the system."

Holthouse said Chemical Bank plans "to enhance the system in the future and add applications and functions."

WITH RAMIS II ENGLISH, THE COMPUTER HAS FINALLY LEARNED YOUR LANGUAGE.



Now, you can talk to your computer the way you talk to a colleague: in plain English.

Even if you've never been on speaking terms with a computer, RAMIS II's advanced knowledge-based technology lets you ask questions, obtain answers, even create reports in only a few minutes. As a result, you can work more effectively and productively—without having to learn a specialized computer language. You just use English.

RAMIS II: ARTIFICIAL INTELLIGENCE THAT DELIVERS REAL PRODUCTIVITY.

RAMIS II English combines years of research by Mathematica in linguistics and artificial intelligence with proven expertise in developing practical, easy-to-use software products. The result is maximum fluency with minimum demands on support staff. In fact, while other systems require days or weeks of dictionary setup for each application, the *extensive built-in knowledge base* of RAMIS II English provides immediate access to most data.

RAMIS II English enables you to access data directly, without costly and time-consuming downloading or reformatting, so the latest information is always available.

Wherever your data is stored—in RAMIS II databases; in ADABAS, IMS, TOTAL, or IDMS databases; or in VSAM or sequential files—there's only one language you need to know: English. And, because English comprehension is an integral part of RAMIS II, you have full access to all of its fourth-generation capabilities, from powerful reporting and analysis to full color business graphics.

THE BENEFITS OF RAMIS II ENGLISH SPEAK FOR THEMSELVES.

Teaching the computer to speak your language is the best way to put the vast power of today's computer systems directly into the hands of *every* user from *every* department. RAMIS II English is one more powerful demonstration by Mathematica of the increased productivity available through RAMIS II—the *real* leader in complete software for business.

RAMIS II ENGLISH MAKES IT EASY TO UNDERSTAND WHY WE'RE THE REAL LEADER IN COMPLETE SOFTWARE FOR BUSINESS.

Let RAMIS II English speak for itself. See it in action at one of our regional Product Demonstration Centers. For more information, contact your local Mathematica office, call toll free (800) 257-5171, or return the coupon below.

Insurer looks to double business with system

FRAMINGHAM, Mass. — A small mutual insurance company hopes to double its business by 1987 with the help of data processing capabilities more typical of the insurance industry giants.

Lumber Mutual Insurance Co.'s goal is a fully automated system for underwriting and issuing property and casualty policies. It is the only company of its type using the Digital Equipment Corp. Decsystem-20, according to Lumber Mutual's Corporate Information Systems manager, Wayne Di Matteo.

"It definitely has increased our productivity, allowing us to be more productive at the same cost. I would venture to say that we could increase our current book of business by one-third to 50% and maintain current staffing," Di Matteo said.

The company calls itself "small," with $19 million in premiums written in 1982, but a leader in automation. Lumber Mutual has a goal of $50 million in premiums for 1987.

According to Di Matteo, the firm was one of the first to use computers to issue policies in the early 1960s. But agents refused to accept those policies, preferring manually produced policies. In 1974, Lumber Mutual discontinued its in-house system and handed over its data processing to a service bureau that handled the company's work on a batch basis. That arrangement was unsatisfactory because the service bureau constantly changed hands and was unresponsive to Lumber Mutual's needs, Di Matteo said.

In 1979, the company installed a Decsystem-2020. It replaced that machine with a Decsystem-2040 in 1982 because the company's needs had been "grossly underestimated," Di Matteo said.

When he joined the company in 1980, Di Matteo was charged with establishing the Corporate Information Systems department and with creating a five-year data processing development plan to support the company's projected growth. At that time, the company was using the system for processing premiums and statistical reports.

The insurer had made its initial decision to buy DEC equipment because of price and has stayed with it through two upgrades because of the substantial financial commitment it made during conversion. The latest upgrade, last year, was to a Decsystem-2060, which Di Matteo said can "better handle our increased automation and heavy development."

Today, policy processing is partially automated and partially manual at Lumber Mutual and other small companies. Policies are manually rated, underwritten and typed. The data entry staff inputs policy information into the computer, which generates reports in areas of premiums/coverages, claims and finance/accounting.

Most of the home office staff of 125 use the Decsystem. Claims, accounting, financial and other specialists directly access the computer instead of going through Corporate Information Systems for each request.

However, Di Matteo and seven systems analysts and programmers are creating an on-line, integrated system due for completion in 1987.

By then, the company expects to be able to input directly policy applications, endorsements and renewals as they are received. If the policy meets underwriting criteria, it will be printed and billed by batch process immediately.

Applications that fall outside the criteria will be sent to special files so underwriters can decide whether to accept or reject them. The system will monitor individual underwriting performance through error and audit reports.

The company already is running an MSA general ledger and financial reporting software package, which Lumber Mutual hopes to extend to allow customized reports for the operational staff and management.

When complete, the automated system should allow underwriting specialists to answer customer inquiries by calling up and recreating the policies and coverages as they existed on any given date. The system will be implemented by type of policy, beginning with home owners policies this year.

Di Matteo said the Decsystem-2060 and Decnet facilitate tying into network facilities such as the Insurance Value-Added Network Services, developed by the Insurance Institute for Research, and communication with systems operated by independent agencies and two-company-owned agencies. Also expected to be included in the networking scheme are the home office's IBM Personal Computers and Wang Laboratories, Inc.'s OIS 50 office system.

But there is one drawback to the Decsystem-2060, according to Di Matteo. "The only problem is that they have discontinued the Decsystem-20 and 10 product line. So when it comes time to upgrade, we are going to have to make a substantial investment," he noted. "But I hope that is several years away."

NOW CCA'S MODEL 204 DBMS CAN DO SOMETHING EVERY EXECUTIVE CAN APPRECIATE.

NEWS

Wholesaler meets protocol needs with system

KANSAS CITY, Kan. — One of the nation's largest wholesale distributors of telecommunications equipment recently installed a processor that serves as a communications front-end processor for its mainframe and also speaks the "language" of any computer its customers might own.

"We wanted to be able to communicate with any computer," Clark Mayers, manager of information services at North Supply Co., said. "We didn't want to lose business because a customer's computer used an uncommon protocol."

With over $400 million in gross yearly sales, North Supply is reportedly the largest distributor in the interconnect industry. It is a subsidiary of United Telecommunications, Inc., which also owns the nation's third largest phone company and packet-switching network.

North Supply communicates regularly with customers who use a variety of processors, including IBM's 3033, 3083, 4331, System/32, System/34 and 370/168; Hewlett-Packard Co.'s HP 3000 and HP 3000 Series 2; National Advanced Systems, Inc.'s AS/7000; Digital Equipment Corp.'s Decwriter 2; NCR Corp.'s V-8575; and Wang Laboratories, Inc.'s 2200 MVP, as well as Teletype Corp.'s Model 28 teletypewriter terminals.

"Previously, all our data processing had been handled at a time-sharing company in Kansas City," Mayers said. "Several customers were communicating to us at the time-sharing company. They would send purchase orders via electronic mail, transmitting a text file over the phone lines into the time-sharing company's computer. We were using the same system to communicate with our vendors.

"As we began transferring processing to our in-house computer during 1980 and 1981, the need for communications capabilities on a priority basis became obvious. We needed a system that could emulate a variety of protocols," he said.

ARC local network

North Supply met this requirement by installing an Attached Resource Computer (ARC)-based local-area network from Datapoint Corp. The ARC communicates directly with the computers of more than a dozen large customers, numerous vendors and with stand-alone Datapoint systems in 11 nationwide distribution centers.

Additionally, the network is used to run spreadsheet simulator software and to perform other office automation functions.

The ARC local network allows up to 255 processors to share the same disk files, printers and other peripherals, communicating along coaxial cable at 2.5M bit/sec. North Supply's ARC system uses eight processors.

The system includes a Datapoint 6010 processor that is attached (through a communications adapter and a modem eliminator) directly to the company's Sperry Corp. 1100/60 mainframe. File processing for the network is handled by a Datapoint 6600 processor, which supports 120M bytes of memory. Data communications is handled by five Datapoint 3800 processors; they support a variety of modems running between 110 and 4,800 bit/sec.

The eighth processor on the network is a Datapoint 8600 used in the Business Information Systems Department, which supports North Supply's sales force in analyzing customer needs and configuring quotes for data communications systems.

"We use it for word processing and Microsoft, Inc.'s Multiplan," Dave Falls, product engineer, said. "For word processing, we use Datapoint [Integrated Electronic Office System] software, primarily to maintain documents we provide to our dealers, such as configuration manuals. When we have updates or price changes, we can quickly go in and change what we need, using the global replace command, then print out a new copy.

"We use Multiplan for price lists," Falls said, referring to the spreadsheet simulator software package.

For additional applications, North Supply uses MTE56, a multiple terminal emulator, and teletypewriter emulator software for communications purposes, according to Kerry Reed, programmer/analyst at the company's data center. "Direct communications speeds order processing, thus providing a valuable service for our customers and vendors. Although we have one 3800 for unattended customer order entry, we have found that we can better accommodate our customers' scheduling requirements with operator assistance. Therefore, most of the calls are attended. The customers call in, and we start a job for them," he explained.

"Another important function of our Datapoint system is to communicate with the 11 distribution centers," Reed said. The distribution centers communicate with headquarters in batch mode throughout the day.

TALK SENSE TO THE IBM PC.

Introducing PC/204, a link that lets PC users turn mainframe data into spreadsheets effortlessly.

PC/204, the newest productivity tool from Computer Corporation of America, is a powerful, efficient, easy-to-use software link between IBM personal computers and mainframes. It effectively answers the pressing problem of how to let corporate managers take full advantage of today's personal computers for making decisions, while also giving them access to the corporate database in a format they can use.

First, PC/204 guides PC users as they browse through the MODEL 204 database. Then it extracts the data they need and converts it into meaningful management information for spreadsheet analysis. Lotus 1-2-3 for example. And PC/204 does all that automatically. Without the PC user having to understand anything about mainframe technology.

If you aren't already using Lotus 1-2-3, we can supply it along with PC/204. Or you can use any current IBM PC business package.

While PC/204 is helping business managers, it's also helping MIS directors.

PC/204 uses the power and intelligence of the personal computer for increasing the overall efficiency of an application.

For one thing, it improves performance of the mainframe by offloading some of the processing to the PC, while reducing PC users' response time. It also makes communication between the PC and the mainframe more efficient.

What about security and control? PC/204 provides individual management views of the corporate database while still allowing PC users access to all the information they need.

PC/204 is the latest reason to get MODEL 204 DBMS which has been so highly rated for performance and programmer productivity.

For more information or to arrange for a demonstration of PC/204's capabilities, simply return the coupon or write to us on your letterhead.

Inquiry system speeds service's turnaround

BOULDER, Colo. — Magazine subscription processing has become a technological challenge involving millions of pieces of mail and billions of bytes of information.

Neodata Services meets the challenge with systems — developed on an IBM 3081 processor — that answer a subscriber's inquiry within 24 hours of its receipt. In the past, 42 people might have handled a single piece of paper, but today one operator can handle the whole cycle.

"Without our system we would be in a much more difficult, a more competitive situation, from a service point of view, and we would be taking much longer to resolve any subscriber inquiries," said Pete Keeney, director of technical planning and development.

"It's working very nicely. We are processing 100,000 CICS transactions a day. The cost realization that we are getting is better than we anticipated, and there is much better service to our subscribers," he added.

In the last 25 years, magazine publishing has evolved into a sophisticated marketing operation, requiring massive sets of statistics on the buying public. Thus, the role of the fulfillment house is twofold: serving the subscribers by processing orders, payments, cancellations, change-of-address notifications, inquiries and magazine mailing labels; and serving the publishers by supplying statistical information about the marketplace.

Originally owned by *Esquire* magazine, Neodata now is a division of the A.C. Nielson Co. It reportedly is the largest independent fulfillment house in the country, employing some 1,400 people and servicing various publishers.

Subscriber services are handled by several systems linked to the IBM 3081 mainframe.

Incoming mail, with the exception of mail in unidentifiable envelopes and new subscriptions from special promotions, is processed by Scan-Optics, Inc. optical scanners that read the keyline or letter font on cards and envelopes.

All media, except inquiries, is processed on Data General Corp. Eclipse S/140 minicomputers and transferred to IBM 3380 Direct Access Storage Devices. The IBM 3081 generates output that includes mailing labels, bills, renewal promotions and responses to inquiries.

Subscriber inquiry system

Neodata developed its own system for answering subscriber inquiries approximately one year ago. Single Transaction Entry Processing (Step) takes the symptoms of a problem reported by a subscriber — for example, nonreceipt of a magazine despite proof of payment — and finds the record. Step matches the symptoms with a set of decision tables and arrives at a tentative decision about what should be done.

The system allows the adjuster to agree or disagree with Step's recommendation, correct the error and produce a laser-printed postcard to be mailed to the subscriber that night.

Company officials reported that one by-product of Step is that the inquiry system is no longer like a monotonous assembly line for adjusters; it allows for one adjuster to see a claim through from start to finish. They also noted that the system gives the employees the satisfaction of a job well done. Because of Step, the adjusters are happier, more productive workers, according to Keeney.

Company officials reported that its employees have a relatively high technological competence, which encourages recognition of how new technologies can be applied. They said such a recognition is crucial in an organization that receives 100 million pieces of mail and sends 400 million pieces of mail each year, while producing 70 million mailing labels each month. Neodata's business makes up 1.5% of the U.S. Postal Service's total volume.

Shorter response times

Keeney said that shorter response times on subscriber correspondence benefit both the client and Neodata by cutting down on the number of inquiries to be processed.

A key client service is supplying statistical information to the publisher, which is handled through an IBM DL/1 data base management system on the IBM 3081. The system continuously uses the subscriber main file of 66 million names and addresses to test promotion efforts. For example, the results of promotion pieces printed on different color paper stock can be compared, based upon the number mailed, the number returned and the percentage of those that resulted in payment or nonpayment.

Using an IBM macro language, clerical workers can select the criteria for promotion updates until the day before the promotion is run.

Such flexibility is crucial to Neodata's clients because magazines are relying more and more on subscription renewals for revenue, rather than on advertising revenue.

Confidentiality is assured with Lynde-Ordway, Government Approved, top secret paper shredders. In today's competitive world confidential materials from computers, microprocessors and copiers must be protected. Privacy laws require it. The incidence of piracy makes it vital. That's why so many high tech companies rely on Lynde-Ordway paper shredders, to protect business secrets.

We offer a complete line of paper shredders, from small personal and office machines to commercial shredders and microfilm shredders. Lynde-Ordway is *the* major distributor and manufacturer of the best names in paper shredders. . . equipment that delivers solid value and real economy. Our large inventory and wide selection is backed by an extensive supply of parts and dependable service. Call today, you can count on fast response from Lynde-Ordway.

LYNDE-ORDWAY COMPANY, INC.
Quality and Integrity Since 1925

The PCI 171 protocol converter. Designed for companies who want to use ASCII devices to communicate in an IBM Bisync environment. ASCII to BSC 3270 emulation for non-SNA applications.

The PCI 167 protocol converter. Use virtually *any* ASCII device to speak SNA, including low-cost terminals, printers, teletype printers, graphics plotters, micros, etc., etc., etc. It's the NTO software chameleon. ASCII to SNA/SDLC 3767 emulation.

New from PCI. The Series 100.

Protocol Computers, Inc. introduces the Series 100, a [illegible] approach to hooking the non-IBM world to IBM.

Now you can have Personal Computers talk to IBM. Terminals [illegible] to IBM. Printers [illegible] to IBM. Any ASCII device [illegible] to IBM. Any ASCII [illegible]

[illegible] the Series 100 [illegible] you want to talk to IBM.

Pr

School districts share computer center

The Computer Services Division of the Essex County Educational Services Commission upgraded its facilities with an interactive NCR Corp. 9050 computer, four NCR 6590 disk spindles, two NCR 6540 disk drives and six CRT terminals.

EAST ORANGE, N.J. — As part of the continuing battle to provide high-quality educational services in a cost-efficient manner, eight New Jersey school districts banded together in 1979 to form the Essex County Educational Services Commission. Among the commission's many programs is a computer center that services member school districts.

A nonprofit public agency, the commission is funded primarily through fees paid by participating school districts. Those fees are sometimes offset by state aid and grants. The agency provides direct services to students in nonpublic schools, special education programs, transportation services and computer services.

Through a cooperative arrangement, the computer center is located in Newark at the Technical Career Center, one of the Essex County vocational schools. The center not only provides service to the schools on a time-sharing basis, it enables member school districts to share computer service costs and make use of the limited number of qualified DP personnel working in the public sector. Member schools are billed annually rather than on a per-use basis.

The Computer Services Division (CSD), a part of the computer center, is guided by Director Roy Beardsley and Technical Services Manager Gil Eckert. Both realized that as school administrators faced the problem of having to operate with increasingly limited resources, there would be a growing need for up-to-date management information and controlled data processing costs.

CSD offers standard and customized software packages providing services in the areas of financial management, personnel, payroll, student record keeping and computer-assisted instruction and career planning. The systems were designed for use by non-DP professionals. CSD coordinators implement the systems, train the people who will be using them and provide continuing support.

Under this joint venture, individual school districts coordinate and control the quality and costs of computer equipment software, maintenance and technical staff. Beardsley believes that because many CSD personnel have strong educational backgrounds, they are more responsive to and better understand the particular needs of school districts.

After the commission's formation, bids were solicited from a number of vendors; several, including NCR Corp., Hewlett-Packard Co. and IBM, were encouraged to submit bids. After examining the five or six bids received, the agency selected NCR equipment and some software packages because it believed the NCR package offered the best solution to its problems.

"NCR was really the best at that time with an interactive system, and we were convinced by some of its existing software as well," Beardsley said. Specifically, some of the packages appeared to meet needs the state was going to require for financial record keeping, he added.

"We chose the NCR IRX operating system because it allows us to utilize functions in our operations and program development that are normally reserved for larger computers, often increasing productivity and eliminating the need for a large data processing staff," Beardsley said, adding, "Even now we are just beginning to appreciate what it does automatically."

CSD installed an interactive NCR 9050 computer, four 6590 disk spindles and two 6540 disk drives, along with six data display terminals. The system is on-line to 15 remote sites via an NCR 621 Multiplexer communications center. More than 100 districts receive some record-keeping services through CSD. A variety of software, including modified NCR packages, in-house-developed packages and packages from other vendors, is used to process a number of financial and educational programs.

A student data systems coordinator is responsible for implementing programs such as student scheduling, attendance, grade reporting, test history and special services information management, designed to reduce the time spent filing the plethora of reports required by state and federal mandates.

"I can run the attendance for 3,000 students in 10 minutes," William Mericle, principal of Irvington High School, said. "Before we were on-line to CSD, teachers wouldn't get attendance records until the following day."

Some data security methods work better than others.

TOP SECRET the state-of-the-art resource protection package for MVS works best of all.

TOP SECRET is data security at its best. Offering quick installation, phased implementation and comprehensive resource protection, TOP SECRET outdistances all other data security methods for total resource protection.

TOP SECRET immediately secures your most critical resources without impacting normal processing. Implement security with no delay and with absolutely no modifications to your operating system.

TOP SECRET is the only total resource protection package that offers comprehensive CICS security, including file and program control and protection down to the field level.

By using the Standard MVS Security Interface, TOP SECRET becomes an integral part of your operating system. Complete compatibility with all IBM and vendor products that use Standard Security is automatic and guaranteed, now and in the future.

TOP SECRET security comes with the same top-notch technical support that guarantees the quality and reliability of all CGA software products.

Protect your valuable data resources today. Join the MVS sites across the country that have considered every data security method and made the sure TOP SECRET choice.

Application tool gives Coty's DP a new look

SANFORD, N.C. — Installing an application development generator at a major perfume and cosmetic house meant much more than a subtle change in the way the data processing center operated. The department got a complete makeover.

The application generator installed at Coty headquarters here resulted in increased programmer productivity and eliminated the need to augment the DP staff, according to Ed Eberbach, the company's programming and software manager. Moreover, in addition to giving users more on-line facilities, the system also helped streamline delivery of applications and reduced training requirements, he maintained.

Starting in 1980, Eberbach began to notice that more and more users were requiring on-line systems. Coty's relatively small programming staff was becoming increasingly hard-pressed to keep up with the demand.

While the maker of fragrances including Nuance, Sophia and Stetson did have CICS capability on its IBM 4341 mainframe, the system operated on an inquiry basis only, Eberbach explained. Working with the system was slow and laborious. In order to increase Coty's ability to deliver on-line facilities, Eberbach knew that something more had to be done.

"We were faced with the alternative of continuing with command-level Cobol or selecting an applications development tool to increase programmer productivity," Eberbach recalled, "but previous experience with command-level programming convinced me that we had to find more effective programming tools."

Consequently, the company began a search for an application generator that could leverage the productivity of Coty's three programmers and two systems analysts. Eberbach and Al Brown, manager of systems and operations, led the company's evaluation effort.

"Having limited in-house command-level expertise and seeing the need for more on-line development, it made it essential that we get a very user-friendly applications development facility," Brown said.

Early in 1981, Coty reviewed existing programmer productivity tools. The selection committee quickly identified IBM's DMS, Cincom Systems, Inc.'s Mantis, Informatics General Corp.'s Trans IV and Oxford Software Corp.'s User Files On-Line (UFO). Other products were rejected either because they were not suitable for Coty's environment, there was a question of continuing vendor support or the products were deemed too difficult to use, according to Eberbach.

Throughout Coty's evaluation phase, another division within its parent company — the $3.45 billion Pfizer Corp. — was undergoing a similar search for an appropriate application generator. Furthermore, the Groton, Conn.-based chemical division had many of the same requirements as Coty.

The groups began trading information and experiences based on vendor visits, and eventually they agreed upon Oxford's UFO, which promised to automate and enhance the development and maintenance of on-line applications in a CICS/VS or DOS/DC environment.

The system was installed at both divisions in July 1981, and the benefits were immediately obvious, Eberbach stated, when a programmer replacement slot was not filled. More than a year later, Coty's plan now is to fill that position from within on a trainee-level basis.

After installing UFO, the pace of developing systems picked up. "Our statistics show a five-to-one productivity ratio," Eberbach said. "A task that required five hours under command level requires only one hour under UFO."

In fact, the entire work balance of the data processing department changed. Previously, one systems analyst at Coty kept two to three programmers busy. After the installation of UFO, that ratio shifted: Now only one programmer is required to support one systems analyst, Eberbach claimed.

In two years, two programmers have successfully developed 48 on-line systems. Coty has leveraged the productivity potential of UFO by recognizing that most Coty systems were structured in similar ways: They referenced one or two data bases, and they had typical add, change, delete, list and inquire components. By structuring templates for representative systems and then using the UFO Copy facility, Coty could generate new tailored systems very quickly, Eberbach said.

Both Eberbach and Brown offered the following advice to applications development generator shoppers: Visit a site where the system under consideration is installed and actually witness a system develop from design specifications, through actual coding and testing, to delivery. "Just that experience alone can convey most of the powers that the system has," they concluded.

A little couponwork takes the endless paperwork out of data base design.

People involved in data base design have had good reason to be frustrated: They've had to endure a maze of endless paperwork and manual procedures so that others may escape it.

MANAGER SOFTWARE PRODUCTS' DESIGNMANAGER™ provides them with a method of carrying out data analysis and data base design quickly and cost-effectively – without endless paperwork.

DESIGNMANAGER's central driving force is a modeling dictionary that holds information about your organization's data resource. The content of the modeling dictionary is interactively built up by end-users and analysts directly through two complementary methodologies: top-down (Enterprise model) and bottom-up (userview model).

The reconciliation of these two components provides the basis upon which you can construct and verify models of your organization's data, and generate stable, third-normal form logical data base designs.

DESIGNMANAGER can increase user productivity whether used as a stand-alone system or fully integrated with other dictionary-driven products in MSP's MANAGER family. These include DATAMANAGER™, the data and information resource management system, and SOURCEMANAGER™, the COBOL application development system.

Find out how DESIGNMANAGER can take the endless paperwork out of your data base design work and increase productivity. Send the coupon today. Or call (617) 863-5800 (Telex 710 326 6431).

Send me more information about MANAGER SOFTWARE PRODUCTS' family of integrated, dictionary-driven products:

Brake maker goes on-line, upgrades security

SOUTH BELOIT, Ill. — When a major manufacturer here began converting all its applications to an on-line system, potential security problems prompted management to seek a data security system.

Warner Electric Brake and Clutch Co. is a $151 million manufacturer of motion control equipment, including electromagnetic brakes and clutches, step motors, ball bearing screws and photoelectric cells. The company has four international and seven domestic sites, including plants in Roscoe and Marengo, Ill., and Pitman, N.J., which access Warner's IBM 4341 processor at its headquarters here. The mainframe, with 4M bytes of main memory, utilizes IBM's CICS teleprocessing monitor under the DOS/VSE operating system.

Before Warner began its application conversion project, data security was the joint responsibility of the DP department and the internal auditing staff. Although the firm had not experienced any security breaches, management wanted to circumvent the possibility of unauthorized access while transferring sole responsibility for security to the internal auditing staff. Warner also felt the CICS security provided by IBM was inadequate to protect the company's expanding system.

"IBM conventions in CICS forced us to limit our security groups in CICS to only 24," said Renee Eschida, manager of systems and data processing. "That level of security was acceptable when our only on-line systems were order entry, billing and accounts receivable. But when we began adding shipping and receiving, accounts payable, bills of material, routing information and purchasing to our on-line system, we quickly ran out of CICS security groups."

A team of DP and internal audit personnel began evaluating CICS security software but, according to Eschida, found few packages designed for the DOS/VSE environment that offered the level of sophistication Warner's management required. After extensive research based on a set of management-developed criteria, the project team eventually chose On-line Software International, Inc.'s Guardian security package.

Numerous external functions

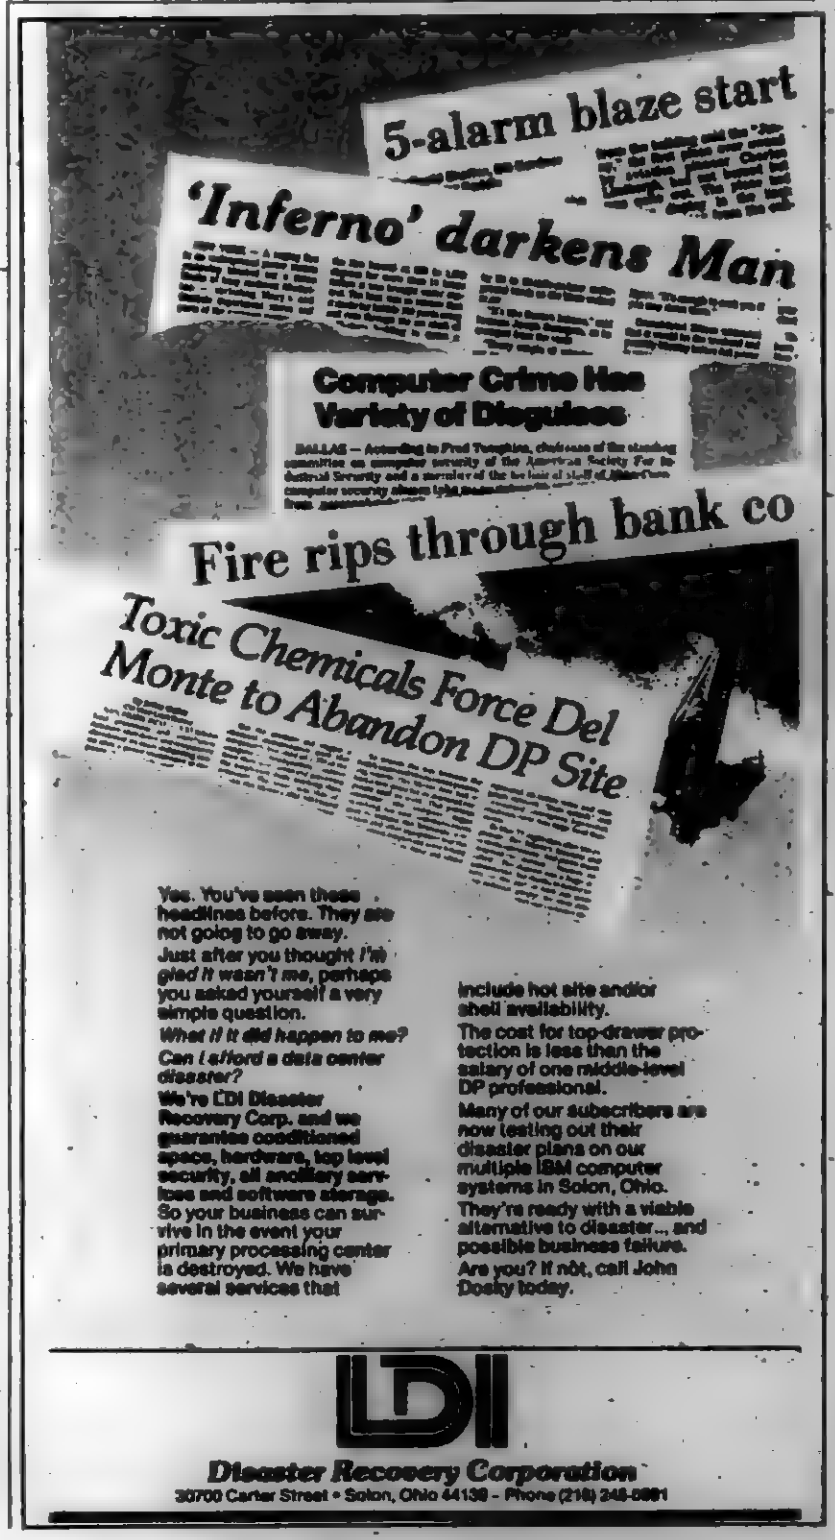
One factor behind Warner's selection of that package was that Guardian offered numerous external functions that enabled the manager of internal audit to supervise the data security system. According to Eschida, the system's structure allowed that manager, who had little DP experience, to enter the firm's security guidelines easily. In addition, Warner set the system to log all security violations, such as when Guardian shuts down a terminal because a user has made more than three attempts to log on. A reporting function helps management locate those violations.

Eschida said the system also gave Warner automatic protection at the field level as well as for all programs, terminals, files and transactions. "Our accounts payable and purchasing departments require access to the same screen," she explained, "but one department is only allowed to change vendor purchasing information, while the other is only allowed to update the vendor payment data. Consequently, the DP staff either has to develop two different screens or protect the data at the field level. Guardian lets us do the latter, which is much more efficient than creating new screens."

Currently, Guardian protects more than 200 Warner files operating under Cincom Systems, Inc.'s Total data base management system. Warner has also utilized Guardian to protect some 350 users working on 97 terminals at the three remote sites. The company has put a "time-out" parameter on each screen, which causes the screen to go blank if there is a lack of activity within a specified time interval.

For example, Eschida said, unattended screens in marketing go blank after 30 minutes because the terminals are in a secure area. But a screen with payroll information that can be accessed from a terminal on the production floor goes blank after only one minute.

More importantly, the Guardian package did not degrade the performance of Warner's other systems.



Yes. You've seen these headlines before. They are not going to go away.

Just after you thought *I'll glad it wasn't me*, perhaps you asked yourself a very simple question.

What if it did happen to me? Can I afford a data center disaster?

We're LDI Disaster Recovery Corp. and we guarantee conditioned space, hardware, top level security, all ancillary services and software storage. So your business can survive in the event your primary processing center is destroyed. We have several services that include hot site and/or shell availability.

The cost for top-drawer protection is less than the salary of one middle-level DP professional.

Many of our subscribers are now testing out their disaster plans on our multiple IBM computer systems in Solon, Ohio.

They're ready with a viable alternative to disaster.., and possible business failure.

Are you? If not, call John Dosky today.

Financial system hikes wholesaler's cash flow

HAUPPAUGE, N.Y. — A leading wholesaler here is using a financial and distribution software system to improve its cash flow and delivery record and to minimize its inventory of costly sample books.

Maharam Fabric Co. is a major wholesale distributor of upholstery products, draperies and wall coverings. The firm ships products from an inventory of nearly 20,000 items stored at its headquarters warehouse here. Maharam also has a smaller warehouse at its Los Angeles showroom, one of nine showrooms maintained nationwide.

According to Data Processing Manager Ann Alesi, Maharam also has an inventory of as many as 9,000 sample books, which salespeople use to exhibit products. The company formerly kept track of the sample books, which often cost more than $20 each, through an unsophisticated program running on Maharam's Hewlett-Packard Co. HP 3000 computer. The firm's financial chores, such as accounts payable, inventory control and purchasing, were handled manually.

Looking to automate the financial functions and to maintain better control over the stock of sample books, Controller Michael Belasky reviewed a variety of software packages. Belasky eventually selected Players Computer, Inc.'s (PCI) PCI/Map 3000 financial and distribution package. Alesi said PCI/Map provided Maharam with a fully integrated, net-change business system that utilizes preformatted input screens.

'Nearly paperless'

According to Alesi, the PCI/Map system has enabled Maharam to become "nearly a paperless operation." The company utilizes the accounts receivable and payable, lot receiving, inventory control, order entry, work order, purchase order and physical inventory modules of PCI/Map. Maharam also uses the system to track the valuable sample books.

"The system lets us quickly keep track of which salesmen have the books and which of the books have been left with customers," Alesi said. "We can also keep tabs on which customers are making purchases after receiving the books. It's helped us to cut down on the number of books we utilize by letting us see that the only people who get the books are the ones who are going to buy something. That way we're not haphazardly dropping the books along the way."

Currently, Maharam clerks operate 42 interactive terminals in the Hauppauge facility and six at its Los Angeles showroom, where West Coast customer orders are received and transmitted to headquarters for shipment.

The ability to input customer orders and payments quickly has proved beneficial to the firm's cash flow and delivery status.

"Our cash flow is better because we can now input customer payments much faster than we could manually," Alesi said. "It used to take us up to two or three days to process payments manually. Also, the credit department knows exactly where people stand on payments. We couldn't call somebody and request payment if we were two or three days behind on our mail. We're also able to invoice our customers more rapidly and, as a result, get payments more quickly.

"Also," she continued, "our shipments have been going out much faster. We can take a customer order in the morning, run it through a credit check and have it to the warehouse for shipment by late afternoon. That's improved our turnaround on shipments by a couple of days."

Mini helps manage builder's far-flung projects

GREENSBORO, N.C. — A housing construction firm headquartered here is using a small office system to help solve the difficulties of long-distance management.

Key Homes, Inc., a builder of single-family homes and townhouses, uses a minicomputer to help its management troubleshoot projects at a distance to prevent cost overruns and building mistakes that can inflate the price of homes.

In February of 1983, a new management team was installed at Key Homes. The group was accustomed to utilizing data base management and working with a series of computer-generated reports. But at Key Homes, only the accounting function was computerized using an IBM 5320 batch processor with a 14M-byte hard disk pushed to its maximum capacity.

The new management team decided it wanted a system that could provide more management reports and greater control over budgets and status reports and monitor general administrative items. Henry Zalkin, vice-president of finance for Key Homes and its parent company, The Key Co., was drawn to IBM's System/34 by way of a software package called Developer Management Information System (Dmis) from Management Information Systems in Florida.

"It is an on-line system written primarily for home building companies, and it runs on the System/34," Zalkin said. Using a terminal, Dmis allows the operator to look up a house and determine costs "up to the moment." With this information, managers can detect problems such as cost overruns early enough to solve and prevent them from spreading throughout an entire subdivision.

Although Key Homes management surveyed other systems used by large home builders, it was won over by the System/34. When the System/36 was announced, the company switched its order to the new system. Delivered in mid-July, the office system included a 200M-byte hard disk drive, 256K bytes of random-access memory, an IBM 5251 terminal, an IBM 5291 terminal and an IBM 5225 printer and disk emulation for hardware and software.

Zalkin also ordered two IBM Personal Computers, which he hopes to use with a software package called Homer from M.A. Hancock & Associates of Florida.

Salesmen can use Homer to determine monthly payments, equity buildup over periods of time and whether a client is a potential investor. It can also provide customer deposit and inventory status reports. Zalkin is trying to adapt the package to run on the IBM PCjr. If successful, he plans to put PCjrs in Key Homes construction offices.

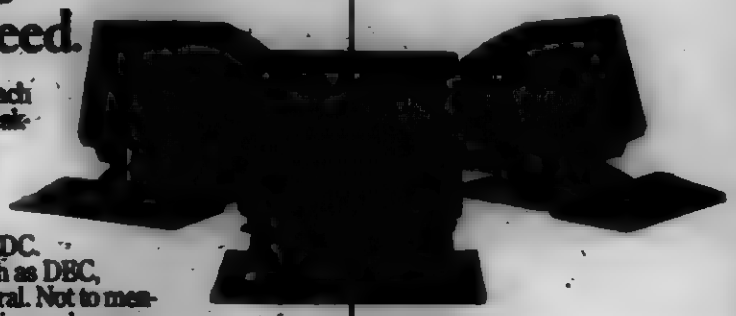
Flexibility sought

Using a Personal Computer connected to the System/36, on-site managers will gain a measure of autonomy and flexibility in managing their projects, which management hopes will stimulate growth in the company. "The Personal Computer will give Key Home builders the capability to qualify potential home buyers for loans at its on-site sales locations, bringing speed and accuracy to this task," Zalkin said.

Also, managers in Greensboro, for example, using a Personal Computer, can review the status of homes under construction each week to determine if the work is progressing smoothly.

"If we can control field supervision so mistakes aren't happening, we can sell more competitively," said Francis Tivnan, company president. "And that means that the consumer doesn't pay for the mistakes."

Northern Telecom's information processing products have the communications capability you need.



The 500 Family

Besides being compatible with each other, Northern Telecom's 503 desktop computer and 565 and 585 information processing systems communicate effectively with a multitude of mainframes, including IBM, Burroughs and CDC. They also talk to other minis such as DEC, Hewlett-Packard and Data General. Not to mention word processors such as Lanier, and even micros such as TRS-80 and Apple.

This means you'll have more flexibility—and more control over your information system. Even if more and more personal computers are becoming a part of it. Our 500 family supports the CP/M* operating system software, so employees can have the personal computing capabilities they want, while your company keeps the organizational unity it needs.

At the same time it's running CP/M, the family can also be running its own unusually powerful operating system which is compatible across the whole 500 line. It permits a unique approach to multitasking—with a few simple keystrokes, up to 16 tasks can be performed simultaneously on the same terminal. Data processing, personal computing, spread sheets, word processing, information management, electronic mail, whatever task needs to be done can be done at the same time. An incredible timesaver.

All in all, the 500 series is quite a family. Versatile, reliable and a perfect example of Northern Telecom's OPEN World* commitment to compatibility. Northern Telecom is a world leader in digital technology and we're using this expertise to make sure our products fit comfortably into a multivendor world.

For more information, call 800-621-6476 (in Illinois 800-572-6724), or write to Northern Telecom Inc., P.O. Box 10934, Chicago, IL 60610.

System helps service firm curb midnight rides

BLAIR, Neb. — When AT&T started using Bitran, a facility that allows telephone companies to retrieve toll call data by using telephone lines, Mid-America Computer Corp., a service bureau here, was excluded from the network. Incompatible communications equipment cost time and caused aggravation for Mid-America, which processes telephone toll call data provided by AT&T for 205 independent telephone companies in 10 Midwestern states.

"We were driving to the airport in Omaha and picking up reels of tape from midnight airline flights," Donald Waite, manager for information services at Mid-America, recalled.

"Before we could use the Bitran system, we had to wait until the end of the month for AT&T to mail us a tape with toll call data," said Waite. "Whenever AT&T was late, we had problems meeting our customers' delivery needs."

Mid-America looked at several systems that would allow its IBM 4341 mainframe to communicate with the Bitran network. For $5,500, it purchased Teleprocessing Remote Access Control System (Trace) from Sterling Software Marketing.

Trace communicates with a variety of bisynchronous mainframe, minicomputer and microcomputer devices. It runs under IBM OS and DOS operating systems.

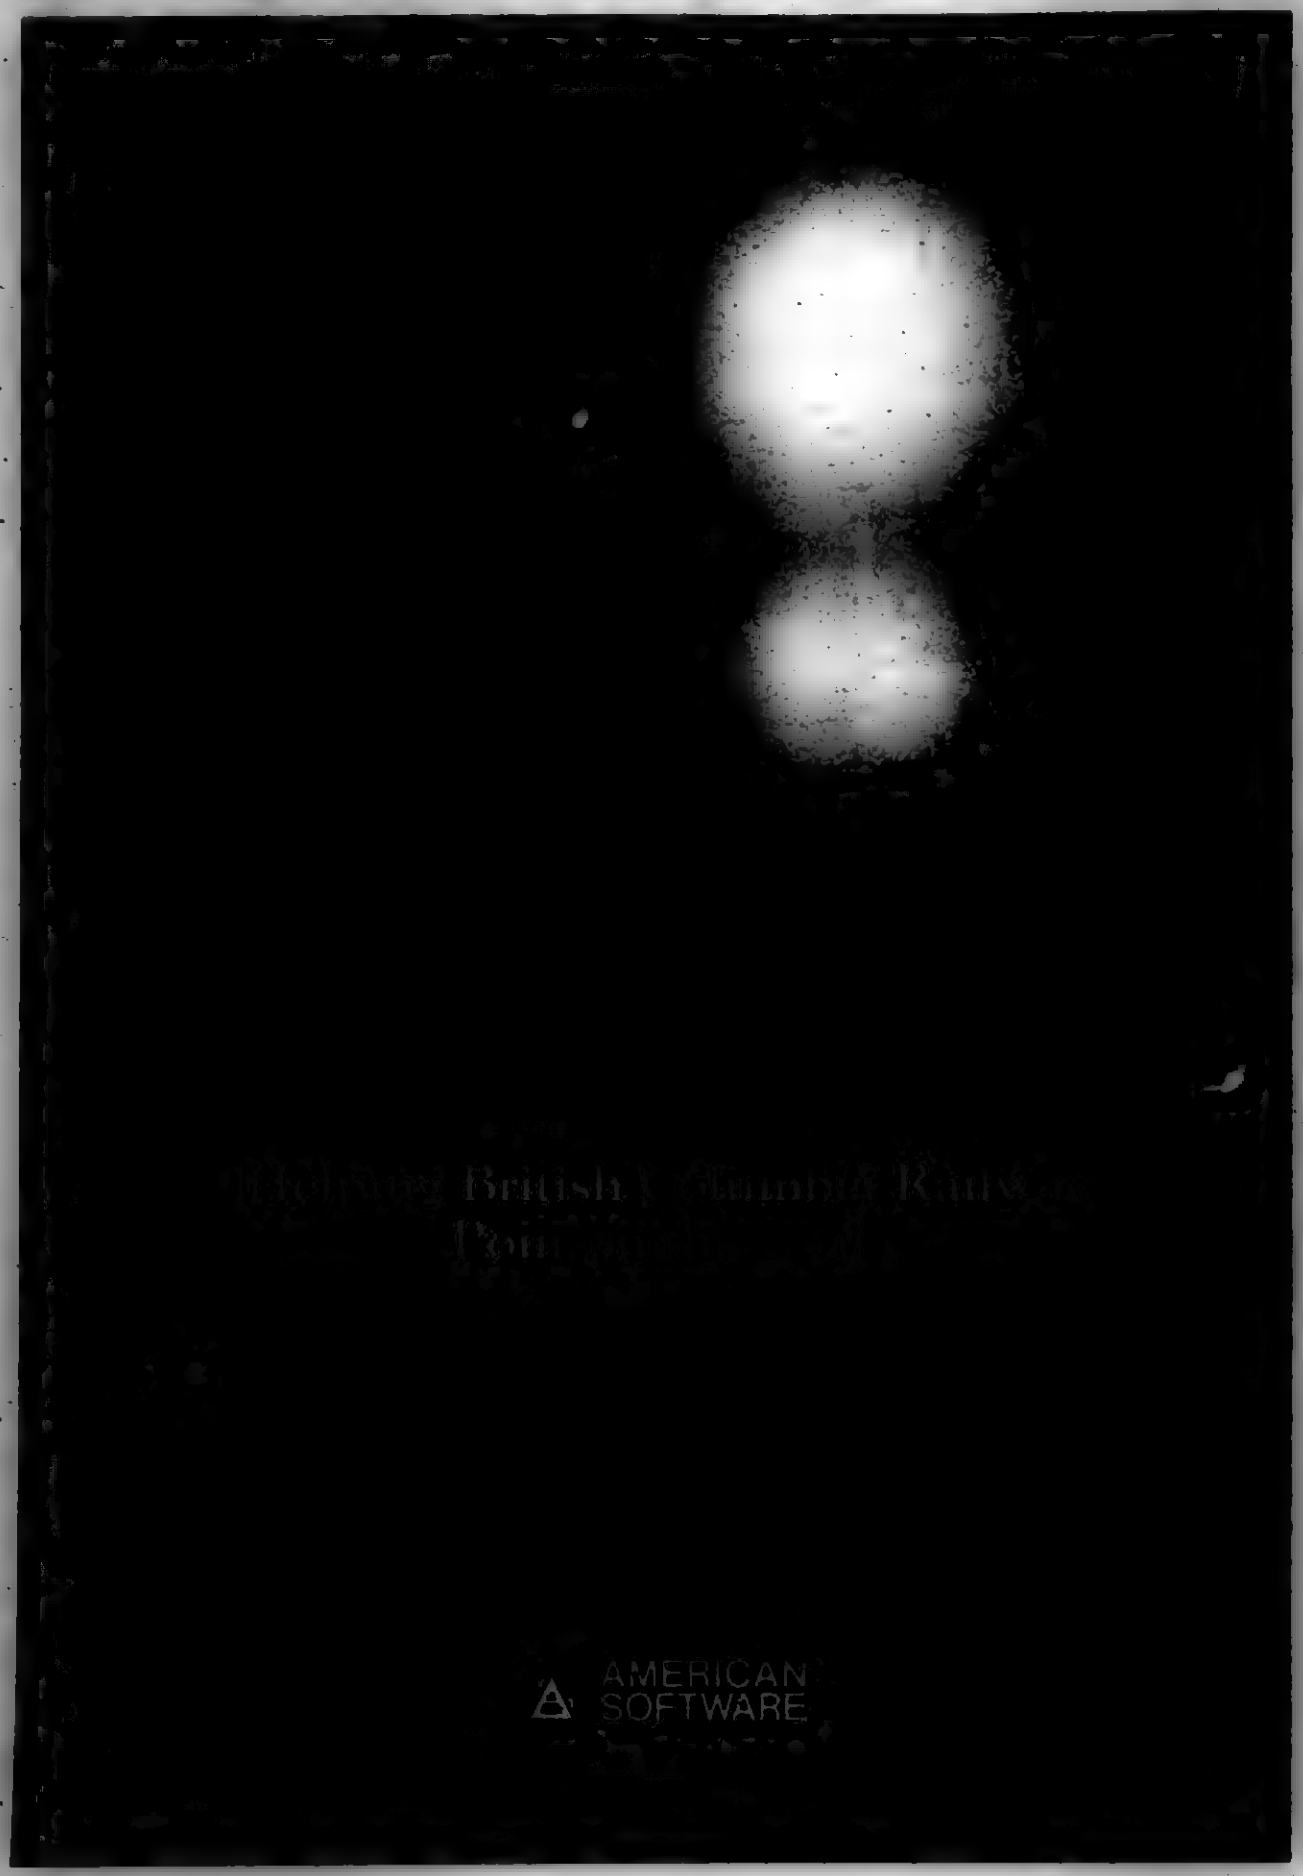
Since installing Trace, Mid-America has found many uses for the product. "We send and receive many types of telephone toll data," Waite said. Mid-America can communicate with IBM System/34s. "Since System/34 users can't use magnetic tape, they are always looking for ways to get their data," he said. "We communicate with System/34s and transmit data to them."

Trace provided Mid-America with greater productivity, Waite said. "Previously, one circuit was dedicated to CICS each morning," he explained. "If we couldn't write programs to run under that CICS facility, we couldn't use that circuit.

"With Trace, you use a vacant communication line, and you can write innumerable Trace applications. They can all use one circuit, the same communication line. You don't need multiple communication lines for multiple transmissions," he said.

Trace is easy to use, according to Waite. "It utilizes a simple keyword macro, which makes it very simple and straightforward," he said.

Mid-America may use Trace to write other applications for Bitran. "With the divestiture, there are additional reports that AT&T now requires," Waite said. "We may use Trace to produce these reports."



Adcis chief appointed

COLUMBUS, Ohio — Ronald C. Comer has been elected president of the Association for the Development of Computer-Based Instructional Systems (Adcis), an organization of professionals involved in educational uses of computers.

Comer is director of the Division of Computing Services for Medical Education and Research at Ohio State University's College of Medicine. The division designs and maintains computer-assisted instruction material in the health sciences.

Comer has been an Adcis member for 11 years and has previously held several other offices in the organization. He will preside at this year's annual conference in Columbus on May 14-16.

Introducing APS/IMS

40% Improvement in Productivity Without the "Black Box."

Introducing APS/IMS—the only application productivity system designed specifically to meet the complex needs of the IMS Development Center.

Looking For Productivity Tools?

If you're an IMS user and looking at productivity improving tools, be careful. Most products on the market today have taken a "black box" generator approach to productivity improvement. You may be looking at one right now. While these tools can be fine for putting up simple things fast in a low-volume environment, they fall apart when subjected to the complex application, performance and maintenance issues of the IMS world.

Introducing APS/IMS— The Source-Based, Layered Solution

APS/IMS is the application productivity system that, for the first time, offers a strategic solution for the IMS Development Center. Unlike "black box" productivity tools, APS/IMS offers a source-based, layered solution for IMS users.

Source-based means that APS is engineered to be compatible with your existing source-level interfaces and requires no run-time overhead. With APS, you don't have to adopt a new language or a new design methodology.

The five APS components are housed in a layered architecture. The APS layered approach uniquely addresses the different technical skill levels within your organization as well as the broad range of application development and maintenance requirements you face:

- **Screen Painter** — engineered for end-users, designers and programmers. Using the painter, designers can interactively define screens at their 3270 or PC workstations. After screens are painted, APS will generate MFS, BMS, working storage and hard copy documentation.
- **Command Level Support System** — designed for COBOL programmers and requires no IMS knowledge. Through the use of powerful DB and DC Command Sets in a Structured COBOL programming environment, this facility allows programmers with no IMS experience to write comprehensive batch, DB and online applications.
- **Macro Level Interface** — leverages the skills of senior programmers and analysts who know IMS. This subsystem provides a macro language that enables senior technicians to extend, modify and control the Command Level environment. This additional productivity layer allows senior technicians to control systems performance and integrity without being forced to "exit" to the native IMS level.
- **Data Description Interface** — reads your existing IMS data base descriptions (whether or not you use a dictionary) and automatically provides information about the data base structure to APS/IMS.
- **APS Precompiler** — combines the outputs of the other APS components and generates native COBOL, IMS source. The APS Precompiler traps coding errors, validates IMS calls and adds no run-time overhead.

Increases Productivity By 40%

The productivity gains of these five components benefit every phase of the application life cycle—from initial design through maintenance programming.

Because of the APS layered architecture, you choose the productivity and performance ratios you need based on the specific application requirements at hand. No other product offers you this degree of control.

To date, APS users are reporting design, coding and test savings of 25% to 40% over traditional methods—with savings of 50% during the maintenance phase.

Call Today For More Information

APS/IMS can begin immediately to address your IMS Development Center requirements without forcing you to sacrifice the control and flexibility you need. With APS/IMS, there is no "black box" and there are no traps.

If you think the other productivity systems you've looked at compare to APS/IMS, look again. Before it's too late.

Call now for more information. If timing is critical, ask about the *FAST TRACK* evaluation process. We'll be happy to show you how APS/IMS can address your IMS productivity needs.

YES, I am interested in APS/IMS.
☐ Tell me about the *FAST TRACK* evaluation.
☐ Contact me for a product presentation.
☐ Please send me more information.

Mini forges production boost at metals firm

JERSEY CITY, N.J. — By automating its information management and accounting functions, Schiavone-Bonomo Corp., a metals processing and trading firm here, reportedly increased productivity by 20%.

The company began automating its manual functions in 1966. Two years ago, it decided to automate its largest and only unautomated application, metals and alloys inventory.

"The system had to track material from purchase to sale, check the status of shipments in case of vendor inquiries and keep management informed on outstanding contract balances," Philip D. Carnevale, the company's controller, said. "Our IBM System/3 minicomputer could not handle all these functions."

So Schiavone-Bonomo bought a $100,000 Wang Laboratories, Inc. 2200 VS80 small business computer to provide on-line data and custom reports to traders, executives and accountants. "The system is saving the company approximately $75,000 to $100,000 per year," Carnevale said.

The system acquired by Schiavone-Bonomo, whose annual sales total more than $50 million, includes 384K bytes of main memory, two 75M-byte disk drives and a high-speed line printer. Eight workstations are connected to the system: three are needed by the programming staff; three are used by the accounting department; traders and their support staff require one terminal; and the metal and alloys warehouse uses a remote workstation.

The VS80 system was installed in June 1982, and an on-line accounting program was rewritten for the system. Recently, an on-line recurring journal was completed by Schiavone-Bonomo programmers. "It eliminated manual posting, keypunching and loading of data," Carnevale said. "We generate journals, general ledger, profit and loss statements by division, consolidated financial statements and our payroll on the computer."

Two years of planning were required to automate a complex metals tracking system. For Schiavone-Bonomo's metal traders, the new system supplies up-to-date supply contract information. "If traders can base decisions on today's — not yesterday's data — business should increase," Carnevale said.

When bidding on a supply contract, traders consider current inventory, open contracts and the average material buying price. Previously, an accounting clerk was needed to produce totals for outstanding orders. Traders now use a terminal to display outstanding contracts, quantities delivered, balances due, average prices per gross ton and the value of outstanding tonnage.

An in-house program replaced a time-consuming manual method of calculating the value of each grade of scrap metal. Traders use screen prompts to enter the market value of 12 different elements. In minutes, a report is prepared that details the values of inventory items.

Traders use the system for record keeping. By entering a vendor number, a trader can look at outstanding contracts for a shipper or display individual contract information. A twice-weekly printout permits traders to follow up on late deliveries. When vendors inquire about shipments, traders can use a screen display, rather than a walk to the warehouse, to answer questions.

Time saver

The system also saves managers time.

Previously, an employee would begin compiling information for a position report on open contract balances on Thursday and complete the report by Friday noon. The reports would then be used during a Monday meeting, where nonferrous metals and alloys price ranges are set.

"Now we can prepare the reports Monday morning, and it includes Friday's data," Carnevale said. "Because the report is more accurate and timely, management can make better decisions."

Contracts are a prerequisite for processing shipments at the warehouse. When material arrives, entering a contract number prompts the system to assign a lot number. Then, warehouse employees use a report to analyse and separate the material. A clerk or trader reviews the report, and the results are entered on a workstation.

Data from the metals and alloy system feeds into an accounts payable application. "We use an integrated system," Carnevale said. Copies of the settlement reports are mailed out with the payments. Each month, purchase data is consolidated in a journal, which updates general ledger files.

Integration allows a shipment to be traced from the purchase agreement through reclassifications to its sale.

"We maintain financial and accounting controls and user flexibility," Carnevale said. "It's a delicate balance, but we've been able to do that with the new system."

Go beyond equipment compatibility.
Reach for total performance.

The Zenith Z-100 PC's.

The Z-150 PC

In the white heat of the slalom, something clicks: skier and skis meld into one, and hurtle toward total performance. And, in your office, you'll experience that same kind of oneness with our new IBM-compatible Zenith PC's.

Their enhanced features actually take you beyond IBM compatibility. Like internal expandibility that allows you to add peripherals without adding size. Storage that can expand up to 11 megabytes. The ability to run virtually all software designed for the IBM PC. And a detached keyboard with a "smarter" key layout for added convenience.

The portable Z-160 PC

Reach for total performance with the desktop and portable Z-100 PC's: call 1-800-842-9000, ext. 1, for the name of your nearest Zenith dealer.

Introducing MARK V™ for CICS users: a *unique*, 4th generation non-procedural application development system that saves you time and money at every stage of your application life cycle—and makes it all easy.

For two years, MARK V has been saving millions of dollars in application development for IMS users worldwide. Now Informatics has expanded MARK V to the CICS environment, too. Even so, MARK V is not for everyone. *But it may be for you if:*

- ☑ You need to reduce your backlog of medium to complex CICS or IMS applications.
- ☑ You use CICS or IMS with IBM-supported data access such as VSAM or DL/I.
- ☑ Your CICS or IMS system demands highly efficient application execution.

Then, MARK V can help you produce efficient compiled applications that rival the execution of well-written COBOL—in less than half the development time!

Easy application development and maintenance is just the beginning!

MARK V improves productivity throughout the application development and maintenance cycle—not just in the coding—by providing:

- Interactive application design and simulation
- Easy to use, menu-driven specification language for development and maintenance
- Transparent and complete data access/communications control
- Automatically produced application documentation

That means with MARK V your programmer need only specify the solution. MARK V generates the complete application. This methodology allows you to solve more complex problems more efficiently using less highly trained personnel—and that saves you money!

Reserve your free demonstration of MARK V—the simple way to develop and maintain your medium to complex CICS or IMS applications.

As a data processing professional, you're also a professional skeptic. But the simplicity, versatility and timesaving capabilities of MARK V are easy to see—and prove. To do so, simply mail the coupon below or call toll free. We'll schedule your *free demonstration* as quickly as we can. Remember, however, that interest in MARK V is unusually high. Scheduling is on a "first come" basis. So mail the coupon or call *today*.

To see MARK V CICS/IMS for yourself, mail the coupon or call toll free

informatics general corporation

THE SOFTWARE ENGINEERS

NOW FOR CICS and IMS USERS WITH IBM-SUPPORTED DATA ACCESS

YES. I want to learn how MARK V can make my medium to complex applications development and maintenance both fast and easy.

☐ Please call me to arrange a free demonstration right away. I understand that there is no cost or obligation.

☐ I'm not yet ready for a free demonstration. But please send me a fact kit on the MARK V application development system.

Shopping for intelligent terminals needn't be a compromise between price and performance. Consider the standards of the Ovation™ 1041 and 1051.

Both terminals feature low-profile, detached keyboards with soft set-up and non-volatile RAM. User-programmable function keys. 14-key numeric pads. User-selectable keyclick, capacitance switches and screen-saver features to name a few.

Naturally, the VDTs swivel and tilt at a finger's touch. 12-inch non-glare video displays are standard (15-inch displays are available too).

Add two industry standard communication ports, standard or custom emulations and 128 ASCII characters. Plus a broad range of graphics characters to cover the most demanding applications.

But the Ovation 1051 goes even further.

It also includes an 80 or 132 column display providing high resolution characters. Variable speed smooth scrolling. 16 user-programmable function keys (32 with shift). 256 graphics characters. Standard 32 Kbytes of RAM that can be upgraded to 64K.

There's more.

The Ovation Series™ features a broad range of custom options. Like custom functionality, firmware, keycaps, colors, even a private label option.

All things considered, you won't find better terminal values no matter where you shop.

To find out more about the Ovation 1041 and 1051, call your local Zentec sales office today.

sempé

Finally, someone who sees the forest. As well as the trees.

In their great rush to fill the office with personal computers, people lost sight of the ultimate objective. To work together more productively.

Then Sperry appeared.

With a remarkably simple solution. The Sperry PC.

It was personal, but not so personal that it would keep people from being part of a system.

It could run the software of IBM's PC.

It performed all the user-friendly functions people expected. It was, in fact, even friendlier than IBM's machine.

It had a more comfortable keyboard. A more dramatic display of graphics. And it ran 50% faster then IBM.

And it could keep people in touch with the most valuable resource an organization can have—the main computer.

No matter whose big system they have.

Sperry *or* IBM.

Or both.

The Sperry PC.

Admittedly, big picture.

But then, that's what happens when you look at the forest. As well as the trees.

See how the Sperry PC can work for you. Call 800-547-8362, toll-free. Or write us. Sperry Corporation, Computer Systems, Department 100, P.O. Box 500, Blue Bell, PA 19424.

SPERRY PERSONAL COMPUTER SPECIFICATIONS

OPERATING SYSTEM	**KEYBOARD**
MS DOS Version 1.25 or 2.0 with G.W. BASIC	84 keys, 6 ft. cord
MICRO-PROCESSOR	**AUXILIARY MEMORY**
High-Speed 16-bit 8088	Up to two internal 5¼" diskettes 10MB internal fixed disk when configured with single diskette.
DISPLAY SCREENS	**USER MEMORY**
High Definition monochrome display.	Standard 128K bytes, expandable to 640K
High resolution color display.	**DIAGNOSTICS**
IBM compatible graphics.	Power-on self test
COMMUNICA-TIONS	**CLOCK**
Built-in Asynchronous	Time-of-day with battery back-up

IEEE selects two keynoters for April meet

LOS ANGELES — The Internal Revenue Service's associate commissioner for data processing and the executive managing director of Japan's Hitachi Software Engineering Co. will deliver keynote speeches at the First International Conference on Data Engineering here April 24-27. The conference, sponsored by the Institute of Electrical and Electronics Engineers' Computer Society, will be held at the Bonaventure Hotel.

M. Eddie Heironimus, who oversees national IRS computer services, will speak on "Information Resources Management in the Internal Revenue Service." Dr. Deuji Tajima, a leading force in Japanese software engineering, will speak on "Inside the Japanese Software Industry."

The registration fee is $125 for members and $150 for nonmembers. The registration deadline is April 12, after which fees will rise approximately 5%.

Registration may be made through the International Conference on Data Engineering, P.O. Box 639, Silver Spring, Md. 20901.

Usus announces president, board for current year

LA JOLLA, Calif. — George Symons, an independent consultant in Inglewood, Calif., has been elected president of the UCSD Pascal System User's Society (Usus) for 1984.

Other officers elected include A. Winsor Brown of Volition Systems, Inc. in Del Mar, Calif., as executive vice-president; Eli Willner of Datatronix, Inc. in New York as vice-president of member services; James Harvison of the University of Maryland as secretary; and Linda Haskell of Ticom Systems, Inc. in Marina del Rey, Calif., as treasurer.

Usus membership consists of 2,500 users of UCSD Pascal or derivative systems.

The next national meeting of Usus will be held in Oakland, Calif., April 13-15. It is scheduled to include tutorials, technical presentations, hardware and software demonstrations, special interest group meetings and software library exchanges. Usus members who preregister for the meeting will be charged $25; there is a $10 surcharge for anyone who does not preregister.

Additional information is available from Usus through P.O. Box 1148, La Jolla, Calif. 92038.

'Enhancing Creativity' focus of NCC '84

LOS ANGELES — The 1984 National Computer Conference will have as its theme "Enhancing Creativity," with increased emphasis on computer graphics and artificial intelligence, according to Program Chairman Dennis Frailey.

Speaking at a press briefing during the recent Office Automation Conference here, Frailey said the NCC program, slated for July 9-12 in Las Vegas, will feature more than 90 technical sessions in 10 tracks: hardware and architecture; computer communications; the automated office; information processing management; data base management; artificial intelligence; computer graphics and entertainment; educational and societal issues; personal computers; and software, which will make up the largest track.

NCC '84 will also offer a series of 18 Professional Development Seminars, four half-day and 14 full-day. The seminars are available at an additional fee of $75 for a full-day and $45 for a half-day seminar. For conference attendees, advance registration fees are $100, while on-site registration is priced at $125.

The keynote address at this year's conference will be delivered on the opening day by John Akers, president of IBM, while the traditional Pioneer Day on Wednesday, July 11, will honor the contributions of the Lawrence Livermore National Laboratory.

"Computing at The Lawrence Livermore National Laboratory" will focus on the importance of computers in the research conducted at Livermore as well as explore the beginnings of the laboratory.

NCC '84 is sponsored by the American Federation of Information Processing Societies, Inc., the Association for Computing Machinery, the Data Processing Management Association, the Institute of Electrical and Electronics Engineers' Computer Society and the Society for Computer Simulation.

No other 3270 protocol converter can match all these features.

Since 1977, hundreds of companies all over the world including Bell Labs, Citicorp, ITT, Litton, Westinghouse—have used Local Data products to make IBM communications easy and inexpensive.

We believe the DataLynx™/3274 is the best price/performance 3270 protocol converter on the market.

So, before you buy any other protocol converter at any price, compare the DataLynx/3274 features first. Then decide.

- SNA/SDLC or BSC protocols supported. SNA is PU type 2.
- BSC for EBCDIC and ASCII.
- 16 bit, 8 MHZ Intel 8086-2 CPU.
- Auxiliary printer support allows each async port to have a separately addressable 3287 type printer. This feature enables dial users to combine CRT and print data over one dial-up line.
- 80 types of ASCII async display terminals can emulate IBM 3278 display stations, and ASCII async printers to emulate IBM 328X printers.
- Micro to main-frame support with our FileLynx™/3278 program for the IBM PC and PC compatibles supports terminal emulation and file transfer (upload/download).
- Hard copy KSR support with our "Paper/3278".
- Unique "paging" feature supports emulation of *all* models of the 3278 display station.
- Pseudo-transparency feature allows host application to transmit character and control codes to async terminal devices (e.g. graphics terminals, graph plotters, mini-computers, high-speed printers with down-loadable forms control units).
- "Compu" support for micro, mini and instrumentation computers as terminal devices.
- Dual host support.
- PROM cartridge for easy user upgrade of firmware.
- Powerful, friendly configurator mode, using menus to allow parameter definition for sync ports, logical units, async ports and terminal characteristics, including help utility.
- Configuration values saved in non-volatile EEPROM.
- Monitor mode displays current status of all ports and logical units.
- May be connected to a host directly (in modem eliminator mode), or via modems on a dedicated multipoint or point-to-point line (dial-up or dedicated), via RS-232C sync ports.
- Data rates to 19,200 bps (sync & async).
- Async ports may be configured for any of 15 fixed bit rates or "autobaud", with or without parity checking, and with a specified character format.
- Simple DTE/DCE change on all ports.
- Flow control on async ports may be configured for physical and/or logical signalling.
- Virtual device support enables reconnect of dial-users independent of physical port.
- Security through dual level password protection.
- Emulation of standard 3278 keyboard functions is tailored for each supported terminal type.
- 25th status line emulation.
- SAS® graphics support.
- Base color support.
- 3278-5 (27 x 132 character screen) support on 9 channels with memory expansion option.
- LU configurator options provide support for various screen formats and printer page widths.
- Front panel includes 35 function status indicators.
- Self-test of channels, memory and firmware integrity is performed continually in background mode assisted by a "watchdog" timer.
- UL and FCC approved.

For more information about the remarkable DataLynx/3274 protocol converter, call or write today. And ask about our 30-day free trial program.

NEWS

CALL FOR PAPERS

THE INTERNATIONAL SPSS SOFTWARE USERS EXCHANGE (Issues '84)
Chicago, July 18

Issue '84 is targeted toward the following topics: information centers, census data applications, data base management systems interfaces, business graphics, econometrics, multivariate techniques, categorical data analysis, decision support systems, interfacing microcomputers, computer performance evaluation and statistical education.

Abstracts are due on March 31, and completed papers are due on June 1. More information or a "Call for Participation" that lists panels and poster sessions is available from Issue '84, 444 N. Michigan Ave., Chicago, Ill. 60611.

THE ELECTRONIC OFFICE EXPO AND CONFERENCE
San Jose, Calif., Oct. 16-18

The seminars, being held by Cartlidge & Associates, Inc., will explore the current and future needs of the electronic office environment. Qualified companies or consultants are invited to submit a 200-word abstract for consideration.

The deadline for papers is April 30. They should be sent to EOE Show Management, Suite 205, 4030 Moorpark Ave., San Jose, Calif. 95117.

SYMPOSIUM ON COMPUTER APPLICATIONS IN MEDICAL CARE
Washington, D.C., Nov. 4-7

Papers are solicited that report on original research, development and evaluation results that add to the scientific knowledge base or that survey the state of the art. All papers will be refereed, and papers accepted for presentation will be published in the proceedings.

Panel and workshop proposals are also solicited. All inquiries about deadlines, submission of papers and proposals should be made to Gerald S. Cohen, Program Chairman, SCAMC-Office of CME, George Washington University Medical Center, 2300 K St., N.W., Washington, D.C. 20037.

CONFERENCE ON INFORMATION SYSTEMS
Tucson, Ariz., Nov. 28-30

The Conference on Information Systems research conference will be sponsored by The Society for Information Management (Research and Education in Information Systems) and The Institute of Management Sciences (College on Information Systems), in cooperation with the Association for Computing Machinery's Special Interest Group on Business and Data Processing.

Papers are solicited that address the following topics: Theory of Information Systems: design, implementation and evaluation; Technology: advances and applications; Organizational and Social Impacts: promises, problems and solutions; Education in Information Systems: curricula, methods, assessment of needs, special challenges.

The program committee especially encourages submission of papers on the economics of information systems; information management within and across organizations; integrated computing/communications systems, especially office systems; management of technological innovation, including process innovations; development and evaluation of technology-user interfaces; evolution of information systems; national policies related to information technology; and strategic uses of information systems.

Papers should be based on the results of original research. The program committee especially encourages empirical research on the above subjects.

Full papers must be received by the program chairmen by May 7; all papers will be refereed by at least two independent reviewers. Notification of conference acceptance will be made by June 29.

Additional information is available from Professors John L. King and Kenneth L. Kraemer, Program Chairmen, Department of Information and Computer Science, University of California at Irvine, Irvine, Calif. 92717.

HUMANITIES AND TECHNOLOGY CONFERENCE
Marietta, Ga., Oct. 25-26

The Department of English and History at Southern Technical Institute is sponsoring a seminar on the interface of the humanities and technology, in conjunction with The Humanities and Technology Association.

Papers are invited that examine the integration of humanistic concerns and technological growth; the relationship between the humanities and technology as perceived by business and industry; ramifications of technology in ethics; history and philosophy of science, technology and architecture; public policy toward science and technology; curriculum design for the humanities and technology; roles and effects of technology in science fiction, American studies and popular culture; responses of literature, aesthetics and the arts to technology; and international technology transfer.

Abstracts should be sent by April 27 to Becky Kelly or Virginia Hein, Department of English and History, Southern Technical Institute, Marietta, Ga. 30060.

WILL THE AT&T BREAKUP MEAN AN MIS SHAKEUP?

You'll know, when you view "DIVESTITURE: IMPACT ON INFORMATION MANAGEMENT" Exclusively from DELTAK's Special Edition: Computerworld Reports.

The AT&T divestiture is undoubtedly the most earth-shaking event in recent business history. The repercussions will be felt throughout the telecommunications industry for many years to come. It will also profoundly change the way your company processes all forms of information. That's why you owe it to yourself to watch "Divestiture: Impact on Information Management," an up-to-the-minute half-hour video cassette report presented by DELTAK and CW Communications.

This month, you'll enjoy the invaluable insights of a respected communications consultant, and a major communications vendor whose company may benefit from the recent breakup. Your program host is John Gantz, noted MIS author and contributing editor of INFOWORLD magazine.

And be sure to keep watching, because more hard-hitting issues of Computerworld Reports such as DP/Office Automation Integration and The Maturing Information Center will be coming in the months ahead. Or, previously released Reports addressing major issues are still available including: The MicroMainframe Link, Integrated Microcomputer Software and Managing the Communication Network.

Remember, before the Big Breakup shakes your information system up, order "Divestiture: Impact on Information Management." Call DELTAK order entry at (312) 369-3000; (416) 678-9222 in Canada.

BGS SYSTEMS FOR DP MANAGEMENT

CALENDAR

WEEK OF APRIL 1

APRIL 1, DALLAS — **DSS-84 Fourth International Conference on Decision Support Systems.** Contact: DSS-84, 290 Westminster St., Providence, R.I. 02903.

APRIL 1-4, ORLANDO, FLA. — **Annual Convention and Exposition of the Electronic Funds Transfer Association.** Contact: Catherine Brown, Electronic Funds Transfer Association, Suite 8000, 1029 Vermont Ave. N.W., Washington, D.C. 20005.

APRIL 1-5, CINCINNATI — **Common '84: IBM Computer Users Group.** Contact: David G. Lister, Common, Suite 1717, 435 N. Michigan Ave., Chicago, Ill. 60611.

APRIL 2, HOUSTON — **MicroPCB.** Contact: EPS, Inc., Suite 1540, 110 Plaza, New York, N.Y. 10119. Also being held April 2 in Orlando, Fla., April 4 in Tampa, Fla., and San Francisco, April 6 in Miami, April 10 in Washington, D.C., April 11 in Los Angeles, April 18 in San Diego, April 24 in Hartford, Conn., and April 25 in San Jose, Calif.

APRIL 2, WASHINGTON, D.C. — **The End-User Revolution.** Contact: Technology Transfer Institute, 741 10th St., Santa Monica, Calif. 90402. Also being held April 9 in San Francisco, April 23 in Chicago and April 30 in Boston.

APRIL 2, PHILADELPHIA — **Introduction to Micros.** Contact: U.S. Professional Development Institute, Microcomputers in Government, Department AB, 1620 Elton Road, Silver Spring, Md. 20903.

APRIL 2, NEW YORK — **Introduction to the IBM PC.** Contact: Center for Advanced Data Processing, Inc., Suite 402, 450 Seventh Ave., New York, N.Y. 10123. Also being held April 4 in New York.

APRIL 2, NEW YORK — **Advanced Wordstar.** Contact: Center for Advanced Data Processing, Inc., Suite 402, 450 Seventh Ave., New York, N.Y. 10123.

APRIL 2-3, BOSTON — **Dbase II.** Contact: The American Institute for Professional Education, Carnegie Building, 100 Kings Road, Madison, N.J. 07940. Also being held April 5-6 in Salt Lake City, April 9-10 in Seattle, April 12-13 in Albuquerque, N.M., and April 18-19 in Houston and Indianapolis.

APRIL 2-3, MONTREAL — **Dbase II.** Contact: Center for Advanced Professional Education, Suite 110, 1820 E. Garry St., Santa Ana, Calif. 92705. Also being held April 4-5 in Kitchener, Ont.

APRIL 2-3, CLEVELAND — **Lotus 1-2-3.** Contact: The American Institute for Professional Education, Carnegie Building, 100 Kings Road, Madison, N.J. 07940. Also being held April 5-6 in San Diego, April 9-10 in Greensboro, N.C., April 12-13 in Kansas City, Mo., and April 18-19 in Detroit and Hartford, Conn.

APRIL 2-3, ARLINGTON, VA. — **Local Wideband Networks.** Contact: Phillips Publishing, Inc., Suite 1200N, 7315 Wisconsin Ave., Bethesda, Md. 20814.

APRIL 2-3, SAN FRANCISCO — **Computer System Security Management.** Contact: Center for Advanced Professional Education, Suite 110, 1820 E. Garry St., Santa Ana, Calif. 92705. Also being held April 4-5 in Los Angeles.

APRIL 2-3, CHICAGO — **Fourth-Generation Systems and Languages.** Contact: Datapro Research Corp., 1805 Underwood Blvd., Delran, N.J. 08075.

APRIL 2-3, CHICAGO — **Understanding Telecommunications Technologies for Nonengineers.** Contact: Telestrategies, Suite 102, 6842 Elm St., McLean, Va. 22101.

APRIL 2-4, NEW YORK — **Job Control Language.** Contact: Chubb Institute, 8 Sylvan Way, P.O. Box 342, Parsippany, N.J. 07054.

APRIL 2-4, RALEIGH, N.C. — **Data Communications Systems.** Contact: Center for Advanced Professional Education, Suite 110, 1820 E. Garry St., Santa Ana, Calif. 92705.

APRIL 2-4, LOS ANGELES — **Data Base: Technical Developments.** Contact: Software Institute of America, Inc., 8 Windsor St., Andover, Mass. 01810.

APRIL 2-4, CHICAGO — **Basic Programming.** Contact: Management Information Systems, National Easter Seal Society, 2023 W. Ogden Ave., Chicago, Ill. 60612.

APRIL 2-4, CHICAGO — **DP Quality Assurance.** Contact: U.S. Professional Development Institute, Quality Assurance, Department KLMNO, 1620 Elton Road, Silver Spring, Md. 20903.

APRIL 2-4, WASHINGTON, D.C. — **Structured Techniques for Fourth-Generation Languages.** Contact: Technology Transfer Institute, 741 10th St., Santa Monica, Calif. 90402.

APRIL 2-4, HOUSTON — **Data Analysis and Logical Design.** Contact: Learmonth & Burchett Management Systems, Inc., Suite 405, 2800 N. Loop W., Houston, Texas 77092.

APRIL 2-4, TORONTO — **Systems Project Management.** Contact: Association for Systems Management, 24587 Bagley Road, Cleveland, Ohio 44138.

APRIL 2-4, DENVER — **Data Processing Project Management Workshop.** Contact: The Seminar Broker, 3212 W. 133 Ave., Broomfield, Colo. 80020.

APRIL 2-4, LOS ANGELES — **Data Communications I: Basic Concepts.** Contact: Business Communications Review, 950 York Road, Hinsdale, Ill. 60521.

Personal Computers have opened up all kinds of possibilities throughout your company. Including some you'd rather not think about. Somehow a balance must be struck between the performance PCs offer, and the control you have to have in a local area network to make sense of the whole system. Somehow, costs, information and information processing resources have to be managed.

INTRODUCING THE NET/ONE® PERSONAL CONNECTION. IT'S SMART, FAST, AND SNA-COMPATIBLE.

The Net/One Personal Connection™ hardware is a high performance, 10 megabit-per-second, Ethernet-compatible Network Interface Unit (NIU®) in a plug-in board for IBM® Personal Computers. It packs enough microprocessing power on a single 52-square-inch board to offload all networking functions, so it doesn't consume any of the host CPU's resources.

With Net/One SNA Server software, a PC can emulate a 3278, and get a direct SNA route to the top. So the Personal Connection is a far-sighted solution when PCs need to share information and peripherals. And it's the *only* solution when PCs need to be mixed cost effectively into a high-speed corporate network with information processing devices from different manufacturers.

The Personal Connection can do it, because it's the *Net/One* Personal Connection. That means it not only does the job from PC-to-PC, it's the newest extension of Net/One, the general purpose local area network system that can turn *all* the equipment you have now, no matter who makes it, into a fully functional, high performance network. A Big Picture network. Broadband, baseband, fiber optics. Mainframe to mini to micro. Local to remote.

Now PCs can get into without getting

IT'S POWERFUL ENOUGH TO PERFORM IN HEAVY TRAFFIC.

The Personal Connection is impressive even if all you need to do now is hook up a few PCs. Our Diskshare™ software lets one PC act as a disk server and still function fully as a PC. A Printshare™ program lets a number of PCs share a printer effectively. Because the Personal Connection offloads networking functions completely, you're getting every ounce of performance from every machine as well as maximum network performance.

When you connect more than just a few PCs, or a few hundred, the Personal Connection's on-board intelligence and 10 Mbps transmission speed are more than impressive. They're critical.

The ability to handle heavy traffic, fast, and to fully integrate PCs into your corporate network—now, or later—gives you both the high performance and the manageability you need, no matter how many PCs come in the door. You get the shared access, fast response, and easy, transparent operation you're looking for. And you get better management of file storage, applications software, and costs.

HOW MUCH WOULD YOU PAY FOR A BOARD THAT DID ALL THAT?

The Net/One-Personal Connection board (Personal NIU™) and operating software are $850. Surprised?

If you're looking to harness PCs to a high performance network, or trying to solve networking problems of any kind, give us a call.

EDITORIAL

Ready for crush of change?

The recent Softfair '84 job fair held outside Boston was anything but kind to Cobol aficionados. In short, they found few help wanted shingles at the various recruitment booths, the nod instead going to those who had honed their Unix and C language skills [CW, March 5]. This is a nice situation for today's college grads, 80% of whom have been exposed to Unix, but a tough row to hoe for the 10- to 15-year programming "veterans" raised on Cobol.

The week before last month's job fair, IBM announced a series of mainframes as a replacement for a processor line it had been selling in volume for only two years.

Meanwhile, as noted in *Computerworld*, the Computer Dealers and Lessors Association is lobbying hard to change a portion of the federal tax code that currently allows computer owners to depreciate equipment over a five-year term. The association is arguing for a three-year depreciation that, given recent events, may still not reflect the reality of shrinking product life cycles.

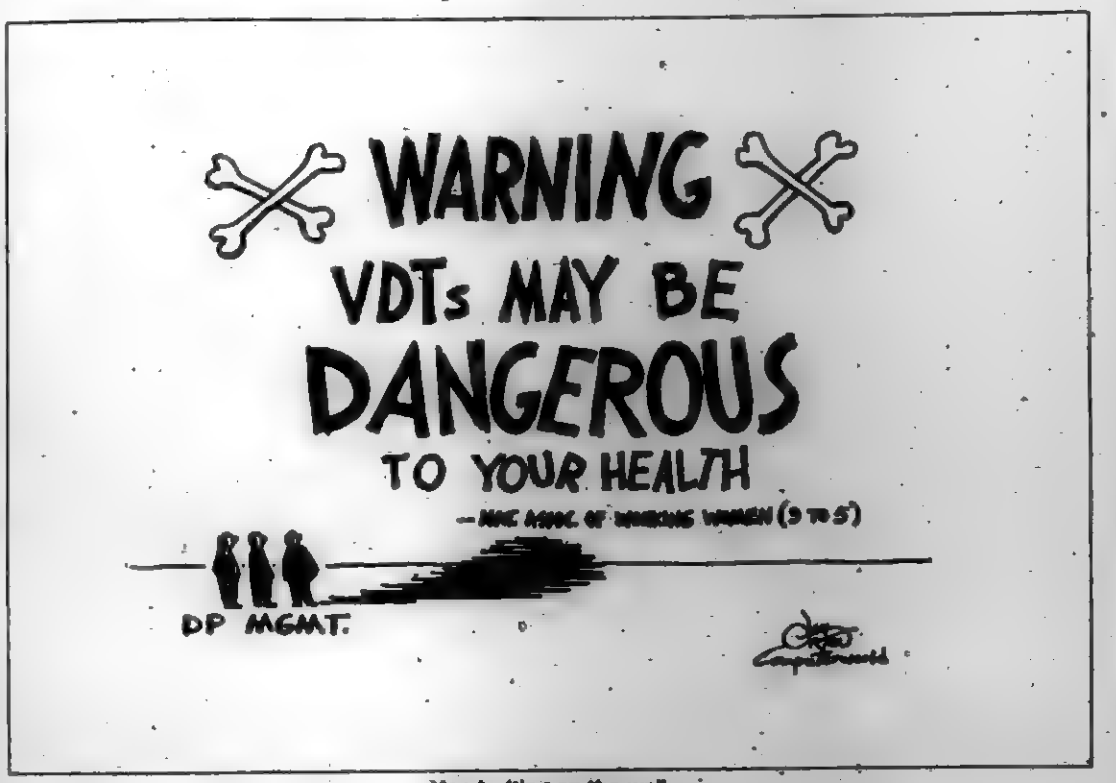
So what does all this mean? It means that the wise need not look far for evidence that the breakneck and sometimes frightening pace of technological change is accelerating. And data processing managers and MIS executives must quickly come to grips with a changing technological landscape in which words like "state of the art" have a fleeting meaning.

Thus, it is more vital than ever that DP managers stay current, which is as easy as saying America should stay strong, but about as difficult to accomplish. The coming generation of programmers, analysts and system designers will enter the job market technologically leagues ahead of their Cobol forebears. Are today's managers ready for them and for the crush of technological change that will accompany them?

In some ways, the DP community at large is anticipating and reacting to change, yet in other, more troublesome ways is choosing to ignore it. For example, at last fall's meeting of the Association of Data Processing Service Organizations, Inc., predominantly a vendor group, about half the work sessions and seminars were devoted to the implementation of microcomputers and end-user computing in general — a radical departure from the association's usual agenda.

But at last fall's annual meeting of the Data Processing Management Association, work sessions and seminars dealing with the implementation of microcomputers — perhaps the hottest issue in DP at present — were conspicuous by their absence.

If managers aren't going to deal with current, pressing matters, they probably won't do well gauging the impact of future change. Given the changes chronicled on a weekly basis in *Computerworld*, dealing effectively with what is known and anticipating the unknown will be a key to surviving in an increasingly tough business.



Handwriting on the wall

LETTER

Question of balanced reporting: a case of do as I say, not as I do?

In the editorial "The VDT scare: reason to pause" [CW, Feb. 27], *Computerworld* scores radio and television reporters because "few bothered" to balance reportage of "harrowing statistics" concerning alleged health risks of VDTs. This appears alongside quotes from a Columbia University physician who made clear at the same press conference that there is no "evidence of widespread pregnancy problems among VDT workers."

Yet *Computerworld*'s own story on the same subject in the same issue, "Survey by 9 to 5 links VDTs, health problems," also fails to quote the Columbia University physician. Furthermore, neither the story nor the editorial pointed out that the government has just completed an exhaustive review of the available evidence and concluded that VDTs show no signs of harming anyone.

Computerworld's editorial gratuitously suggests that the pregnancy problems attributed to VDTs might actually have been caused by "nearby radioactive wastes."

This is just as irresponsible as 9 to 5's allegations: No one has ever shown that "nearby radioactive wastes" have caused "pregnancy problems."

How can *Computerworld* expect the general media to report this sort of story in proper perspective when an important trade journal such as *Computerworld* fails to do so?

Critical success factors of quality programs

QUALITY
Wayne Smith

When considering how to implement a quality program in your information services organization, it is sometimes useful to examine first what the end result should look like. By "quality program" I mean a set of management techniques, organizational approaches, technical methodologies and administrative procedures that have been put in place in order to improve the quality, timeliness, cost and user satisfaction of your development and maintenance efforts.

The "critical success factors" approach to examining this question (discussed in John Rockarts' article in *Harvard Business Review*, March 1979) can lead to some very beneficial insights into how to go about establishing a program in your organization.

The critical success factors in any enterprise are those few items that must go well in order for that enterprise to succeed. In the context of a quality program, I mean those characteristics that, when present in a program, tend to ensure its success and when not present, the programs tend not to be successful. In other words, they are both necessary and sufficient conditions for a successful quality program. The critical success factors are commitment, organization and discipline.

Commitment required

Clearly, a key success factor is commitment. The more strongly the organization is committed to a quality program, the more likely it will be successful. Commitment is required at three levels in the organization: senior or executive management, information services management and information services staff. By "commitment" I mean not simply agreeing in the meetings that quality is desirable, but rather an allocation of money, time and staff at the proper levels and when it is needed.

It is interesting to note that experience indicates that the staffs of most information services organizations are strong supporters of these programs and tend to be the easiest to sell on the need for such a program. Frequently, there will be islands of enlightenment throughout the department that on their own have taken the initiative to embrace and even implement portions of an effective quality program.

The top level, or the executive management level, of an organization needs to be presold, sold and then resold on the value of the program and how it will be an asset to them in achieving their goals and not simply viewed as another in perhaps a long line of restraints that information services has placed on them. The only language to speak here is that of profitability; a technical discussion with them on, for example, how design reviews are critical to the process will be interesting, but will likely not be persuasive in the end. But a discussion on how the quality program will add 1% of sales to the bottom line by reducing failure costs can be very persuasive. In other words, the best way to persuade a business manager is with a quantitative approach, emphasizing the profit potential of a quality information services organization.

Finally, one must get the commitment of information services management itself. This step can sometimes be overlooked and, yet, these are the very individuals who may have to change the most. As a result, great care should be taken to ensure that the quality program is a practical, results-oriented process that helps, not hinders, them in delivering quality products.

How does one know when the proper level of commitment has been attained? Two signs are:

- The rapid adoption of a quality policy and quality program charter by the organization.
- The assignment of information services' best people to help in implementing the program rather than relegating it to some hapless programmer/analyst who happens to be free at the time.

Further placement

In addition to commitment, a successful quality program must be made physically part of the organization (especially during its early stages). This means that a separate function headed by a respected manager usually reporting to the head of information services needs to be established.

This strategy provides a funding base as well as a staffing base and serves as a focal point for the advanced training that will be required for the quality function's staff and as a control point for implementing the various mechanisms that will typically be required (such as project control, change control and risk management).

The particular placement and location of the quality function within the organization also serves to define better the scope of influence of the program across the company. Finally, the organizational unit will be the basis for future growth of the quality program and serves to ensure its long-term stability and viability.

While it's true that quality is everybody's job and not just the job of the people assigned to the quality function, nevertheless, a quality group placed high in the organization whose primary objective is to ensure that the program is implemented and to assist the various project teams in carrying out the program is critical to the success of the entire effort.

Furthermore, to help ensure the acceptance of the program and to deal more effectively with the legitimate process-oriented differences that may exist among the information services units that are affected by the quality program, it is essential to identify a respected individual in each of these groups to act as a quality coordinator or quality liaison. This individual works directly with the quality function and helps streamline the implementation of the program in his department. This person must also be a strong believer in quality, and his advocacy of its merits, practicality and long-term effectiveness together with his example will be critical to the successful adoption of the program by that department.

Moreover, the quality advocates in each information services unit can then meet to help solve common problems, share ideas and feed back modifications to the program, thus ensuring that the organization is getting the most value from the effort and not simply letting each unit treat the quality program as one more bureaucratic puzzle they must now solve any way they can.

Finally, successful quality programs have adopted a discipline that is used by the information services group to deliver their products. This discipline serves as an infrastructure of methodologies, techniques and procedures. It is usually embodied in a document that has been engineered in such a way that the various constituent methods all operate efficiently and practically and are not simply a hodgepodge of tools and techniques. Nothing turns off a project team more quickly than being required to follow a process that requires, for example, that the same data element be defined and specified in three or four different procedures.

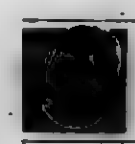
Invasion of technology gadflies



HUMAN CONNECTION
Jack Stone

The front door bell rings at the residence of George Smith, an honest, hard-working sort of fellow who has just finished dinner and is reading the evening paper. George peers through the window and observes a clean-cut-looking gentleman at the front stoop, dressed in a tweed topcoat with velvet collar and carrying a Gucci briefcase.

George opens the door and asks politely, "May I help you, sir?"

"Oh, no. The question is: 'May I help you?' My name is K. Armstrong Jones. Let me shake your hand, sir, and ask you a simple question: How would you like to make $10 million during the next two years for only a trivial investment?

"Now before you answer, and I suspect I know what your answer is, let me state that I happen to be a sales representative of the M & M brokerage house that is registered with the New York Stock Exchange and is, therefore, quite legitimate and specializes in the private placement of stock offerings from new firms whose emerging technologies represent the developing frontiers of the dynamically changing computer industry which, as you may know, is expected to grow into a major factor of the U.S. economy over the next 10 years, affecting the lives of every man, woman and child in the U.S. and, therefore, represents the outstanding investment opportunity of the century. And that is why I am speaking to you, although I must state that any official solicitation can only be made by prospectus, of which I have a number with me from companies that are seeking investors, and I firmly believe you are perfectly qualified to win this pot of gold. Any more questions?"

"I'm not altogether certain I know where to begin."

Jones reaches into his case, withdraws one of a collection of legal-looking documents and waves it in front of Smith. "Now here's one of my favorites. This company is establishing *Phoenix*, a new magazine designed to help computer users whose equipment suppliers have done the belly-up routine get the most power from their defunct systems. Initial research has indicated that this is an untapped market; potential readers may ultimately outnumber those of all computer-specific publications combined. I can cut you into the offering for five cents a share."

"Sounds interesting, but I somehow feel I would be more inclined toward an investment closer to the leading edge of things," Smith says.

"Sir, here is your answer," Jones responds, waving another document in Smith's face. "The Brazen Bunch. This is a newly organized firm of former teenage hackers who have solved the problem of software pirating. No more distribution of copyable disks, and no more customer hostility evolving from noncopyable disks. Instead, users merely transmit data files over satellite communications links to the Brazen Bunch's research facility in Palo Alto, Calif., and the technical staff takes over from there."

"It would surely appear that the firm has conquered the piracy challenge, but do you really think that the users would tolerate the delays in receiving their processed output?" Smith asks.

"Don't you appreciate that an awful lot of users will be so spellbound by transmitting their files by satellite that they won't care that much about turnaround time? The Brazen Bunch's business plan is a winner. In fact, I'm planning to invest in it myself. Want to go in with me?"

VIEWPOINT

Vendor training is part of implementation methodology

Kathy Cusch's and Kathy Telban's Special Report article "Poor training renders packages worthless" [CW, Jan. 30] missed an important point: Vendor training is not a stand-alone process, but part of overall project management and implementation methodology. Strong client project management is the key to successful package implementation, and training programs must be conducted within that framework. It is the vendor's responsibility to assist the client in the establishment of project controls and guidelines. It is the client's responsibility to furnish the required resources and work with the vendor to accomplish these goals.

LETTERS

In the training phase, this means that client and vendor must have mutually defined goals with methods and timetables for achieving them. The vendor can, and should, offer detailed manuals, lesson plans and hands-on experience, while the client should provide the attitudinal climate and resources that will motivate staff and ensure success.

The client should adhere to the implementation schedule, resisting the impulse to add enhancements or make last-minute changes until the project is completed. If the installation is sidetracked by such changes, training quality will suffer. Additionally, lack of coordination at upper management levels and low priority assigned to training are major obstacles to the effective implementation of a package.

As a vendor of sophisticated international banking systems, my firm has found that for effective integration of the training process with overall project goals, the client must:

- Provide a climate of senior management dedication and support.
- Produce personnel resources so that staff members assigned to the implementation and training team are aware that the success of the implementation, including training, is their main task. These people must be relieved of other daily responsibilities.
- Appoint a core group, knowledgeable in the application and capable of making required decisions to serve as the focal point of a training session and to transmit their knowledge to the rest of the staff.
- Insist on a hands-on approach on the supervisory or management level.

If vendor and client bring tested methods of project management to the training function, rather than treating it as the tail end of the implementation process, then we shall all, vendor as well as client, be better served.

IT'S EASIER WITH CPG.

Make the move to your IBM mainframe painless and productive. Buy CPG before you convert.

CPG is the on-line program generation system from Allergo Products. It's easier to use and far more machine efficient than UPO™, MANTIS™, or TRANSIV™. It's just the system you need to prepare for a bigger machine without bigger headaches.

- CPG is easy to apply. Existing programmers become on-line experts in 1-3 days.
- CPG automatically generates optimized re-entrant, multitasking programs. Easy to create. Easy to maintain.
- CPG is powerful. Includes arithmetic & Hexspeak output; simplifies screen-mapping & screen-editing; complex interfacing to TP system is handled by CPG.
- CPG is efficient. Standard processing routines and your common routines are incorporated into the Central Routine Library (CRL). This eliminates code duplication, loading and re-loading of common code at execution time.
- CPG programs are transportable. The CRL allows programs written in CPG to work under DOS or OS and run under CICS or SHADOW II.
- CPG is user-responsive. It allows you to develop, test and implement on-line systems in less than half the normal time, at the terminal before the user's eyes.

Whether converting or simply looking for an easy way to meet the on-line workload, go CPG. Go Allergo. Call for more information today.

"On-line programming was never easier than with CPG."

'I'd suggest waiting'

I think worrying about the year 2000, as demonstrated in the article "The problem you may not know you have" [CW, Feb. 13], is interesting, but I also think it's wrong. While there can be no denying that problems will occur, overtime will be paid and programmers will work two shifts, one wonders if anything can be done now.

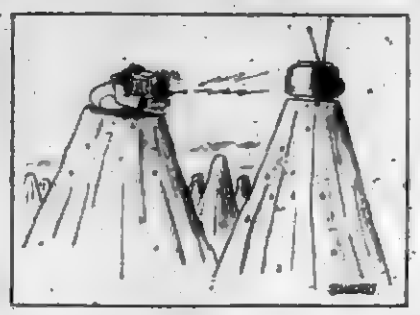
More harm than good can be done by worrying about it now, because programming errors will be made. What is the use of modifying a program, whose chance of life 16 years from now is dubious anyway, when it works fine now and can't receive "in-field" testing for 16 years?

What about the "Zip+4ing" of America's address files? I can remember many times laying out specs for an address file and wondering, "Should I make it nine, or should I make it five?" The reply was always the same: Make it five so it's compatible with all the other name and address files. Of course, that is a change that needs to be made all over, in thousands of shops.

So those of you who want to, go ahead and change your date algorithms now. But I'd suggest waiting.

Don't come crying to me the next time you have to convert data to and from external files and formats. Don't come crying to me when you realize that ever since "project early-kill," 1983 has come before 1984. And don't come crying to me when the year 2000 finally rolls around and everything goes wrong anyway. I'll be way too busy collecting overtime and working two shifts.

Russell Hoffman
Bridgeport, Conn.



VIEWPOINT

Security costs don't rise with more data protected

LETTER

After reading "A conversation with IBM's DeMaio" (CW, Jan. 30), I feel it is necessary to inform Computerworld's readers of what I consider to be seriously erroneous advice by DeMaio. I have been involved in the area of data security since 1970, when I was appointed manager of the Share security project. I guided the project in developing a series of long-range security objectives, which were published in 1973. In 1977, I designed and developed ACF2 — The Access Control Facility, an access control system for IBM's large computer systems, now installed in over 1,200 installations worldwide.

DeMaio seems to confuse the questions one would ask in order to classify data for security purposes with those one would ask for disaster recovery purposes. DeMaio asks that data users classify data into "really important" data so that if it were lost or erroneously changed, it wouldn't seriously damage the firm. These are questions one would ask in planning for disaster recovery, because this is a case in which there is a corresponding increase in costs compared to the number of applications that are considered crucial. In this case, data is either destroyed (lost) or it is not.

Data that is erroneously modified, either intentionally or unintentionally, can be an insidious cancer within an organization. Most corporate decisions are based on available data; records are relied upon by auditors; stockholders would like to believe the data they receive is accurate; and research projects' data is used in development and production decisions.

DeMaio bases his recommendations on the false assumption that security costs significantly more as the percentage of data protected rises. In fact, in order to justify this finding, IBM asked DP managers what percentage of data they would protect if the cost of data protection rose with the percentage. The answer IBM received was about 80%.

Who is going to decide which 80% should be protected, especially in the case of derivative or combined data? Where does the line of protected vs. unprotected get drawn?

IBM has designed its security products around this misguided philosophy. Since the products were designed in such a way that it costs significantly more as the percentage of data protected goes up, when using these products the costs do rise significantly as the percentage of data protected goes up.

ACF2 was designed with the assumption that all data should be protected by default. Partial protection of data was designed only for transition purposes to allow an installation to migrate smoothly from an environment in which no data was protected to a fully protected environment. With this system design, installations have found that the difference in costs between protecting some data and all data is negligible.

I'd agree with DeMaio that sometimes when an installation faces protecting all data it seems to be too large a task to get your arms around. But I'd suggest prioritizing data so that one can start the process of implementing security in a logical manner. Any progress toward the full security of all data protected is headed in the right direction. As each step is made, it reduces the corporate exposure, and each incremental step is worth it. And the installation has to decide only where to start the projection process — not where to stop.

Words Alone Don't Describe The Lasergrafix 1200 Printer.

The QMS Lasergrafix 1200 is a breakthrough in electronic page printing. But words alone just don't describe it. Because QMS designed the Lasergrafix 1200 to do so much more than words. With a built in intelligent controller that takes simple print commands through your normal data stream. Built-in applications firmware eliminates the need for additional software—and frees your computer's resources for other work.

The difference is graphic—for all your business, scientific and individual printing needs. Create forms that have multiple typefaces and letters up to ten inches high—all on the same line. CAD/CAM. Bit mapped and vector graphics. Pie charts. Bar charts. Even barcodes. At a crisp resolution of 90,000 dots per square inch. With a printing speed of 12 pages per minute.

And, of course, letter quality word processing.

The Lasergrafix 1200 interfaces with just about any computer system. With versatility that lets you take business graphics to the limits of your imagination. Ask for a demonstration. You'll discover that the whisper-quiet performance of the Lasergrafix 1200 speaks softer than words.

And says a whole lot more.

VIEWPOINT

MIS decisions can make or break a firm

THE DATA CENTER
John P. Murray

With all the options, not to mention the confusion, associated with the changing information processing hardware and software technology, the pressure on the MIS department continues to increase. MIS clients demand, particularly as they gain somewhat more sophistication, improved service, faster response time and more information in different formats, and they want, increasingly, to be able to do more on their own.

At the same time, the organization's financial members want to reduce expenses. Members of MIS want, for a variety of reasons, to move with the technology, to develop and test new approaches and to use state-of-the-art processes.

Given all of the above, the management of MIS departments must attempt to sort out all the issues and to recognize the requirement for at least the exercise of common sense, if not caution, in facing the dilemma of doing what is best for their organizations while still holding MIS expenses to a reasonable level. As technology advances, it allows more to become both practical and affordable. As this circumstance develops, there is sometimes an emphasis on moving ahead too rapidly, without a concrete plan or development of an attainable set of goals.

Clear picture

I am a strong advocate of the movement to a state-of-the-art environment to do away with obsolescence. I still hold that position. My interest here is to make certain that we in MIS management do our best to provide our organizations' senior management with the clearest picture possible of the long-range consequences involved in certain issues.

We cannot predict with any degree of real precision what will occur, but we do need to work to make senior management understand the long-term implications of what we are proposing and to alert them to the fact that the productive uses of information processing technology and the real benefits to be gained cannot be carried on in a stop/start fashion and be effective.

The use of expanding and improving technology presents real opportunities for organizations that will take the time and effort to understand what can be accomplished through its use and that will then take the appropriate initiative to use that technology to help drive the organization ahead.

Long-term costs, consequences

However, this exuberance to realize the potential payoff inherent in the uses of such technology must be tempered with an understanding of the long-term costs and consequences associated with its use or, perhaps more importantly, without its use. Too often, MIS management is less than completely candid with senior management in terms of the identification of actual ongoing costs of a particular technical approach to a given issue. Sometimes, to be fair, MIS management may not be aware of all associated costs.

Insofar as possible and practical, MIS management has a responsibility to senior management to identify the probable continuing costs associated with improvements in the technical environment of the organization. As an example, consider the issue of the installation and expansion of an information center function within an organization.

The benefits of such an installation can be great; they can be easily identified and achieved; selling the concept presents little difficulty to the MIS manager who does his homework.

Ongoing cost

However, there is an ongoing cost associated with the information center that should be brought to the attention of senior management. The point here is that senior management should understand the real implications (both positive and negative) of the installation of the information center.

If the function is successful, demand will grow and, as a consequence, so will overall costs. These increased expenses can, in any well-managed information center, be easily offset through the increased productivity realized in the information center. The point is, however, that the likelihood of the development of such a situation should be addressed for senior management well ahead of its occurrence.

There is a clear requirement to make certain that MIS planning is defined in such a way that it will, insofar as is practical to predict, help drive the organization to realize its goals.

The requirement for flexibility and the concomitant extra cost associated with that flexibility must be

Introducing Lear Siegler's 3278 Keyboard Compatibles

Easy to Look at. Easier to Use.

Now you can combine Lear Siegler's exclusive High Touch™ style with the convenience of true IBM 3278 keyboard compatibility.

The ADM 1178 and ADM 1278 video display terminals offer superior performance and ergonomic design. With standard protocol converters, they can interface with virtually any IBM mainframe to achieve substantial savings in hardware and operator training expense.

For conversational applications, the ADM 1178 can handle computer transmissions up to 19,200 baud without handshaking. It features five video attributes (underlining, blink, blank, reverse video, and dual intensity), the IBM extended character set, four cursor modes (block or underline, blinking or steady), and 24 Program Function (PF) keys and two Program Access (PA) keys.

The block mode ADM 1278 offers all the features of the ADM 1178 plus expanded editing capabilities and three variable format display memory configurations: 48 lines x 80 columns, 24 lines x 158 columns, and two pages of 24 x 80 columns. Flexibility that's ideal for word processing, financial spreadsheets, flow charts and other specialized applications.

Both the ADM 1178 and ADM 1278 are available with standard 12" green or amber or optional 14" screens, and can be modified easily for OEM applications.

These Lear Siegler High Touch terminals are made in America–designed, engineered, manufactured and shipped from Anaheim, California. With this total, on-shore capability, and a complete worldwide network of sales and service centers, OEMs as well as end-users can be assured of the best local support available in the industry.

Call our ADM 1178/1278 product specialists today for complete information on products and protocol converters.

Soup up your Volkswriter.

Everybody knows Volkswriter, the word processing software package that's become synonymous with high performance. Now, there's a way to get even higher mileage out of your Volkswriter. Hook it up to a Dataproducts P Series dot matrix color printer.

The versatile P Series translates the executive class, word processing capabilities of the Volkswriter into brilliant full color charts, graphs and text. It delivers a full page of text quality print in nothing flat while its sheet feeder automatically prevents loading hassles. And the P Series uses pin feed or plain paper and has the brains to fill every appropriate line with crisp, sharp copy, even if it has to justify to do it. And the P Series color printer has dual speed capability for correspondence quality output for the Volkswriter's many word processing applications and high speed output for draft and spreadsheets.

The Dataproducts P Series color printer. Think of us as a supercharger for your Volkswriter.

For more information go to your nearest computer store and ask about the Dataproducts P Series color printer, or call Dataproducts, 1-800-258-1386.

VIEWPOINT

MIS from page 28

spelled out to senior management. This issue should receive careful consideration from MIS management so that the case presented can be understood by senior management. The issues should be addressed in terms of dollars, rather than in terms of technology.

Adopting a too rigid or, even worse, incorrect course in the development of the MIS thrust for the future is not in the best interest of the organization. We must anticipate change — rapid and dramatic change in information processing technology.

Increasingly, we must work to make senior management understand and appreciate the long-term implications associated with decisions made about an organization's information processing effort.

Ultimate decisions

It seems just as valid to point out the real danger in doing nothing, or in "saving money," as it does to point out the glories of new technology. The ultimate decisions are, of course, the purview of senior management; MIS has a responsibility to point out all aspects associated with those decisions.

Too much rests on the course chosen for MIS not to press to develop the best possible understanding of the decisions' implications.

The long-term consequences of information processing's long-range course of action carry too severe an organizational impact to be ignored or misunderstood by the organization's senior management. These issues can impact the very existence of the organization. Incorrect or shortsighted decisions may very well mean the demise of the organization.

Increasingly, the actions of the organization's information processing planning and implementation efforts do take on a "bet the company" aspect.

Do it right, and the organization will grow and prosper. Do it wrong, and the organization will, at the very least, suffer. Somehow senior management must be made aware of this issue. ‡

Murray is director of management information services for Bayonet Corp., Madison, Wis., and author of Management Information Systems as a Corporate Resource, *published by Dow Jones-Irwin.*

QUALITY from page 59

Successful quality programs seem to have the characteristic that whatever discipline they have adopted quickly becomes a habit and is not continually thought of as another roadblock to overcome.

Also, this discipline does for each organization have a critical mass above which it will be unsuccessful regardless of the merits of its individual components. The critical mass can often be measured in terms of the size and the complexity of the methodologies and procedures within the discipline. It is, therefore, vitally important to assess the critical mass within your organization and to strive to ensure that the embodiment of your quality program discipline is below that threshold.

It is also important to understand that whatever discipline is established for the quality program must be made compatible with the philosophy and style of management exhibited by senior management. A quality program will have a low probability of long-term success if its underlying management principles fly in the face of the way the organization currently operates. Sometimes a management training program that serves to reorient company management may help mitigate the situation, but this substantially lengthens the process.

The most desirable enforcement mechanism for the discipline related to a quality program is based on each manager's own recognizance. However, due to many factors, this mechanism often needs to be supplemented. A useful technique is based on the concept of concurrence. Briefly, this revolves around a process whereby the quality function is jointly responsible with the project team for the success of the project or maintenance effort. The project manager is in charge, but the quality function serves to assist the team in ensuring that the proper risks are being accommodated and that the project's quality goals are being properly addressed.

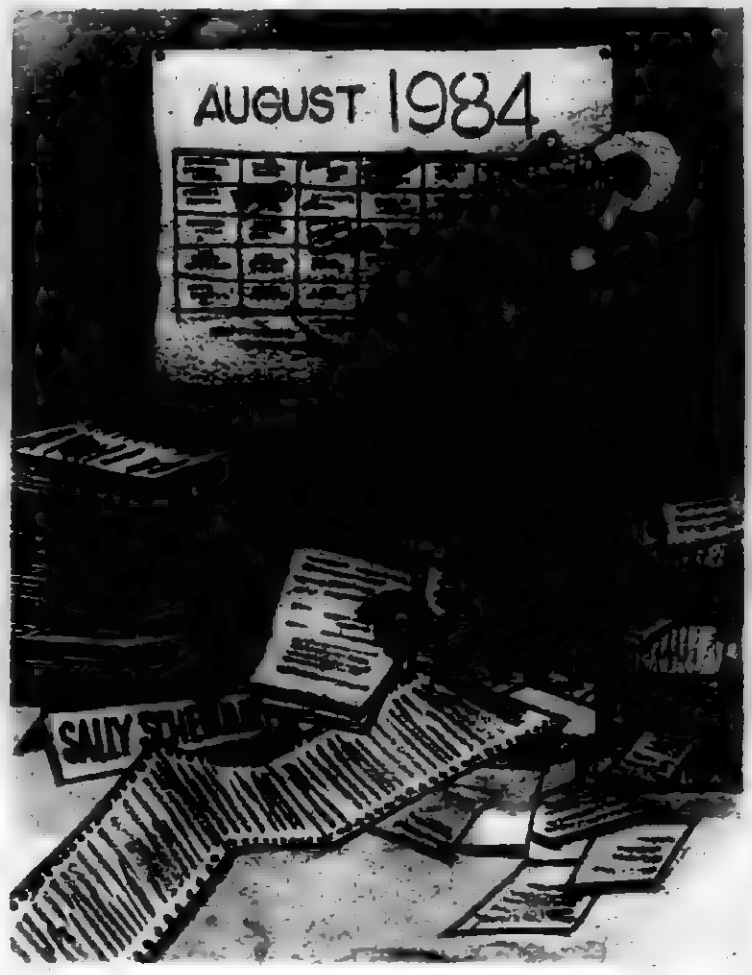
This variation tends to reorient the quality group away from being policemen, enforcers or after-the-fact memo writers (all chilling and low-productivity roles) and toward being partners in success. In addition, if differences of opinion arise, the mission of the quality function is to reach concurrence with the project manager, and only if that fails do they both simultaneously have an audience with the next level of line management.

The quality group must act very much like lawyers in the sense that they are obligated to assess risks on an effort and to offer solutions. But the final responsibility must be with the business manager or equivalent in determining the proper course of action. In other words, the quality function is obligated to provide the quantitative data by which senior management can make the informed decision.

Commitment provides the nourishment in the form of money, time and staff to initiate and sustain the program. Organization provides the structure for stability and a base for growth. Discipline provides the process for performance. ‡

Smith is vice-president, specializing in quality, at Applied Information Development, Inc. in Oak Brook, Ill.

Want Fast Relief From Your Scheduling Headaches?



APEX—Automated Production Control System. APEX is the most comprehensive production planning and workload management system available in today's market. APEX eliminates card handling and reruns due to setup errors, assures correct job sequencing, allows viewing of output before its printed, and provides immediate up-to-date status of all production processing. Some of APEX's powerful features include . . .

- Flexible Scheduling
- Interactive Job Setup
- Automatic Job Submission
- Automated Restart/ Recovery
- Online Output Review
- Management Reporting
- Single Source of Production Information for IBM 370, 303X, 308X, 43XX and all PCM's running under MVS, or VS1.

The first whole mirth computer-aided life catalog

BRADEN'S PLAYPOINT
Walter Murphy

The computer's end, by association, technology's impact on society has been well documented and recognized. Unfortunately, the impact for the most part has been in the business community. In *2001 — A Space Odyssey*, HAL took over when the going got rough. Now other computers have slowly begun to work with humans instead of for humans. Computer-aided design and manufacturing are as readily accepted as personal computers in the business community. With that in mind, the next wave to crash against the bulwarks of our lives will be computer-aided life, or CAL.

The primary criterion of any technological innovation should be that it improves the quality of life. CAL is the catalog for the high-tech lifestyle. Its CAL promise is incorporated into each product to make "Better living through technology" more than a slogan.

For the most part, technology has had little impact on the home. If we are to move into the next wave, consumer products must be at the breakwater. A few of the new home-use products to receive the CAL imprint will be: Florutech, Caring Rob, Distronics and FTP.

Digitized toothbrush

Florutech is a digitized toothbrush equipped with laser beam scanning capabilities to locate plaque and particles of food unseen by the human eye. The eyes may be the mirror of the soul, but the mouth is still the calling card. Florutech also comes equipped with a floss attachment and power pack so you can travel with the peace of mind that your dental hygiene needn't be neglected.

Caring Rob is the robotics child care system that is programmed to represent the parent as he wants to be remembered when he's not around.

The operating modes available are: Alan Alda Auto, for the sensitive and caring child; Clint Eastwood Correctional, for the unruly punk; and Hoigatron, for the take-charge type of kid. For each mode, Caring Rob is programmed for acceptable and unacceptable speech and behavior with appropriate responses and action. An early-warning system checks potentially disruptive or dangerous behavior by accessing memory and pattern recognition. Caring Rob takes the worry and bother out of child rearing.

Distronics is a complete line of formal dining utensils designed for those who are constantly dieting. Each utensil is equipped with a calorie counting device that, based on your desired weight, present weight, caloric intake within a 24-hour period and present attempt to place food in your mouth, will either allow you to continue or to become inoperative. When inoperative, a chemical process is initiated that causes the metallic content of the utensil to become so heavy that it is impossible to pick up.

An ear-piercing siren is also activated. This last option makes "midnight raids" impossible and painful.

Another Distronics option is Prodtronics, which is a voice simulator that chides you with the error of your ways with statements such as: "Do you really need that?" or, more forcefully, "You disgusting pig!" Distronics comes in over 100 registered patterns and will be available wherever Weight Watchers is sold.

FTP is the Food for Thought Processor, which provides you with a constant stream of mood-enhancing axioms. It is a product that combines the importance of information and its relationship to our moods. Simply, FTP broadcasts information

Who brings low-cost graphics together with the best names in software?

VIEWPOINT

over the home's intercom system. No matter what your mood, PTP will bring you out of it.

A wide selection of moods are available.

PTP is guaranteed to enlighten and inform.

Personal computers have really brought home the need for personal technology products. CAL's personal management products go one step further. Some of CAL's product announcements include PATM, Langlastics, Easy Golfer and Autoxpress.

PATM is the Personal Automated Teller Machine, which allows you to be a bank branch. Under a special licensing agreement with various national banks and the U.S. Treasury and Mint, PATM provides subscribers with instant access to their banking records and, for the first time, their money. The hand-held PATM is designed for satellite communications with your bank's headquarters from which you can access all your records for inquiry purposes. More important, due to the licensing agreement, actual currency can be printed at your PATM. Bank at home, in your car, at a restaurant, anywhere.

However, due to the unusual licensing agreements, PATM will be available only to those who qualify, the less stringent requirement being a million dollar bond be put up and held by the participating lenders. A small price to pay for the power usually available only to counterfeiters and federal employees.

Langlastics takes the worry out of learning a foreign language. Designed to look like a Sony Walkman, the Langlastics actually records any foreign language spoken within earshot and through a voice simulator translates the dialogue verbatim. This product is ideal for anyone who travels extensively or is paranoid about foreigners.

The autoresponse option translates your comments flawlessly. Never be embarrassed about your feeble attempts to sound sophisticated with remarks like: "Oh yes, the reindeer look lovely on my sister's pocketbook" or "Gosh, I am ruminating awfully." Langlastics makes the Berlitz School look like Mr. Rogers' Neighborhood.

Easy Golf is designed to take the drudgery and frustration out of the exciting sport of golf. You needn't spend hours practicing to be respectable or making excuses for missing easy taplins.

With Easy Golf, every shot you hit is a hole in one. Easy Golf can pay for itself with a few choice bets. Easy Golf is a set of three metal-seeking golf balls that when activated by even a child's tender tap are set on a direct course to the nearest hole. You could pick up extra cash with trick shots: Use a wooden cane on the front nine and test your skill with a tire iron on the back nine. You'll be at the 19th hole before your partners can say "Hey, that's cheating!"

The competitive challenge is still there as you devise ways to be creative. Caution: Due to the tremendous magnetic pull of Easy Golf's balls, jinksters cannot wear jewelry or other metal-based objects while in play. While testing Easy Golf, numerous injuries occurred to people unfortunate and tacky enough to be wearing chains while serious golfers were practicing their vocation.

For you and your car

Autoxpress lets your car say more for and about you. It is destined to be the citizens band radio of the 21st century.

From the console keyboard, you can display impromptu messages to those behind you via a rear-window-mounted screen display. It is more expressive than a bumper sticker, with only your imagination or vocabulary to limit your messages.

For example, it provides for affluent motorists an ideal opportunity to lord it over the proletariat with such jaunty displays as: HARVARD '74 or WE MADE MONEY THE OLD-FASHIONED WAY — WE INHERITED IT!

To improve the quality of life, Autoxpress is ideally designed to inform other motorists of the stupidity and arrogance of their driving styles. The highways are your canvas: Express yourself.

All CAL products include delivery and installation. Prices are subject to change without notice and on the whim of the designer.

Murphy is a consultant with a firm in New York.

Tektronix.

No graphics terminals connect you to better utility or applications software, or with a broader range of computers, than Tek's desktop 4100 Series terminals.

Among the dividends of Tek's long leadership in graphics are the scores of program development tools and powerful applications packages already on-file and immediately compatible with most computers.

From analysis to reporting; cartography to CAD: compatible software helped make Tek's low-cost 4100 Series an immediate success.

Major software vendors like ISSCO, SAS, Precision Visuals and many others offer 4100 users flexibility in data analysis and presentation.

In more technical, engineering and scientific environments, users can take advantage of ANSYS,™ PATRAN-G,™ ANVIL-4000,™ GEOMOD,™ Tek PLOT 10 Computer-Aided Drafting and Easy Graphing II.

Tek PLOT 10 graphics development software library is installed on more computers than any other in the world. It now includes the core standard IGL; the new international standard GKS and TCS, nucleus for scores of specialized packages.

The 4100 Series lets you take full advantage of all these powerful software resources.

Fast, flexible, and priced fully equipped from just $3995, quantity one, the 4100 Series includes VT100 compatibility and ANSI X3.64 text editing right along with its exceptional graphics.

Choose from a range of resolution, segment memory and color capabilities, backed by performance unique to the price range—including a flicker-free 60 Hz non-interlaced display. 38.4K baud communications. And color manipulation by keyboard function keys.

The companion 4695 Color Graphics Copier now makes color copies practical. It's a very quiet and reliable push-button easy desktop unit that doubles as an alpha-numeric printer. Single quantity cost is just $1595.

Powerful graphics team with Tek 4695 color copies and transparencies for a complete desktop analysis and presentation system.

Presentations come alive with the communications impact of full color transparencies that can be produced in minutes.

Your Tek Sales Engineer can help you find the perfect software for your computer, your needs, and our graphics. For literature or the location of your local Tek sales office, call toll-free: 1-800-547-1512. In Oregon, 1-800-452-1877.

The coming of age for communications: 1984

READER'S PLATFORM
Walter E. Ulrich

In communications, 1984 had been anticipated with dread by some people and enthusiasm by others. Now that the year has begun, it deceptively appears that little has changed. Data, text and voice are being transmitted the same way in January as they were in December.

Nonetheless, changes — fundamental and sweeping — have occurred. The basic premises of past communications decisions have been altered. The implications for users and vendors alike are nothing less than monumental. The procurement of telecommunications products and services is no longer the same. For vendors, there is a whole new complex set of challenges, problems and opportunities.

Nineteen eighty-four is different from previous years for three reasons. First and most obvious, on January 1, the divestiture of AT&T was completed. Second, the Federal Communications Commission began deregulating the communications industry with its Carterphone decision 15 years ago. Its efforts are just now being concluded. The coincident breakup of AT&T and the fruition of FCC competitive rulings represent an industry restructuring that is unparalleled in American history.

The third cause for this change is technological. Communications technologies are on-stream today that were unavailable one year ago. Cellular mobile radio systems are serving subscribers today in the city of Chicago. Digital termination systems offer an effective alternative to traditional local-loop telephone company plants across a community. More bandwidth is available today than ever before. Communications services now provide higher speeds, greater flexibility and lower costs.

Evolutionary changes have been occurring along with the revolutionary ones already described. Vendors are providing new and better hardware, software and services. Practical solutions can be developed for even the most complex problems.

The best news for communications users is that the competitive environment has had its intended effect. Communications prices are decreasing, and lead times are being reduced. Communications solutions can be crafted to meet a company's specific needs. As we collect and analyze more information, communications is providing an increasingly rich infrastructure to disseminate it. Properly designed, the cost per unit of communications will decline.

The bad news is that users will have to become masters of their own fate. Sole source procurements are neither wise nor practical. Freedom of choice implies a tyranny in which choices must be made, and there is a plethora of choices from which to select. Companies that choose poorly — or companies that fail to make a conscious choice — will find the cost per unit of communications increasing, perhaps drastically.

Network redesign

Networks that were designed in past years will have to be redesigned. The basic assumptions and underlying economics are different. Networks that were engineered in 1982 are no longer optimal in 1984. Network optimization now means more than juggling line speeds and changing node locations. A variety of different communications products and services should be mixed and matched for optimal function, flexibility and cost.

Competitive markets reward firms that are innovative, efficient and well managed. The rapid technological pace and fast-changing customer needs require insight. Effective marketing and promotion will be keystones to success.

Competition will be stiffer, but new markets will open up. Independent vendors will find selling to the former Bell operating companies easier. Consumers recognize the need for new communications, so the communications industry pie will be bigger for everyone.

Planning will be the key for users and vendors alike. The new communications must fit a user's information strategy. Information and communications are only effective so long as they advance and support the goals and objectives of the organization. Communications is the nervous system of companies: Failure to develop a communications plan can lead to a breakdown.

"Strategic planning," "product planning" and "business planning" are the bywords of successful companies in every industry. Vendors must understand their markets, their competitors and the technology.

This year represents a brave new world in communications. A certain courage will be required to face that world squarely. Everyone in the industry has his work cut out for him this year. ‡

Micro impishness brightens Softcon

Like a feisty young puppy in the company of a pack of trained hunting dogs, the microcomputer software industry has provided a spark of youthful impishness that is at times a joy to behold.

Nowhere was this more apparent than at the Softcon International Conference and Trade Fair for the Software Industry held in New Orleans last month. While Softcon '84 failed to live up to expectations in many areas, the show pointed out how strikingly different the microcomputer software business is from its mainframe counterpart. A carnival-like atmosphere infused the show, complete with clowns, giveaways, song and dance and an assortment of other gimmicks.

Trade journalists could come to New Orleans carrying a 4-in.-thick folder of mail announcing press conferences, exhibit locations or just plain seeking an interview with a company president. In the two weeks before the show, the telephone rang almost nonstop with entreaties from vendors.

Indeed, the publicity campaigns that preceded the show were often more imaginative than the show itself. Companies have undertaken an assortment of colorful advertising campaigns in attempts to distinguish their products in a sea of like-minded competitors. Messages arrived stamped on diskettes, T-shirts, coffee mugs and buttons. About a dozen vendors paid the extra $10 to have their publicity releases sent by overnight mail; other envelopes arrived by certified mail. One came special delivery, and four or five were marked "personal" in flowing penmanship.

While this Pepsi Cola-like display is at times tiresome, it points out the seriousness of the problem facing vendors in

Ironing out info center kinks

By Jean-Pierre Dubler
Special to CW$

The information center concept is fast making headway. Nevertheless, maintaining an information center still carries certain problems: How can quality service be provided? How can performance levels be assured? How can capacity be planned in response to this new type of demand, which is difficult to manage and places burdens upon corporate resources?

Futhermore, after recent innovations in the microcomputer market, especially the IBM Personal Computer XT/370, data processing specialists are faced with a short-term need to replace data center terminals with linked microcomputers, resulting in an additional series of problems — such as data distribution, security and risks in terms of incompatibility.

The following definition for an information center was adopted at a recent Share Conference for IBM users: "An information center consists of a facility and resources which can allow users to carry out their own data processing according to their immediate needs."

It would be appropriate to add "extensive" resources, because an information center, from the vantage point of a computer center, would initially seem to impose a heavy burden upon resources.

An information center requires numer-

'Primeway' transaction system debuts

NATICK, Mass. — Prime Computer, Inc. has announced a transaction development and management system which reportedly integrates programming development and execution into one process.

The Primeway transaction development and management system is designed for use on Prime 50 series superminicomputers under Revision 19.2 of Prime's Primos operating system.

For use in distributed or centralized data processing environments, Primeway is intended to ease software maintenance and modification requirements in high-performance transaction markets, such as banks, insurance companies, utilities, education and government.

Developed in Cobol '74, Primeway is said to provide a highly structured but flexible interactive development environment, according to a spokesman. Once an application is developed, execution reportedly is managed by the Primeway transac-

Setting the DP book straight

The latest fad is computer literacy. Enterprising vendors offer courses, books and seminars that promise quick enlightenment for the illiterate. But it appears to me that they have omitted some important, fundamental topics.

The latest computer literacy books have chapters about bits and bytes and disks and chips and even how to write programs in Basic. But they fail to mention the intangible parts of this business: the quaint quirks that affect the people who use hardware and software.

Take bugs, for example. The computer literacy books only briefly mention them. But data processing is a business in which our lives are controlled by those ornery creatures that inhabit both machines and programs.

We all know that software has bugs. The errant program often causes a pro-

BUGS from page 63

grammer to be called from a warm bed to come down to the shop because payroll just blew up and the checks must be ready in the morning. The computer literacy books don't mention midnight telephone calls. But it seems to me that any computer-literate person should know about them.

Hardware is pretty reliable these days, but even in machines there can be nasties.

Take the dreaded intermittent system. Every once in a while, usually while a critical program is running, the computer burps. Of course, when the engineer is there to fix the problem, it doesn't happen. The computer literacy books don't even mention this sort of thing. Some don't even let on that hardware might break.

Then there is program maintenance, also not discussed in the computer literacy books. Maintenance, as a proportion of total programmer time, is now greater than 50%. The computer literacy books, however, seem to imply that the job of programmers is to write new programs.

But that's not really the way it is. There's a big difference, one which the inquiring illiterate won't learn about from these computer literacy books.

Then too, the books don't mention one of our most shameful deficiencies: our inability to make reasonable estimates of programming time and cost. A program is promised in X months. After 2X months, we declare it to be ready, even though it is missing some important features.

And, of course, its cost turns out to be twice as much as our original budget. How can the reader claim to be literate if he doesn't know about our common failings?

Users blemished

Neither are the users themselves without blemish. Development programmers might wonder why the computer literacy books do not mention their most gnawing complaint: ever-changing specifications.

Every programmer has suffered the pain and indignity of preparing a program to the user's specifications only to find that when the user sees the output, he now has "just a few small changes." So the programmer retreats, hacks up the program and hopes that the result will not be too much of a monster. Often, however, the result is indeed a monster.

And how about programmer turnover? I could find no mention of it in the computer literacy books. There seems to be a large population of programmers who think that one year is a nice round number for job tenure. So the programmer quits halfway through an urgent project. Every programming manager has lived through more than a few of these nasty incidents, and his greying hair and sensitive ulcer attest to the severity of the practice.

Conversion

The books don't discuss conversion. Brought about by a momentous decision from somewhere on high, conversion requires that we stop what we are doing to spend hectic weeks or months transporting all of our fragile applications software to a new machine, operating system or programming language.

Most programmers are good for exactly one conversion. After that, they refuse to do another. And this, of course, leads to more turnover.

The computer literacy books I read contain several examples of programs; the largest is about a dozen lines. I am trying to remember the last time I saw a real program that was that small. Programs tend to be hundreds of lines; systems of programs have many thousands of lines.

Nor is programming speed discussed. The naive reader will probably get the impression that writing programs is almost as rapid as reading about them. But programming is arduously slow. Maintenance programming speed is measured in dozens of lines of code per week; development programming in terms of a hundred lines per week.

But the computer literacy book, with all of its miniature programs, can be read in about the same amount of time a programmer spends on his lunch hour.

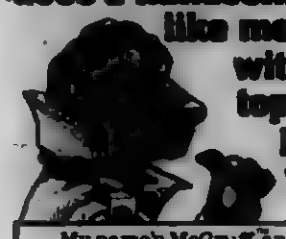
Gaps in education

There are so many other things that the literacy teachers have missed: the impossible deadlines that rob you of your sleep and perhaps even of your sanity and marriage; or the manuals which, though they may be massive tomes, just do not hold the answer to today's problem or, worse, are simply incorrect.

The purveyors of computer literacy education have a commendable goal. They want to teach people what computers are all about. It's too bad they haven't managed it.

Armerding, who spent a couple of decades supervising computer workers, now writes about them.

What business does a handsome dog like me have with a top cat like you?



My name's McGruff, and it's my business to help prevent crime. I think it should be your business, too—to teach your employees how to protect themselves. Just send for my business kit—it'll help you develop a program that teaches your employees how to make their homes burglar-proof, make their neighborhoods safer, even how not to get mugged.

So take the time, and...

TAKE A BITE OUT OF CRIME

MORE THAN LIP SERVICE.

The software programming tool that delivers what it promises.

Quikjob™

Quikjob is a one-step load and go program for one time report writing, fast file creation and dataset quick fixes for use with IBM Mainframes, UNIVAC 90 Series and System 80. • Uses free-format English-like language • Complete and fast, most programmers start using Quikjob after just ½ hour • Generates reports in hours, not days, and updates files faster than you might think possible • Rental or purchase basis • It's quick, complete, and affordable — as low as $125 per month! Try Quikjob FREE for 30 days and see for yourself. Over 1,000 users worldwide.

Call toll free 1-800-551-4444 for complete information.

CENTER from page 63

ous and diversified software resources that need many more instructions and much larger storage capacity for each transaction with a user than one would encounter with conventional transaction programs. It is necessary for information center products not only to meet the needs of basic data management systems, but to include a series of interpretive functions in order to establish a bridge between user languages and the machine's internal logic. Minor changes in specifications for high-level data processing operations can precipitate extremely lengthy modifications in the system's software.

Furthermore, software packages are generally designed for relatively intensive levels of use. For example, one company that had developed plans for an information center based on an IBM 3033 encountered a major obstacle in terms of scale: For an array containing 5,000 items, 25 seconds of CPU time was required for linear regression. But for approximately 10 items, linear regression required six seconds of CPU time. The same function could be completed more rapidly with a microcomputer outfitted with a simple tabulating unit.

The activities of nontechnical people drawing upon the resources of an information center result in a far less predictable work load for CPUs than those encountered with conventional applications. A given user may work intensively on days when completion of reports is required, whereas no work may be completed on other days.

This erratic quality introduces problems in terms of daily management of capacity unless powerful tools are available for program evaluation and statistical functions. In turn, users are inherently unaware of the work load they generate and are only conscious of problems with turnaround time. Obviously, an initial solution consists of creating oversized central storage capabilities, but significant investments are required.

Nevertheless, there are other means of overcoming this phenomenon, especially with good user training. While an information center allows nonspecialized users to work by trial and error, prudent recommendations may be needed for curtailing the impact of such trial and error on hardware use.

It is also beneficial to provide an information center "auditing" mechanism in order to attempt to identify the errors which occur most frequently. At the IBM Europe information center, an audit revealed significant deterioration of performance levels as a result of consultation of operation records. Thus, the proposed solution consisted of separating user data by periodic development of subsets of operation files.

It appears preferable to entrust this type of auditing to the information center staff, which would have the best rapport with users. It is also necessary for experts to analyse current procedures and to ensure that software packages clearly establish restrictive conditions.

Cahier is a senior writer at Le Monde Informatique, Computerworld's *French subsidiary. This article originally appeared in* Le Monde Informatique *and was made available to* Computerworld *as part of the CW International News Network.*

Pitfalls accompany micro integration

IBM's recent announcement of its VM operating system on the IBM Personal Computer XT/370 presents many opportunities for the information center. As micro power increases, it is logical to assume that more mainframe software will be ported downward.

However, from the DP department viewpoint, introduction of these new possibilities is accompanied by a range of other problems. The problem of support and maintenance of software is more complex. One possibility is to entrust this responsibility to information center personnel.

Another difficulty involves coexistence of microcomputer application software with CPU software and packages intended for the conventional microprocessing market. Until IBM and software firms develop bridges between their products, there is the danger of redundancy or incompatibility.

Links to the mainframe are also an immediate consideration. A British survey recently demonstrated that when an institution acquires personal computers, needs for links to central units develop during the subsequent six months.

New problems in terms of performance levels have also arisen, both in terms of microcomputers and in terms of networks. On the XT/370, I/O transfers continue to depend upon the speed of the Winchester disk. Peak volumes impose practical limitations on the number of microcomputers within a cluster. A high-volume local network component is not yet available for a distributed data processing arrangement.

One-Two Punch!

Charles River Data Systems OEM super microcomputers just keep leapfrogging the competition. Now it's a knockout combination of operating systems: UNIX System V on one hand, and real-time UNOS on the other.

UNIX System V for Development
Derived from AT&T-licensed UNIX System V, our new UN/System V includes a full set of UNIX development tools, Bell license, Berkeley extensions, access to UNIX application programs, and support for Fortran, RM/COBOL*, C, Pascal, BASIC, and Unify relational database.

UNOS for Real-Time/Run-Time
UNOS, our proprietary UNIX-compatible operating system, has real-time capabilities that UNIX can't offer. Capabilities, like eventcount synchronization, priority scheduling, and enhanced file system reliability, that are essential in industrial and scientific applications. And application programs written using UN/System V run under UNOS without modification and without a UNIX license, a saving that OEMs can pass on to customers.

Plus 32-Bit Power
UN/System V and UNOS run on our Universe 68 family of computers. They are true super micros, with a 32-bit, 12.5MHz 68000 processor, a second 68000 front-end processor, 32-bit 4Kb cache, 32-bit bus, up to 5Mb of 32-bit RAM, high-capacity disk drives, and 1.25 MIPS performance. Quantity-one OEM prices start under $10,000.

For more on UN/System V, UNOS, and Universe 68 computers, return coupon to Charles River Data Systems, 983 Concord St., Framingham, MA 01701. Or call (617) 626-1000.

CCA launches query tool for its Model 204 DBMS

CAMBRIDGE, Mass. — Computer Corp. of America (CCA) has announced a query and report writing tool for its Model 204 data base management system (DBMS).

Called Access/204, the product enables nontechnical users to scan their corporate data base, select specific data and reformat that data into reports, a spokesman said. The product can be used in conjunction with CCA's PC/204, which is a link between the IBM Personal Computer and the DBMS.

Access/204 uses "intelligent management views," which are logically related views created through a menu-driven process. Users can name each view using their own terminology. View names and descriptions are automatically entered into a list, eliminating the need to remember names, the spokesman said. DP departments maintain security and control of information.

To query the data base and format reports, users identify the information required through menu-driven programs. Data can be drawn from more than one data base, and calculations can be performed on the data. The user then qualifies the information selected and generates standard or custom reports, specifying layouts and functions.

Access/204 will be available in the second quarter of this year for IBM MVS, DOS and CMS operating environments. Prices range from $40,000 to $60,000.

Additional information is available from CCA, which is located at Four Cambridge Center, Cambridge, Mass. 02142.

SHOW from page 63

this exploding market. The small entrants in particular confront the imposing task of attracting attention in a market which is flooded with nearly 300 word processing packages and about 100 spreadsheets, according to a *List* magazine estimate.

In contrast, large system vendors have joined the marketing mainstream in recent years. With their audience well defined and their market relatively free of new competition, their ads and public relations efforts have taken on a slickness that has typically been more associated with the hardware world.

While mainframe software shows exude an air of stoicism, micro software shows appear more like a circus or perhaps a tryout for a Broadway show, with the actors all competing for the attention of a few talent scouts.

All this fun, of course, cannot continue. In time, the feared shakeout will occur; most of the vendors will go under or be swallowed by conglomerates; and the micro market will take on a slickness of its own.

But until then, this show of puckishness is perhaps just what the computer industry needs as it extends its hand to a new audience — the end user.

PRIME from page 63

tion monitor. It is also said to provide administrative facilities for operational control, security enforcement and transaction management.

Components reportedly include an automated application and documentation library and a screen editor that allows developers to paint and prototype screens for user approval.

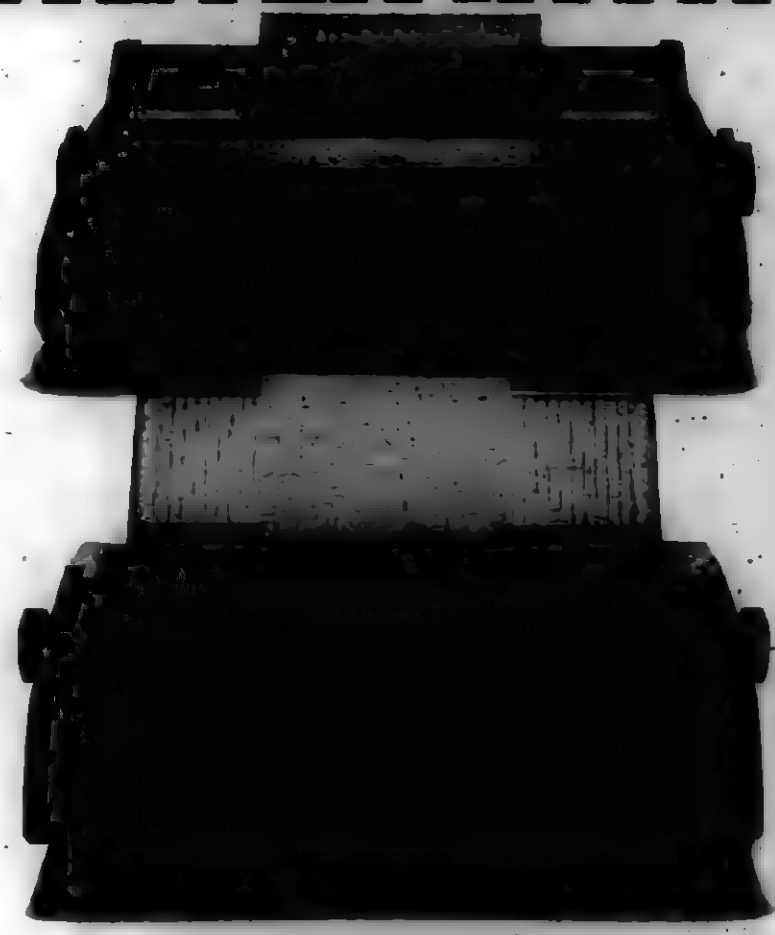
It is scheduled for availability with Prime Data Base Management System support during March and with Prime's Prism sequential access system support in the third quarter of 1984, according to Prime.

A combined Primeway Development/Execute package is priced at $55,000, and a Primeway Execute-Only package is priced at $9,600.

Prime Computer, Prime Park, Natick, Mass. 01760.

SPINWRITER INTR

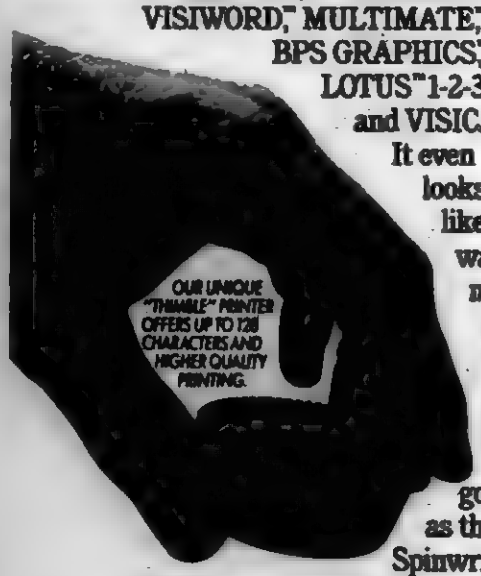
Now you have a choice of fully compatible Spinwriters for your IBM PC and XT.



NEC MODELS OFFER SPEEDS OF 200 AND 350 WORDS PER MINUTE.

First, a few words about the original, the Spinwriter 3550.

It was the first and only totally compatible letter-quality printer for the IBM PC. It plugs directly into the IBM PC and works with every piece of IBM PC software, as well as all popular third-party application packages, such as WORDSTAR,™ WORDPLUS,™ VOLKSWRITER,™ VISIWORD,™ MULTIMATE,™ BPS GRAPHICS,™ LOTUS™ 1-2-3,™ and VISICALC.™



It even looks like it was made for the IBM. Now, as good as the Spinwriter 3550 is, we recognize that a single printer can't take care of every business or professional office need. So we've added another IBM PC compatible Spinwriter: The 2050.

The new 2050 has a printing speed of 200 words per minute. And while it costs less, the print quality is still impeccable. So if low-volume letter-quality printing is what you need, the 2050 is your answer.

60 different print thimbles let your IBM PC look its best.

One of the things that gives our Spinwriter capabilities you can't even get on other printers is our unique "thimble." Each thimble holds up to 128 characters. You can even have two different type faces on one thimble or print multiple languages from a single thimble. Think of how handy

Publisher to expand on-line magazine service

By Jeffry Beeler
CW West Coast Bureau

BELMONT, Calif. — A publisher of on-line data bases plans to expand its existing services soon by making the full text of 120 general interest and specialty trade publications — plus their bibliographic citations — available to subscribers in electronic form.

In the past, the only on-line data Information Access Co. furnished about the 120 magazines was a catalog of bibliographic references. This spring, however, the company will enhance its data base by providing remote access to the articles within the publications, according to the firm's president, Morris Goldstein.

To take advantage of the combined text and bibliography feature, users must subscribe to Lockheed Corp.'s Dialog Information Service, a remote time-sharing facility specializing in bibliographic data bases. A licensing agreement allows Information Access' full-text files to reside in Dialog's National Advanced Systems Corp. AS/9060-based system and to be made available on demand to the company's subscribers.

For an estimated time-sharing charge of $60 to $90 per hour, customers will be able to use either a dumb terminal or a personal computer to gain remote access to the AS/9060 in Palo Alto, Calif. Subscribers can then summon to their display screens a bibliographic listing that reportedly uses the same generic subject headings as the Library of Congress.

Each bibliographic citation will correspond to a different magazine story and will include basic reference information such as the article's title, length, publication date, author and the name of the periodical in which it appeared.

By requesting the appropriate subject heading and perusing the accompanying bibliography, subscribers can quickly find out in which articles and publications a given topic has been covered. Then, from their terminal or personal computer keyboards, users can "flag" any article that especially interests them and transmit the desired text from Dialog's mainframe to their display screens.

Information Access is located at 11 Davis Drive, Belmont, Calif. 94002.

ODUCES A SPINOFF.

that would be if your business is international.

On the other hand if you have special printing needs, you can opt for a full alphabet plus numbers, sub- and superscripting and scientific and arithmetic symbols.

Incidentally, for all their versatility, our inexpensive

SPINWRITER OFFERS OVER 40 DIFFERENT TYPE FACES.

thimbles last for over 30 million impressions.

So it won't end up costing you a fortune to look like a million.

No matter what form your business takes, Spinwriter can handle it.

A Spinwriter can actually help you put your communications in better shape. It can use any of our nine interchangeable forms handling options. And they can all be easily installed and changed by the operator.

Want to dash off a few hundred original letters to your customers? Our sheet-feeder is just the ticket. It will print on your letterhead and second sheet or envelope.

Standard features include continuous forms handlers that take paper up to 16 inches wide, variable size forms, and multi-part forms.

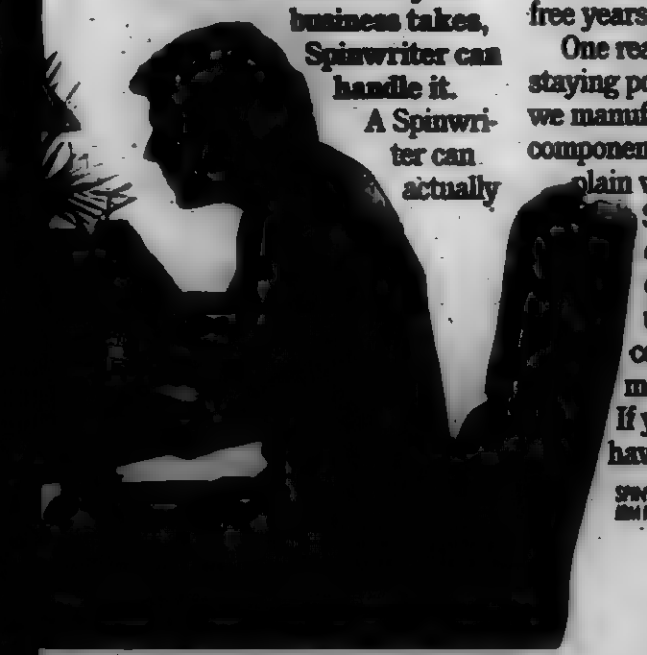
Spinwriters have a hard-earned reputation for reliability.

Spinwriters hold the industry record for mean-time-between-failure. Over 3,000 hours. Which, in terms of average personal computer usage, adds up to more than two trouble-free years.

One reason for Spinwriters' staying power is the fact that we manufacture every major component. It also helps explain why NEC Information Systems is the number one supplier of letter-quality printers to PC users in America. Of course, someday you may need a little service. If you do, it's nearby. We have a large group of NEC-trained professionals all around the country. It's also quick. Because of our modular design, normal repairs take less than 20 minutes.

9 DIFFERENT NEC-BUILT FORMS HANDLERS AUTOMATICALLY FEED ANY OFFICE FORM YOU HAVE.

You'll find Spinwriters at participating ComputerLand stores, Sears Business Systems Centers, IBM Product Centers nationwide, Entré Computer Centers and authorized NEC Spinwriter distributors. Or call 800-343-4418 for more information. And find out why more and more IBM PC users are saying, "NEC and me."



SPINWRITER CAN OPTIMIZE YOUR IBM PC CAPABILITIES.

ADR/DL out for IMS users

PRINCETON, N.J. — Applied Data Research, Inc. has announced an interactive, high-level application development program for users of IBM's IMS data base management system operating in an IBM mainframe environment.

ADR/DL reportedly provides application developers with an on-line environment under which high-level Cobol IMS programs can be created, tested and debugged. One of the program's facilities said to boost development productivity is a "program shell" concept whereby generic types of IMS programs are prerecorded in ADR/DL.

Another feature is a high-level IMS command set which is used to access IMS data bases. ADR/DL replaces the complicated IMS call parameters with high-level ADR/DL verbs, according to a vendor spokesman. The program reportedly expands the Data Manipulation Language (DML) verb into a full template for the IMS DML and all of its possible syntax options.

A permanent license for ADR/DL costs $35,700 from Applied Data Research, Route 206 and Orchard Road, CN-8, Princeton, N.J. 08540.

Info services market forecast: selected delivery modes, 1983-84

Cross-industry mart seen continuing growth rate

By Paul Gillin
CW Staff

MOUNTAIN VIEW, Calif. — In contrast to some recent reports predicting a slowdown in software expenditures, a report released here by Input, Inc. anticipates that the cross-industry software market will continue a strong growth rate over the next five years.

The "Cross-Industry Market" section of "U.S. Information Services Markets, 1983-1988" predicts that cross-industry applications expenditures will grow at an annual rate of 21% through 1988. However, the report cautions that growth has indeed slacked off in certain segments of the industry. In all, cross-industry applications will comprise $34 million of the $83 million spent on information services in 1983, the report stated.

End-user oriented tools will lead the growth parade, averaging 29% annually, the survey predicted. Other high-growth areas are in planning and analysis applications for end users, value-added networks and education and training software.

Several major trends are worth noting as the cross-industry market develops, the report continued. Related applications increasingly will be integrated through a data base management system. Vendors will expand into new delivery modes, including remote computing services (RCS) and microcomputer software. Micro links to central data bases and fourth-generation languages will proliferate as end-user computing continues to drive the market.

In the systems software market, the areas most closely tied to end users will grow the fastest, the report stated. These include application development tools, with an annual growth rate of 33%; systems control software, 24%; and data center management software, 22%.

Among popular new fields that will emerge are advanced office functions, such as optical storage devices and data base management machines, high-level languages and network control software.

The applications software market is "exploding on many fronts," making it the fastest growing cross-industry delivery mode, the report observed. This sector will grow at an annual rate of 30% to $8.2 billion by 1988, with strength in both the large systems and microcomputer sectors. Education and training software will lead the way with a staggering 63% annual growth rate on microcomputers and 44% on large systems. It will be closely followed by planning and analysis applications and accounting software. Both of the latter categories will grow at an annual rate of 50% over the next five years, the report said.

The largest growth rate variance is found in the RCS market. Both value-added networks and on-line data bases stand alone in their delivery methods and will grow at healthy rates of 27% and 22%, respectively, the survey predicted. However, RCS applications in the engineering/scientific and accounting areas will grow more slowly as competition emerges from other delivery modes.

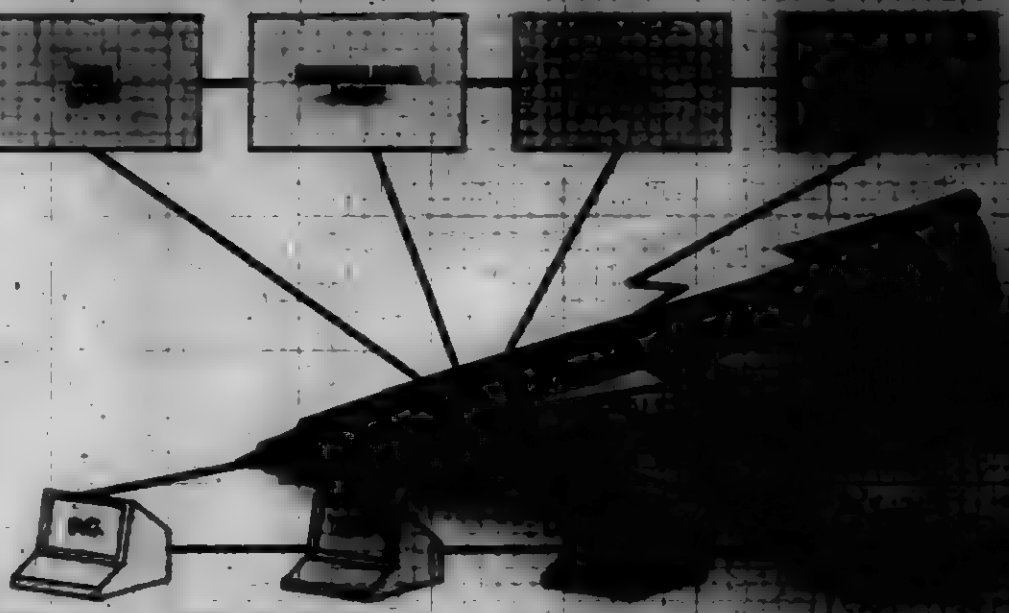
The end-user computing revolution will drive expenditures upward in the area of planning and analysis, with a 28% annual growth rate predicted. Software of this kind for microcomputers will experience a "spectacular 51% annual growth rate to become a $1.5 billion market by 1988. Large system planning and analysis software will log a healthy 33% annual growth rate, according to the report.

Value-added networks will "explode" from a $260 million market in 1983 to a $1.3 billion market in 1988,

See GROWTH page 69

Draw Your Own Conclusions.

With The Network Communications Processor, The Lines Of Communication Go Anywhere You Want.



Let us introduce the next generation of communications processing. It's a product so versatile that it can support multiple and dissimilar protocols at the same time—IBM 3270 BSC, SNA, Burroughs, ASCII Start/Stop, ICL, and many others. A product so powerful that it can network together up to 8,120 workstations and hosts of various kinds. A product so affordable that you can start using it for as low as $7920.

It's the Network® Communications Processor from Tri-Data. The first product that makes it both practical and economical to build networks out of dissimilar hosts and workstations.

With it, you can draw your own conclusions. Because the Network Communications Processor is a single solution you can use in a number of ways: right now—as a gateway, a cluster controller, an X.25 PAD, even as a packet processor where its cost can be [illegible] Tri-Data's. It's a high throughput [illegible] can be easily customized or upgraded as [illegible]

As an OEM or systems integrator, you can [illegible] Network Communications Processor to enter new markets, quickly and profitably. Or to capture a more competitive position in an existing market. As an end user, you can use it to increase utilization of installed equipment and achieve significant savings from equipment purchases and [illegible]

The Network Communications Processor. Call or write today for more information. The conclusions you draw will be money in the bank.

Micro-mainframe link unveiled for users of Ramis II, IBM micros

PRINCETON, N.J. — Mathematica Products Group, Inc. has announced a microcomputer-to-mainframe link for users of its Ramis II data base management system (DBMS) and the IBM Personal Computer and Personal Computer XT.

A spokesman said the link — dubbed Ramlink — allows bidirectional data transfer between a number of Personal Computer software packages on the micro and Ramis II on a mainframe. Simple commands reportedly control the uploading and downloading of data between the mainframe and the Personal Computer diskettes or hard disks.

The spokesman said data transfer from the mainframe to the Personal Computer is requested by adding a transfer phrase to a standard table request, allowing all data access and manipulation facilities of Ramis II to be employed in gathering data. Ramlink reportedly enables Personal Computer data to be used directly as transactions in a mainframe file maintenance request.

Ramlink is said to reformat data automatically for a variety of Personal Computer software products, including Lotus Development Corp.'s 1-2-3 and Visicorp's Visicalc. Through Ramis II, Ramlink reportedly also provides access to mainframe data stored in Ramis II data bases; IBM's Vsam, Isam or sequential files and in IBM's IMS and DL/1; Cullinet Software, Inc.'s IDMS; Cincom Systems, Inc.'s Total; and Software AG of North America, Inc.'s Adabas data bases.

The spokesman said that with Ramlink, Personal Computers and CRTs have full screen IBM 3270-type terminal access to all capabilities of Ramis II on the mainframe through a modem, requiring no additional protocol conversion hardware.

The mainframe Ramlink component is priced between $4,500 and $9,000, the spokesman said, based on the performance level rating of the CPU. The Ramlink floppy diskette for the Personal Computer is priced at $185 per unit. More information is available from Mathematica Products Group through P.O. Box 2392, Princeton, N.J. 08540.

Seeking tales of software

Computerworld's May Special Report will take a close look at software productivity, something our readers are continually trying to improve.

The Special Report will focus on application backlogs and the efforts being made to reduce them; the programmer shortage and whether it really exists; high-level languages and structured programming; and code generators and reusable code.

Contributions being sought for the Special Report should take one of two forms: a tutorial article discussing an issue or trend or a user application story outlining a particular firm's experience.

Articles must be typed, double-spaced and no longer than eight pages. Artwork, such as charts, graphs or photos, is encouraged. Authors should include a brief biography and a telephone number where they can be reached.

The deadline for submissions is March 23, addressable to Donovan White, Special Reports Editor, *Computerworld*, 375 Cochituate Road, Box 880, Framingham, Mass. 01701.

GROWTH from page 68

a 36% annual increase. The industry-specific sector of this market will lead the way with a 66% annual growth rate, the survey stated.

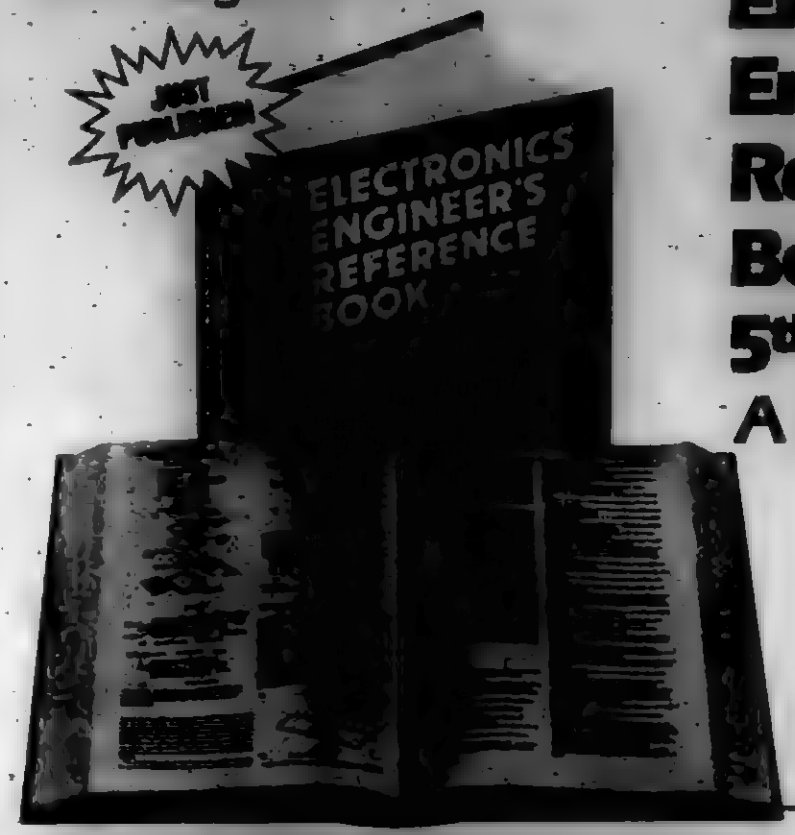
Some of the more interesting new developments in this area include the emergence of "one-stop" services, which include professional services, mainframes and custom or packaged software. Another development worth watching is the trend among "second-tier" vendors to become resellers of value-added networks offered by the market's major players.

The report is divided into two parts covering cross-industry markets and industry-specific markets. Each part costs $2,500. The entire report costs $4,000.

Input is located at 1943 Landings Drive, Mountain View, Calif. 94043.

"Well, good luck at the computer company."

Find formulas, relationships and facts on new technologies FAST in—



Electronics Engineer's Reference Book, 5th Edition

A $119.00 value

yours for only

$2.95

when you join Electrical and Electronics Engineering Book Club. You simply agree to buy 3 more books—at handsome discounts—over the next 12 months.

Stay on top of your field with—

- The most comprehensive, authoritative electronics engineering volume available.
- 800 pages; 32 sections; over 1,000 photos, diagrams, charts, graphs, and tables.
- Thousands-upon-thousands of ready-reference entries compiled by 70 internationally distinguished experts.

The #1 Choice of Engineers

For the past 20 years, engineers around the world have turned to the Electronics Engineer's Reference Book for reliable information on—

• Techniques • Physical Phenomena • Materials and Components • Electronic Design and Applications.

More Valuable Than Ever

To keep pace with the rapid technological explosion that has affected every area of the electronics engineering field, the 5th Edition now features 32 all-new sections on—

• Inductors and transformers • Printed circuits • Power sources • Microwave semiconductor devices • Hybrid, digital and linear ICs • Semiconductor memories • Microprocessors • Control systems • Satellites • Point-to-point communication • Computers • and much more!

Step Up To Career Growth.

Membership in the Electrical and Electronics Engineering Book Club provides a foolproof system for acquiring all the engineering know-how you'll need to stay up-to-date on new concepts, techniques and practices constantly being developed in your field. Begin enjoying the club's benefits by taking this $2.95 offer. It's a tremendous bargain *and* one of the most important additions you'll make to your professional library this year. Don't delay —mail the coupon today!

ASSURANCE: BENEFITS • In addition to getting the new Electronics Engineer's Reference Book for only $2.95, when you join, you keep saving substantially on the books you buy. • Also, you will immediately become eligible to participate in our Bonus Book Plan, with savings of up to 70% off the publishers' prices. • At 3–4 week intervals (15 times per year) you will receive the Book Club News, describing the coming Main Selection and Alternate Selections, together with a dated reply card. • If you want the Main Selection, do nothing and it will be sent to you automatically. • If you prefer another selection, or no book at all, simply indicate your choice on the card, and return it by the date specified. • You will have at least 10 days to decide. If, because of late mail delivery of the News, you should receive a book you do not want, we guarantee return postage.

Electrical and Electronics Engineering Book Club

Riverside, New Jersey 08075

Please accept my application for trial membership and send me the new Electronics Engineer's Reference Book (#1468) for $2.95. This massive volume contains 32 sections and over 1,000 diagrams, tables and charts. I agree to purchase at least three additional Selections or Alternates over the next 12 months. Savings range up to 30% and occasionally even more. My membership is cancelable any time after I buy these three books. A shipping and handling charge is added to all shipments.

No-Risk Guarantee: If you are not satisfied—for any reason—you may return the new Electronics Engineer's Reference Book within 10 days and your membership will be canceled and you will owe nothing.

SOFTWARE & SERVICES

SYSTEMS SOFTWARE

TONE SOFTWARE CORP.
Flasher

Tone Software Corp. has announced software for time-sharing users operating under IBM's System Productivity Facility (SPF) or Interactive System Productivity Facility (ISPF). The product, called Flasher, reportedly speeds access to spooled output data sets.

According to the vendor, Flasher provides users with an alternative to SPF and ISPF's outlist utility, which retrieves and displays spooled data. It also reportedly aids the manipulation of spooled data sets with user controlled menus and may be installed on any currently supported release of IBM's MVS operating system, including MVS/XA. All currently supported releases of IBM's SPF and ISPF products running under IBM's TSO or Tone Software's Tone 4 may be used with Flasher, the vendor added.

A Flasher version for IBM's JES 2 is licensed for $2,500. An IBM JES 3 version is licensed for $5,500.

Tone Software, 1735 S. Brookhurst, Anaheim, Calif. 92804.

PRODUCTIVITY AIDS

GT SOFTWARE, INC.
Release 4.5 BMS/GT

GT Software, Inc. has announced Release 4.5 of Basic Mapping Support (BMS)/GT, a screen generator for IBM 3270 and compatible terminals under IBM's CICS.

With BMS/GT, a spokesman said, a user designs a map on the terminal by keying in data as it should appear in final form. The system supports line replications, full naming conventions, page building, headers and trailers and the ability to retrieve any BMS-compatible map.

A permanent license for BMS/GT, which is compatible with IBM's CICS 1.4 and up, is $5,500 for IBM's DOS/VSE operating system and $6,900 for IBM's VS/1 and MVS operating systems.

GT Software, 1965 N. Park Place, Atlanta, Ga. 30339.

APPLICATION PACKAGES

JOHN MCLEAN & ASSOCIATES
Opticalc Jr.

John McLean & Associates has announced a simplified version of its Opticalc electronic spreadsheet program for minicomputers.

Opticalc Jr. reportedly offers 260K-byte spreadsheets with 16,002 entry positions allowing the user a choice of algebraic or reverse Polish notation, the ability to read Ascii or Software Arts, Inc.'s DIF files, 12 formats, 20 functions and locked titles.

Other features are said to include value referencing, spreadsheet rearrangement and independent display windows.

According to the company, it is upgradable to the regular Opticalc program or to the Optiqube program level.

It is designed to run on the Hewlett-Packard Co. HP 3000 or on the Digital Equipment Corp. VAX-11 superminicomputers.

Now available, Opticalc Jr. is priced at $500 through March 30 and at $900 thereafter.

John McLean & Associates, P.O. Box 270507, Houston, Texas 77277.

MAYZIMA & CO.
TCPS

Mayzima & Co. has announced its Traffic Citation Processing System (TCPS) for the IBM System/34 and System/36.

The package is designed to process traffic citation data, the vendor said, and is an interactive, multiuser system. TCPS is menu-driven and supports multiple processing locations. System features include fully integrated cash receipting and automatic generation of delinquency notices.

Court appearance dates, locations and times are tracked for arraignments, hearings, trials and sentencing, as well as continuance. The vendor said appearance notices are automatically generated through a set court dates function. Inquiry functions allow access to citation data by citation number or

SOFTWARE & SERVICES

by browsing the file for the offender's name.

Pricing for TCPS begins at $18,500.

Megavisa, 811 N. Ridgewood Ave., Daytona Beach, Fla. 32015.

DECISION GRAPHICS, INC.
Fames

Decision Graphics, Inc. has announced an interactive graphics package designed to allow corporate and government facilities managers to develop space management reports and plans.

Fames is designed to run on Digital Equipment Corp. VAX-11 superminicomputer systems with a variety of terminals and plotters.

It is said to let the user enter, store and report on all space in a facility and to use graphics and menu controls. It uses colors to differentiate the floor plan underlay, space allocation overlay and text information.

Prices range from $10,000 to $30,000.

Decision Graphics, P.O. Box 306, Southboro, Mass. 01772.

BARRISTER INFORMATION SYSTEMS CORP.
Management reporting package

Barrister Information Systems Corp. has introduced a management reporting package for law firms.

The package, which is for use with the vendor's financial management system, consists of five reports and provides an analytical breakdown of attorney performance for specified time periods.

The package runs on the Barrister turnkey minicomputer system.

The management product is licensed at $4,000.

Barrister Information Systems, One Technology Center, 45 Oak St., Buffalo, N.Y. 14203.

EDP CONSTRUCTION SYSTEMS ROI/2000

EDP Construction Systems has introduced Return on Investment (ROI)/2000, a menu-driven financial modeling system developed for the real estate development industry using Hewlett-Packard Co. HP 3000 processors.

ROI/2000 is for planning, analysis and control of land development and residential construction projects, including all commonly used cash flow, profit-and-loss and balance sheet accounts and categories, the company said.

The product is available in a land and housing model for $30,000 or an individual model for $20,000.

EDP Construction Systems, 2910 E. Camelback Road, Phoenix, Ariz. 85016.

AMERICAN DATA CONSULTANTS
Vertical market packages

American Data Consultants has announced eight vertical market packages which run under the Unix operating system.

A pharmacy package costs $5,000. A nursing home charting package costs $2,500. There are three versions of its preventive medicine package: for one to three doctors, $7,500; four to six doctors, $10,000; and more than six doctors, $12,500. A Class II & III trucking package costs $5,000. An accounting package has five modules which cost $1,200 each: general ledger, accounts payable, accounts receivable, payroll and inventory. A municipal system with utility billing costs $3,500, while a municipal accounting module costs $2,400. A title insurance system costs $10,000. A mortuary package costs $5,000.

American Data Consultants, 112 E. 32nd St., Joplin, Mont. 64801.

CATRONIX CORP.
Catsolid

Catronix Corp. has announced that its Catsolid three-dimensional solids modeling software is now available for use with Apollo Computer, Inc.'s Domain 32-bit engineering workstation.

A spokesman said Catsolid allows direct transfer of data from its own files to other electronic data files, and it interfaces to computer-aided design systems through Interactive Graphic Exchange specification files.

Catsolid costs $20,000.

Catronix, 120 Ralph McGill Blvd. N.E., Atlanta, Ga. 30308.

See TRENDS page 72

Nowadays, technology is advancing so rapidly that today's latest breakthrough may be replaced as soon as tomorrow by something even more revolutionary.

PEACE OF MIND A NEW DIMENSION.

To the rapidly-changing world of high technology, Esprit—the company with more experience in terminal technology than any other—would like to introduce a new and un-changing dimension: peace of mind.

Designed right into every terminal in Esprit's complete line are the features, the functions and the flexibility that make it not only user-friendly but systems-friendly. In other words, the kind of comfort, quality and trouble-free technology that can provide real peace of mind.

Backed up with an extensive nationwide service force and our own special toll free service number (800-645-4508)—so you can reach us about anything that concerns you—to insure your own peace of mind.

PEACE OF MIND FOR THE NEXT GENERATION IN TERMINALS.

One look at the Esprit ESP 6310 and you'll recognize the next generation of terminals. With performance and features far superior to other terminals in its price category. And the kind of quality you can feel comfortable with.

DESIGNED FOR PEACE OF MIND.

From the sleek and stylish lines of its ergonomic design to the sculptured lines of its low-profile keyboard with its 11 user-programmable function keys—shiftable to 22—in non-volatile memory back-up, that can be programmed directly or down-line loaded from the host computer.

From its high resolution, green phosphor display with a well defined character font, in a large 7 x 11 dot matrix, in an 80 column x 25 line format to its screen saver feature which deactivates the screen after 20 minutes of inactivity.

From its tilt and swivel monitor to its smooth scrolling and line graphics capabilities.

Our ESP 6310 provides enhanced performance and incorporates emulations of the TeleVideo 925/910 PLUS*, ADDS Regent 25/Viewpoint* and Lear Siegler ADM3A*, as well as the popular Esprit series.

PEACE OF MIND PRICE. $695.

That means even our low price is designed to give you peace of mind. And so for your own peace of mind, please fill out the coupon below or call.

SOFTWARE & SERVICES

TOOLS from page 71

UNIRAS, INC.
Bizmap

A software package for map making, which contains the resources of the U.S. government's World Data Bank I, has been introduced by Uniras, Inc. The package, Bizmap, can be used to preview world maps on a color terminal and, using the data bank's 250,000 coordinates, can project any of 191 countries, including major islands and lakes.

Bizmap users can choose countries, continents or the world in five projections, in two or three dimensions or from any viewpoint, the vendor said. The package is written in Ansi Fortran-77, and implementations are available for 32-bit and mainframe computers.

Bizmap is licensed for $5,000.

Uniras, Suite 212, 50 Mall Road, Burlington, Mass. 01803.

PROFESSIONAL COMPUTER RESOURCES, INC.
RMS/38 Version 4

Professional Computer Resources, Inc. has announced enhanced RMS/38 applications software for the IBM System/38.

The RMS/38 Version 4 consists of 15 applications grouped into a distribution module and a manufacturing module. Distribution module applications provide control of order processing, billing, sales analysis, inventory control, purchasing, accounts payable and receivable, general ledger and RMS/Query.

The manufacturing module applications provide control of product structure, product standard costing, master production scheduling, shop floor control and costing and capacity requirements planning.

License agreement prices for the complete RMS/38 system range from $55,000 to $110,000.

Professional Computer Resources, 2021 Midwest Road, Oak Brook, Ill. 60521.

ELSEVIER SCIENCE PUBLISHING CO.
Pac-Finder System 34/36 Software Directory

Elsevier Science Publishing Co. has announced a revised edition of its "Pac-Finder System 34/36 Software Directory" for IBM System/34 and 36 installations.

According to the publisher, Pac-Finder provides information on the vendor, price, source language, number of installations, functions, capabilities and unique features. Applications covered include accounting, payroll and personnel, office automation and manufacturing.

The single-copy price is $95; the standing-order price is $79.

Elsevier Science Publishing, 52 Vanderbilt Ave., New York, N.Y. 10017.

REMOTE COMPUTING SERVICES

SOFTEST, INC.
Sofgram

Softest, Inc. has introduced a software program that reportedly enables a user to create, receive and send messages over Western Union's Telex and TWX networks, as well as via AT&T's Direct-Distance Dialing (DDD) network.

Sofgram can use an existing Telex line or a mailbox available from a Telex or TWX International Road Carrier, a vendor spokesman said. Sofgram is a fully menu- and form-driven program, and it is said to permit access to the data base services available on Telex, TWX and DDD networks.

According to the vendor, Sofgram maintains an in box for each user on the system and keeps a summary of all messages received. All destination addresses are maintained and are accessible through a user-specified key.

Sofgram is available now for Altos Computer Systems, Inc.'s 586 series of desktop microcomputers. It is also available on Callan Data Systems, Inc. and Codata Systems Corp. microcomputers, the vendor said.

Sofgram costs $750 for a multiuser system and $500 for a single-user system.

Softest, 555 Goffle Road, Ridgewood, N.J. 07450.

MARCAM DATA SYSTEMS CORP.
Ultimics

Marcam Data Systems Corp. has announced a system designed to provide users of IBM's System/34, 36 and 38 with batch/lot tracking and multiple-location inventory control.

Unlimited Location/Lot Tracking Inventory Control System (Ultimics) is said to operate with the IBM Mapics manufacturing and production system.

It reportedly is designed to provide efficient use of warehouse space by allowing an infinite number of stocking locations per item and allowing the stocking of multiple items in one location. Its on-line transactions update Mapics and Ultimics files so inquiries and reports reflect the current status of inventories.

It also is said to provide batch/lot tracking capabilities to comply with governmental regulations, track assigned serial numbers to customer orders, handle theoretical usage (back flushing) and track government contracts and terms.

Ultimics is priced at $6,400 for the System/34, $6,900 for the System/36 and $8,900 for the System/38.

Marcam Data Systems, 19 Crawford St., Needham, Mass. 02192.

IF YOU'VE EVER OUTGROWN A FINANCIAL SYSTEM, THIS IS A SEMINAR YOU WON'T WANT TO MISS.

GL, AP, MM, PO, AND SOON ARC

The Walker "Once and for All" Seminar. If you're looking at financial applications software, you're probably planning to replace an unwieldy system. One that fails to meet your needs for information management, technological compatibility or operating efficiency. Even perhaps, all three.

Walker offers a full range of financial systems specifically designed to grow with you. Easily. Which means the Walker Seminar could be the last financial software seminar you'll ever attend.

You know the problem. Every time you have to change or add to your current system, you discover new roadblocks. Custom reports have to be programmed on top of your old system. Changes and additions have been so frequent that nobody understands just what the system can do. Or how it does it. New technology could make your business run better... but your financial system won't run on it. And you must divert valuable time and resources to find a new system. Again.

Financial software you won't outgrow. Walker introduced a revolutionary technology: Software that separates the applications (what the software does), from the database (how the system interfaces with your data center). It's a proprietary technology which continues to grow with the needs of hundreds of corporations. Worldwide. Including the 1984 Olympics.

Better management tools. Walker's "Strategic Software" allows you to modify your financial system to work the way your company works. And change as your company changes. Simply. Immediately.

Freedom. Walker financial applications packages are not dependent upon a specific technology, operating system or data base management system. By utilizing a unique "software bridge," Walker isolates the applications software from both the mainframe and the DBMS. Which means you're free to choose the technology and DBMS that's best for your company's needs. Without the need to replace or rewrite your financial system, or retrain your staff.

A free seminar. In a few short hours, you can see how integrated, interactive financial systems can save you time for years to come.

Even a free phone call. You can fill in the coupon below, or call us today, toll free: 1(800) 4 WALKER (outside California), (415) 495-8811 (within California). That way we can register you for the seminar that's most convenient for you. In realtime. Like Walker software.

COMMUNICATIONS

Service provides finance programs

NEW YORK — Regional and community banks and other financial institutions with personal computers can access a recently announced service that will enable them to tap remote data bases, perform stock transactions and call up and execute various financial management programs.

The Spectrum Information, Communications and Execution (ICX) service was introduced by the Investment Banking Group, a division of Union Planters National Bank, and Reuters, a company that provides electronic news and quotation services.

Warren G. Creighton, president of Investment Banking, said that Spectrum ICX will "allow users to originate mortgages for customers, dispose of those mortgages, transact stock purchases and sales and access asset/liability models to manage their balance sheets balance."

Uses satellite delivery system

Additionally, the service allows access to the news and quotation services provided by Reuters and uses that organization's satellite delivery system called the Small Dish Service (SDS).

Communications between Investment Banking and its ICX customers will be via the telephone system in one direction and broadcast by satellite in the other.

Customers will access the service from their IBM or Commodore Business Machines, Inc. personal computers by activating an autodial modem in an interface device provided with the service; they can then request the data desired. That information will be broadcast to a Reuter's SDS-type satellite dish antenna mounted on the customer's roof.

Excluding the cost of the personal computer and the phone line between the customer's premise and Investment Banking in Memphis, Tenn., the service will cost roughly $400 per month. Other Reuters services, like its money market and foreign exchange data service, are available for an additional monthly fee.

Investment Banking is located at Suite 427, 6077 Primacy Pkwy., Memphis, Tenn. 38119.

Net mart confusion cited

NORWALK, Conn. — Vendors of local-area networks have outsmarted themselves and have thrown much of their marketplace into confusion, according to a report released here recently.

The 215-page report, titled "Local-Area Networks: Applications, Technologies & Opportunities," from International Resource Development, Inc. (IRD), attributes the slower-than-expected growth of the local-area network market to "growing confusion" among users about which of more than two dozen different local-area network technologies to use, together with "major problems" of incompatibility between new local-area network products and existing workstations and personal computers.

The report also states that the proliferation of different local-area network techniques is also exasperating the semiconductor industry, which is "wasting millions of dollars" attempting to follow the twists and turns in local-area network standardization.

"There is more than a nagging doubt in the minds of some semiconductor executives that high-volume production will never be achieved on several of the local-area network chips currently on the market or in development," said Kenneth G. Bosomworth, IRD's president and a participant in the study effort.

Contributing to the malaise in the local-area network market are the expected local-area network products from IBM and AT&T, according to the study. IBM has developed a token-passing local-area network, demonstrating a prototype last year; the first of IBM's local-area network products will be announced later this year, the report states. AT&T recently introduced Datakit, a set of switching modules that can be used to fashion a local-area network and which have been used internally inside AT&T for some time.

Despite user hesitancy to purchase local-area networks, there is an opportunity for innovative suppliers of limited low-cost local-area networks to connect up to 20 personal computers, the report states. "There is a clearly defined segment of the personal computer market for which the low-cost local-area network provides an immediate and easily implemented set of systems solutions. This is where the market action will be this year," Bosomworth predicted. "In the longer term, however, the local-area network market will be gob-

See NET page 77

Messaging systems get HP interface

Telamon, Inc. has announced an interface product said to provide direct access between Hewlett-Packard Co. HP 3000 computers and Western Union, Inc.'s Telex, TWX, Easylink and other electronic messaging systems using dial-up telephone lines.

Easynet/3000 is a combination software and hardware product that reportedly eliminates the need for telex terminal equipment, allowing any terminal connected to the HP 3000 to act as a telex workstation.

According to the vendor, the product reduces operator delays experienced in manual telex operation, queues messages for later transmission, permits multiple workstations to use the same transmission line, provides message logging for cost allocation and traffic analysis and transmits documents already resident on the HP 3000 without retyping.

The system manages up to 32 transmission lines simultaneously, according to the vendor.

A basic configuration, priced at $5,250 and available now, supports two lines and requires one computer port per line, the vendor said.

More information is available from Telamon, located at Suite 302, 405 14th St., Oakland, Calif. 94612.

Breakup seen opening up U.S. market to Japanese

NEW YORK — The breakup of the Bell system will open the U.S. market to a flood of Japanese telecommunications equipment, according to report findings recently released here.

According to the report, "Japan, Inc. in the Telecommunications Market," published by Northern Business Information, Inc. (NBI), divestiture has fundamentally altered the nature of competition in U.S. telecommunications markets in several ways, all of which will benefit the Japanese.

The Bell breakup has breached the supply line between AT&T and the former Bell operating companies, the report claims, making the new regional holding companies potential customers of Japanese transmission and central office equipment.

The report contends that the regional holding companies have already shown that they intend to be major suppliers of subscriber switching equipment procured from Japanese firms.

Japanese-made key systems

All seven regional holding companies, plus AT&T affiliate Southern New England Telephone (Snet) are entirely dependent on Japanese-made key systems, according to the report, and five regional holding companies plus Snet will supply Japanese private branch exchanges (PBX).

NBI said that divestiture exposes AT&T's embedded base of obsolete electromechanical key systems and analog PBXs. This represents a potential new market for Japanese products worth about $20 billion.

Divestiture has changed the nature of competition in the U.S. telecommunications equipment market, according to the study. The historical relationship between AT&T and its customers has been weakened or broken entirely.

In the future, more emphasis will be placed on technological and cost considerations; this, NBI asserted, will tend to favor the Japanese relative to many of their North American and European competitors.

The initial stage of deregulation, the creation of the interconnect market, led to today's situation where, according to the researchers, Japanese companies made the largest proportion of key systems sold in the U.S. in 1983.

The final stage of deregulation, the breakup of the Bell system, will allow Japanese suppliers to expand their share of the PBX market to as much as 40% by 1988, the report contends.

For all but the smallest Japanese companies, establishing a large installed base of digital switching products is the key to penetrating the entire range of U.S. markets for electronic information technology.

The growing Japanese position in telecommunications and the demand that it will promote for other Japanese information technologies hold implications for the entire U.S. economy, according to NBI.

In 1983, the Japanese enjoyed a surplus in telecommunications trade with the U.S. of $389 million. Combined with a related surplus of $1.4 billion in electronic components and $767 million in computers, the total becomes $2.5 billion, nearly 13% of the entire $20 billion trade deficit the U.S. held with Japan in 1983, the report states.

The 174-page report is priced at $995 and is available from NBI, located at 66 W. Broadway, New York, N.Y. 10007.

CONTROLLERS

CONNECTICUT MICROCOMPUTER, INC.
Busster B64R

Connecticut Microcomputer, Inc. has added a 64-digital line output module to its Busster series of I/O modules.

The Busster B64R digital output module is a self-contained RS-232-compatible device that accepts commands from any host computer through its RS-232 port and activates one to 64 digital transistor-to-transistor-logic-level lines, the vendor said.

The module can be programmed through Basic commands from the controlling computer, the company noted.

The Busster B64R sells for $495 in standard version including case and power supply, according to a spokesman for the vendor.

Connecticut Microcomputer, 36 Del Mar Drive, Brookfield, Conn. 06804.

SYSTAR CORP.
Lodestar options

Systar Corp. has announced two new options for Lodestar, its front-end product for IBM System/34, 36, and 38.

New options include a menu selection option that enables users to call up and choose an application from a menu without having to know the relation of applications to hosts by physical location; Lodestar selects the proper host for the application.

A second feature permits assignment of hosts to specified users according to the need to access. Host assignments are set by a network operator from the Lodestar network control center, the vendor said.

A new spooler option also announced provides users universal printer access in the network without user queuing. The Lodestar spooler handles all data throughput to printers on a transparent-to-user basis, queuing automatically all output. Users may send unlimited numbers of files without waiting for printer availability, the vendor said.

COMMUNICATIONS

The spooler costs $9,500. The applications-oriented features are no-charge options to Lodestar network users.

Syster, Suite 305, 1762 Technology Drive, San Jose, Calif. 95110.

MULTIPLEXERS/ MODEMS

ENVAX SYSTEMS, INC. Envax

Envax Systems, Inc., a subsidiary of Noakes Data Communications, Inc., has added Wang Laboratories, Inc.'s personal computer to the list of equipment which can use the company's communication co-processor.

The Envax is actually a buffered modem that enables personal computer users to dump messages that are sent into the modem's memory and then go about their work using the computer while the message is being transmitted. Similarly, messages can be received and stored by the modem while the attached personal computer is being used. A light indicates that data has been received.

The device, which allows access to telex, TWX and direct-distance dialing networks, costs $1,295 with associated software, the vendor said.

Envax Systems provides similar products for the IBM Personal Computer, Xerox Corp. Xerox 820, Corona Corp. and Texas Instruments, Inc. personal computers.

Noakes Data Communications, 8320 Stowell, Irving, Texas 75061.

DYNATECH PACKET TECHNOLOGY, INC.
1603, 1604 data sets; 1605, 1606 line drivers; 1610, 1611 modem eliminators

Dynatech Packet Technology, Inc. has announced a complete line of limited distance data sets, line drivers and modem eliminators for both asynchronous and synchronous applications.

The 1603 and 1604 data set models run up to 19.2K bit/sec on normal twisted pair or transformer-coupled twisted pair and provide line surge protection. The 1605 and 1606 are switched asynchronous or synchronous line drivers that will operate from 1.2K to 19.2K bit/sec. These units will run full or half duplex. Models 1610 and 1611 modem eliminators will also run asynchronous and synchronous up to 19.2K bit/sec, the vendor said.

All units are available stand-alone and rack-mounted. Prices range from $220 to $420.

Dynatech Packet Technology, 9464-G General Green Way, Alexandria, Va. 22312.

OPTELECOM
Models 4121, 4122

Optelecom has announced two fiber-optic modems, Models 4121 and 4122, both of which provide full-duplex data transmission between asynchronous RS-232C terminals, CPU ports, modems and/or multiplexers using duplex fiber-optic cables.

Both modems handle data speeds to 100K bit/sec over optical cables one mile long. Indicator lamps display operational status of the data link and modems, the vendor said.

Both models are priced at $160.

Optelecom, 15040 Luxmanr Drive, Gaithersburg, Md. 20877.

TELEBYTE TECHNOLOGY, INC.
Model 79

Telebyte Technology, Inc. has introduced the Model 79 dual short modem, a high-density, short-haul modem package.

Continued on page 78

NET from page 73

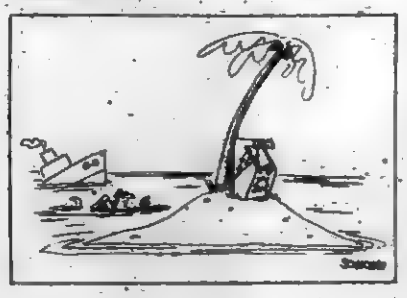
bled up by IBM derivatives and, perhaps, also by AT&T products," Bosomworth predicted.

Standards, too, are factors which are contributing to the market confusion, the report noted, although the IEEE 802 committee has made considerable progress. Currently, the Xerox Corp. Ethernet protocol is encompassed within the IEEE 802.3, and the widely used Datapoint Arcnet protocol is covered by the IEEE 802.4. Industry observers expect 802.5 to be promulgated as the new IBM protocol.

IRD expects the market for local-area networks to grow significantly from $200 million in 1984 to about $1 billion in 1988. (These figures do not include the workstations, personal computers and file servers that are attached to the local-area network and which collectively account for a much higher value of shipments than the local-area network components.)

IRD's Bosomworth expects that specialized suppliers of local-area network components and systems will be facing an increasingly uncertain future as more of the functionality of the local-area network is placed on chips and integrated directly onto printed-circuit boards within workstations and desktop computers.

The report is priced at $1,650 and is available from IRD, which is located at 30 High St., Norwalk, Conn. 06851.



TIME is MONEY

OEM 200 doesn't waste either.

You can't afford to waste time waiting for your printer to finish before your computer can move on to something else. The OEM 200 is designed for THRUPUT. The large print buffers, high speed space skip and fast paper advance combine to generate 'usable' speed, not simply impressive spec sheet figures!

With the OEM 200's unusually large buffers, you can print and process simultaneously.

NO WAITING.

Most printers have very small buffers - 2K or 4K at most. Our 150 CPS wide carriage OEM 200 comes standard with a 4K buffer which is expandable to 20K, 36K, or 68K. MPI offers the biggest buffers in the business!

The OEM 200 has other outstanding features like an optional SoftSwitch™ front panel keypad and a fast and impressive near letter quality mode. Our exclusive applications packages (AP-PAKS), providing enhanced graphics printing along with a vast selection of decorative type styles, are available for selected microcomputers.

At a suggested list price of $1045, the OEM 200 won't take your life's savings either. STOP WASTING TIME AND MONEY. BUY AN OEM 200 FROM MPI — The American Printer Company!

Call Us For More Information At: (800) 821-6848

Model shown with optional SoftSwitch™ keypad.

Continued from page 77

The modem provides full-duplex operation at speeds up to 19.2K bit/sec at distances up to 10 miles over two twisted pairs, according to the vendor.

The operating status of the modems is reported to the user via four front-panel-mounted LEDs, which display the activity on the transmit, receive, data terminal ready and data carrier detect lines.

Each of the modem channels is equipped with a data terminal equipment/data carrier equipment switch and a loopback switch, according to the vendor.

All I/O connections to the modems are routed via a 30-pin, card-edge connector. The price is $225.

Telebyte Technology, 148 New York Ave., Hauppauge, N.Y. 11788.

AUXILIARY EQUIPMENT

ACCENTEL CORP.
Worldfone

Accentel Corp. has introduced the Worldfone, a teleprinter terminal that is compatible with Western Union's Telex and TWX services as well as the telephone network.

The Worldfone is said to weigh less than 33 lb. It has an 80-char., 25-line amber monitor; two 180K-byte, 5¼-in., double-density disk drives; 64K bytes of internal memory; an internal 300 bit/sec modem; an RS-232 interface; an 80 char./sec printer; and a detachable keyboard with a numeric pad, the vendor said.

Reportedly, messages created on the screen can be printed or transmitted by pushing a single button.

With an internal clocking mechanism and an autoanswer feature, an unattended Worldfone can send and receive messages, according to the vendor. The device can store up to 150 messages, which are dated and time-coded as received. A list of stored messages can be printed out.

The vendor said that the device has text editing capabilities and can run Digital Research, Inc. CP/M applications. It costs $2,995.

Accentel, 1708 Shoreline Road, Mountain View, Calif. 94043.

ANALYTICS COMMUNICATIONS SYSTEMS
Fimac

Analytics Communications Systems has added the Fimac security device to its Sherlock line of information security modules.

The product is available both as an in-circuit device and as a peripheral for intelligent terminals. There are two models: the HM-241 for peripheral attachment and the HM-244 for in-circuit placement. Both models provide an RS-232 port for connection to a data terminal; the HM-244 has a second RS-232 port for connection to communications equipment.

Available now for asynchronous and bisynchronous communication, both models are priced at $1,995.

Analytics Communications Systems, 1830 Michael Faraday Drive, Reston, Va. 22090.

DATAFLOW SYSTEMS, INC.
Tel/3000

Dataflow Systems, Inc. has announced the Tel/3000, a product which offers Hewlett-Packard Co.'s HP 3000 minicomputer users an interface to portable data entry terminals.

The portable data entry terminals are hand-held microcomputers capable of supporting an acoustic coupler or an RS-232 interface. This allows the portable terminal user to transmit data to the system, where the Tel/3000 is waiting to receive the data, check for possible error conditions and write the data to disks, the vendor said.

Some of the product's features include multiple-line processing capability, batch or message file output to disk, parity checking, error substituting, error counting, error tolerance-limit checking and automatic shutdown. It returns a steady tone to its user on acceptable transmission, and a warbled tone on rejected transmission, according to a company spokesman. The price is $3,500.

Dataflow Systems, 5302 E. Victory Drive, Indianapolis, Ind. 46203.

CLYDE DIGITAL SYSTEMS, INC.
Calout

Clyde Digital Systems, Inc. has announced the availability of Calout, a communications product that reportedly allows a user to call up any other computer from a Digital Equipment Corp. RSX-11-based host system and act as a remote user with complete file transfer capabilities.

The product enables users to transfer all types of disk files, including binary program files, using optional remote modules.

Calout is priced at $1,500.

Clyde Digital Systems, 3707 N. Canyon Road, 3-E, Provo, Utah 84604.

NATIONAL APPLIED COMPUTER TECHNOLOGIES
LCX 120A

National Applied Computer Technologies has announced the LCX 120A turnkey system, designed for use by communications service resellers.

Features include: least-cost routing based on calling privilege and dynamic cost table; customer data base management with multiple-key access; Federal Communications Commission-approved telephone switching equipment; multitasking; and multiprocessing.

A 120-port system costs $67,500.

National Applied Computer Technologies, 744 S. 400 East, P.O. Box 1870, Orem, Utah 84058.

UNIX & C

HANDS-ON TRAINING

Select your training medium according to the type of training you prefer and the number of people to be trained.

VIDEO-BASED TRAINING. The Computer Technology Group's Video-Based Training integrates professionally developed and produced video and text material, as well as hands-on exercises, into complete training programs.

Our courses are produced with the highest standards of video quality, applying the latest techniques of instructional design including the use of computer graphics and animation techniques to compress learning time. The students' time is not wasted with the "camera at the back of the classroom" or "chalk talk" approach which is so inefficient, and often ineffective, in transferring skills.

Our Video-Based Training courses are completely self-contained, including the hardware-independent hands-on exercises. All you need is a video cassette player.

COURSE	Number of Modules: Video-Based	Interactive
Computers at Work	15	
UNIX—An Executive Perspective	1	
UNIX Overview	6	6
UNIX Fundamentals	15	15
"C" Language Programming	16	16

INTERACTIVE VIDEODISC TRAINING. Our new UNIX Videodisc Training Curriculum combines the benefits of our Video-Based Training with the flexibility of microcomputer access. Designed as a one-on-one tutor, our interactive system assesses the training needs of each student and dynamically tailors the training to his/her specific needs, thus eliminating redundant training. Through engaging exercises and interactive video, we are able to increase student comprehension while reducing training time.

Developed by the Computer Technology Group and Interactive Training Systems, the curriculum uses the latest laser videodisc technology—including IBM PC, color monitor and Interactive Training System Controller.

PUBLIC AND IN-HOUSE SEMINARS. Both public and in-house seminars are offered on a wide variety of UNIX and "C" Language subjects, including:

UNIX Overview • UNIX Fundamentals for Non-Programmers • UNIX Fundamentals for Programmers • Shell as a Command Language • "C" Language Programming • Shell Programming • Using Advanced UNIX Commands • UNIX Internals • UNIX Administration • Advanced "C" Programming Workshop • Advanced "C" Programming Under UNIX • Berkeley UNIX Fundamentals and "csh" Shell.

COMPUTER TECHNOLOGY GROUP
Technocrafts, Inc.

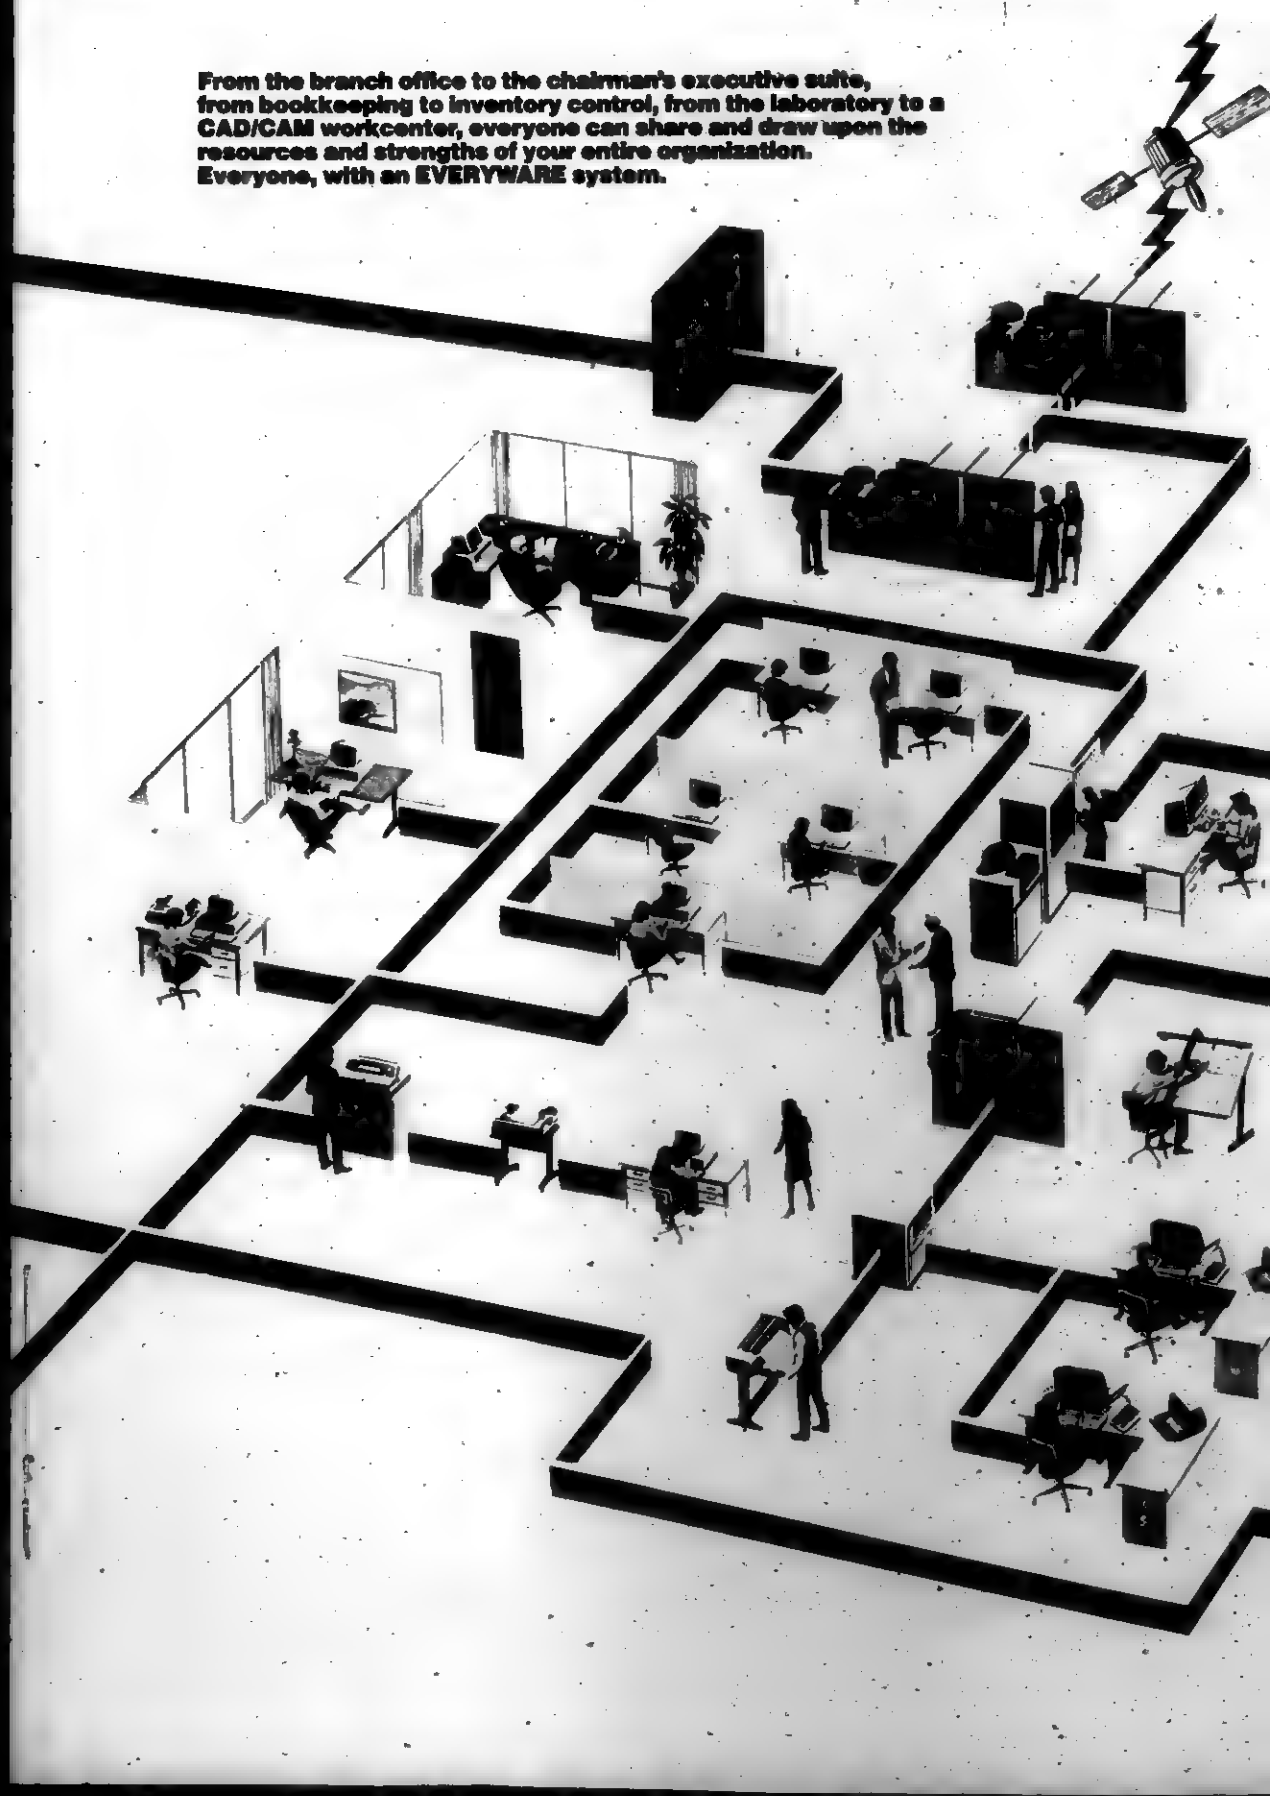
UNIX is a Trademark of Bell Laboratories

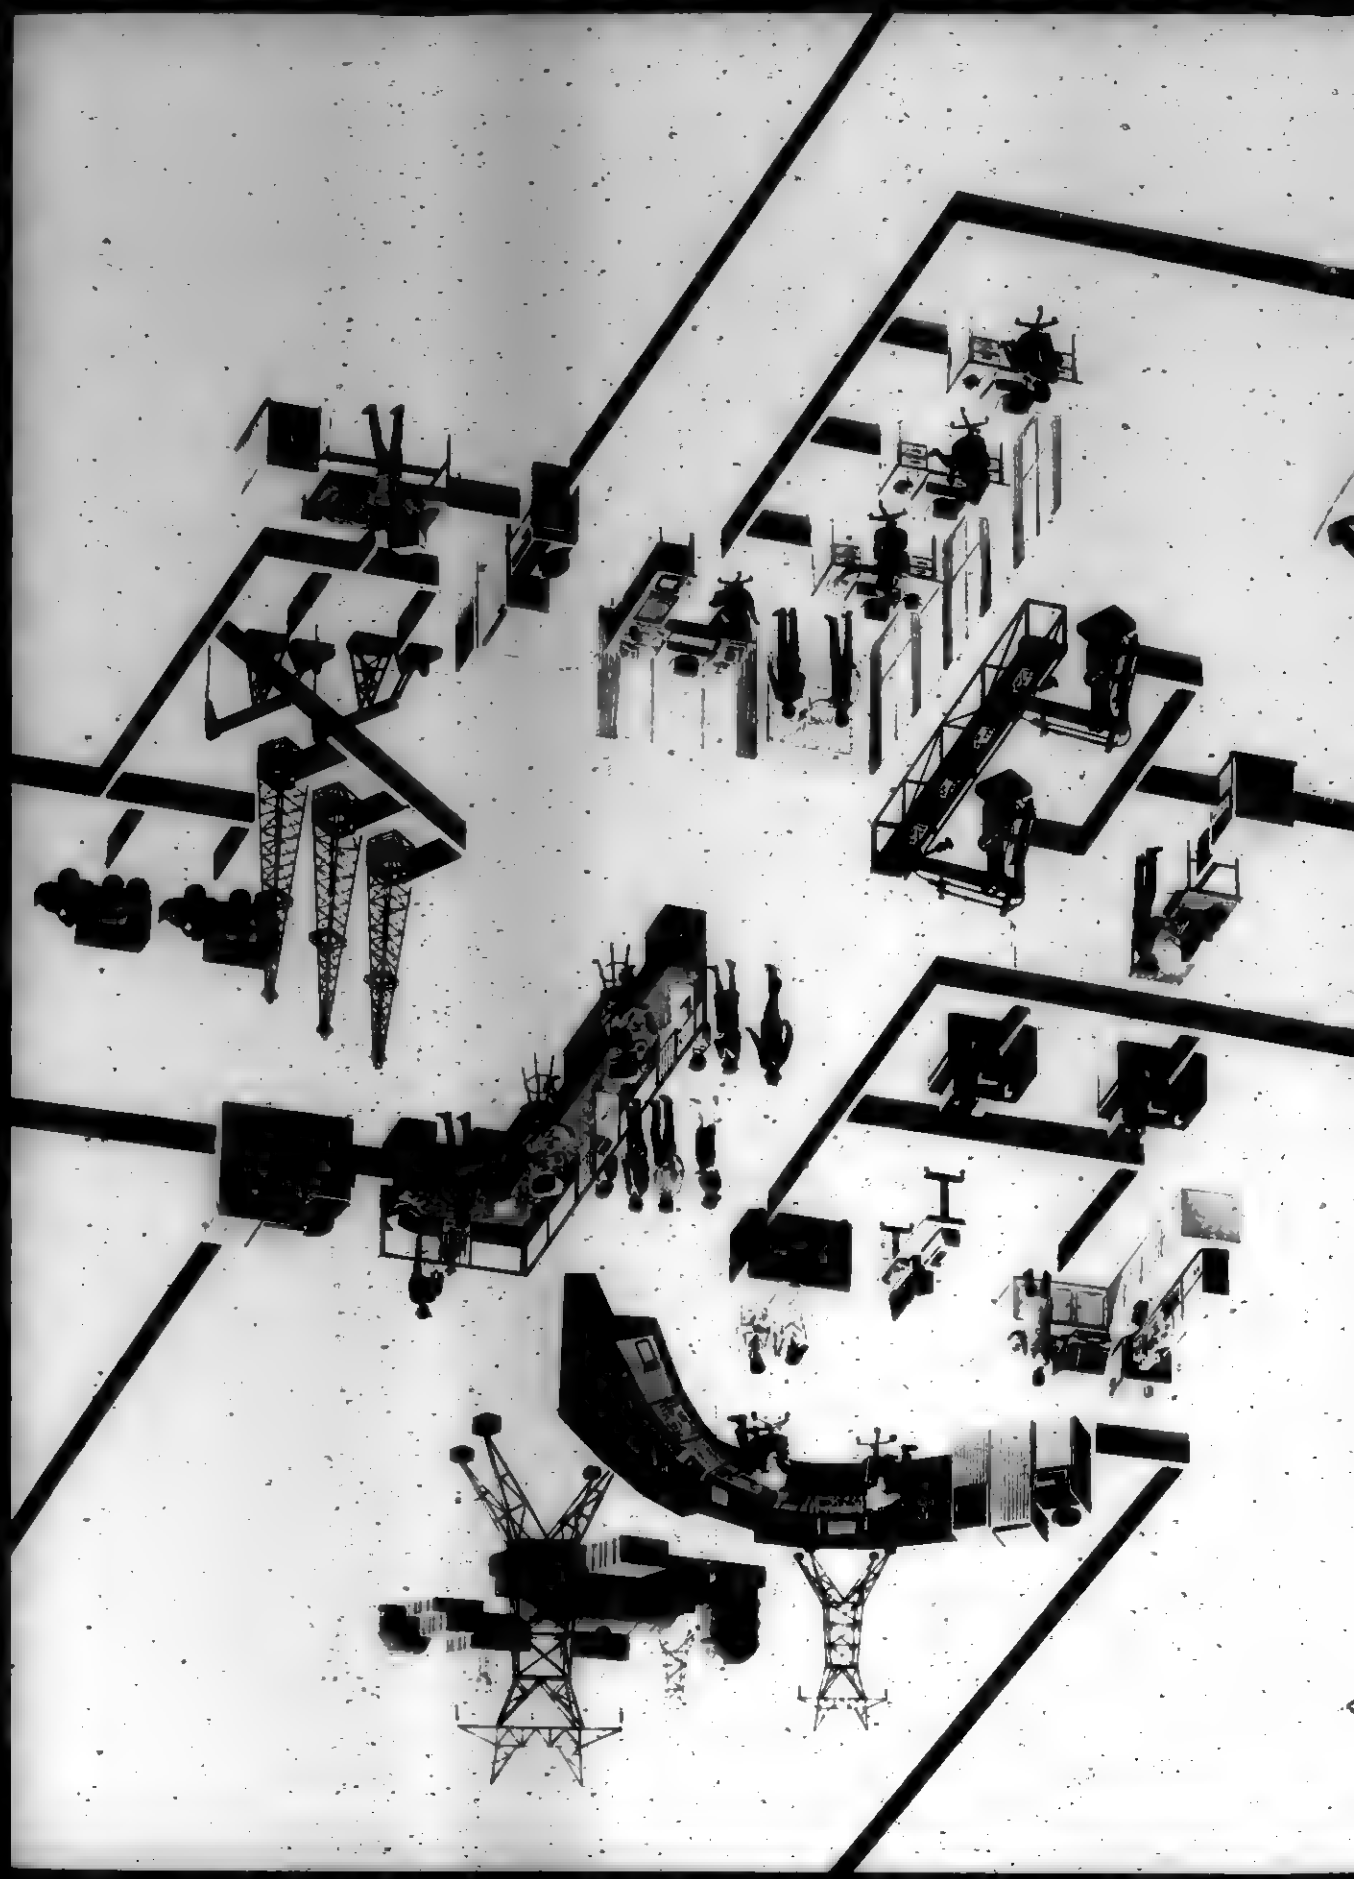
Where can you find the solutions to your compatibility, connectivity, portability, and expansion problems?

EVERYWARE™

from Perkin-Elmer.

From the branch office to the chairman's executive suite, from bookkeeping to inventory control, from the laboratory to a CAD/CAM workcenter, everyone can share and draw upon the resources and strengths of your entire organization. Everyone, with an EVERYWARE system.





EVERYWARE™ products from Perkin-Elmer.

Everything you need for the systems you want.

EVERYWARE hardware: a comprehensive selection.

Our computers range from the Series 3200 superminis—including the economical 3205 and the incredibly fast and powerful 3250XP—to the Series 7000 desktop professional computers, built around the powerful M68000 microprocessor. Since EVERYWARE hardware is based on a distributed processing architecture, it lets you bring the right amount of computing power right where you need it.

EVERYWARE software: unparalleled flexibility.

Since software is your biggest long-term investment, we set out to protect it with several key features. First, we offer a common operating system that spans our entire line of products. Derived from a UNIX* operating system, this common operating system offers programming productivity advantages. And, all our computers speak the same languages, FORTRAN and C. These languages are bridging tools that link this common operating system and our proprietary OS/32 operating system to give you both developmental advantages and real-time capability.

EVERYWARE software is more than operating systems and languages. It includes Reliance PLUS, a proven relational DBMS that shows how user-friendly a powerful transaction processing system can be. And there is the Resilient System, which links dual Series 3200 computers for high availability processing.

Finally, our operating systems allow you access to the huge library of existing third party software. For example, you can run a word processing package like VisiWord,™ or a spreadsheet like Supercomp-Twenty,™ and many other popular applications packages.

EVERYWARE communications: a commitment to standards.

EVERYWARE systems can share information with IBM environments via SNA or BSC using emulators for such products as IBM 3270, 3770, HASP and 2780/3780. You can form a local network or join one using Ethernet. And through Perkin-Elmer's PENnet-Plus you can use all the global facilities of the CCITT X.25/X.29 Packet Switching Network. EVERYWARE products conform to the ISO-OSI Reference Model, assuring long-term connectivity.

Perkin-Elmer introduces EVERYWARE™

At last, a comprehensive application of the world's major hardware, software and communications standards. For your present and next-generation information systems.

You've devoted a lot of time and money developing software programs to meet the needs of your organization. What happens when it's time to upgrade your hardware? Will your software make the transition smoothly? Especially now when the cost of writing and maintaining software continues to climb. How do you protect your existing investment and make all the right moves for the future?

The heart of the problem is the lack of universally applied hardware, software and communications standards. Now Perkin-Elmer has done something about it. Our EVERYWARE product family offers you proven, established and widely supported industry standards. You can live with them now. And tomorrow.

The compatibility and connectivity problem. The Perkin-Elmer solution: EVERYWARE products.

You face the challenge of developing new systems and software every day. Frequently, these systems have to become part of your existing processing environment. EVERYWARE products offer the ability to coexist with systems from other manufacturers. This has been achieved in three ways. First, by Perkin-Elmer's commitment to an industry standard operating system. Second, through our commitment to compatible languages. And finally, by our support of all of today's and tomorrow's major communications protocols. As a result, EVERYWARE computers can share information with other systems desk-to-desk, room-to-room, across town and across continents.

The portability problem. The Perkin-Elmer solution: EVERYWARE products.

The capability to efficiently port your software is another benefit of EVERYWARE products. From computer to computer, department to department, your programs retain their value, protecting your investment. You can develop software on an EVERYWARE computer in one system and port it to other EVERYWARE computers anywhere in your organization. For example, you can write software on a desktop microcomputer and run it on a supermini. And because EVERYWARE hardware supports an industry standard operating system, you have access to a vast library of third party software.

The expansion problem. The Perkin-Elmer solution: EVERYWARE products.

Perkin-Elmer offers one of the broadest ranges of computers in the world. It extends from 32-bit superminis to desktop workstations. So you can expand at your own speed, adding the power you need, whenever you need it. As more capacity is required, you simply connect additional processors. You can grow board-by-board, or by adding complete computer systems. Because of the built-in compatibility, there is no need to re-write your applications software. Existing programs continue to run without major alteration.

EVERYWARE™ systems

EVERYWARE systems. In finance and insurance.

Today a major nationwide financial network uses Perkin-Elmer computers to flash over 500,000 updates a day to over 11,000 terminals.

EVERYWARE systems. In flight simulation.

Perhaps the most graphic demonstration of Perkin-Elmer computer strength and real-time capability is in the re-creation of flight conditions for the training of pilots and astronauts in the United States and around the world.

EVERYWARE systems. In science.

Perkin-Elmer is the acknowledged leader in the computerization of the lab. We provide the same leadership in computers for seismic exploration and many other fields of science and research.

EVERYWARE systems. Everything you need from one respected source.

Perkin-Elmer is a major manufacturer of advanced computers. Our 32-bit supermini was the first of its kind and our supermini family is the broadest in the business. Computers from Perkin-Elmer are particularly sought after for use in demanding, high-availability environments.

EVERYWARE software provides the flexibility to develop, port or purchase programming.

EVERYWARE communications products comprise the most comprehensive collection of protocols available from a single vendor.

These are decided advantages for those of you already using Perkin-Elmer computers. And exciting considerations for those now planning the evolution of information processing centers.

IN DEPTH

ILLUSTRATION BY RICHARD TIBBITT.

When and how to modify packages

By Jerrold M. Grochow

An organization looking to replace an existing system or install one in a completely new area has three options: Develop a system from scratch to its exact specifications; buy a package and use it as is; or buy a package and modify it.

In the first case, the organization can look forward to a long and costly implementation cycle with a relatively high risk of delay, overrun or inadequate definition of the system's functions leading to poor user acceptance.

In the second case, the users may find their cost saving eroded as they change procedures and policies to adapt to the peculiarities of the package. More important, it may reintroduce the risk of a long implementation period and possible dissatisfaction with the resulting product.

The third case, buying a package and then modifying it, would seem to combine either the best or the worst possibilities of the first two. If we can figure out how to combine the best characteristics of custom development and software package purchase, then we will have developed a new alternative with some exciting possibilities.

While there are any number of specific reasons a package may be found lacking, almost all can be categorized into the areas discussed below. (Some problems may have to do with the vendor itself rather than the product, which is yet another category.)

Perhaps the most obvious area for change has

In the ideal software world, packages would be designed and developed for users to tailor to their individual needs. The result would be software with the best characteristics of package purchase and custom in-house development. In the less-than-ideal world, users can still find a suitable compromise solution.

to do with reports. While most package systems come with a number of standard reports, it is highly likely that an organization will want to make changes, at least of a cosmetic nature, on many of them.

In addition, there may be a wide variety of additional reports that are necessary, either to duplicate those that come from existing systems or to make better use of new information that will be available from the system.

Potential users may be unhappy with how particular input screens are formatted. Again, proposed changes may be cosmetic — for example, changing a label from "organization code" to "responsibility center" — or more substantive in nature.

The content of the input screen may also vary depending on whether other functional changes are to be made.

Two types of change

When we start talking about the functionality of the system, there are two types of changes that must be considered. The first occurs when there is a new feature that is desired (either because existing systems have it or because its absence has been determined to be a serious fault), in which case the modification includes figuring out how to add it to the package.

Depending on the internal technical architecture of the package and the specific modification, this effort can range from a relatively straightforward task (perhaps resulting in a totally separate program) to one that involves a significant rewrite of major portions of the system.

A somewhat easier functional modification involves changing the way the package currently performs in a particular area. For example, an accounts payable package will probably allow for automatically releasing invoices for payment but may have only limited criteria for doing so. A modification, such as one to expand invoice releasing capabilities, requires a thorough knowledge of how the package feature was developed but often proves to be a simpler modification than one for which the package has no capability at all.

Finally, modifications may be made to a package to achieve integration with other systems already in operation. While it is usually simple to interface a package with existing systems by taking a file from one and passing it to the other, true integration, while much more elusive, produces greater benefits when attained.

For example, if a new accounts receivable package can be made to use the same chart of accounts table (for editing and validation purposes) as the existing general ledger system, then you can remove the need to maintain this table in two separate systems and also ensure a much higher degree of consistency in the data accepted by your applications. Unfortunately, complete integration can almost never be achieved without significant rewriting of either the existing application or the package system.

While it is usually simple to interface a package with existing systems by taking a file from one and passing it to the other, true integration, though much more elusive, produces greater benefits when attained.

The number of modifications desired and the category that describes them will, in large measure, determine the practicality of modifying the package for your application. Before you can make a decision as to whether modifying should be done (or whether the systems design team has to choose another alternative completely), consider how these modifications would be achieved, in terms of technical architecture, the tools to assist in the work and the division of responsibilities.

How to modify a package

When people talk about modifying a package, they may be discussing any of several different processes. Some people may write additional programs to front-end or back-end the package (in other words, they have not actually changed the package itself), while others may change the externalities, such as screens and reports, while still others may modify processing programs.

Figure 1 defines the software package environment to include interfaces with other systems and any front-end or back-end programs that may be written. This "interfaced package" environment represents the majority of what people are doing with packages today. It is the baseline from which to talk about how to modify a package.

Figure 2 highlights the different parts of the package that can be modified — for example, screens, reports, programs and data bases. For most packages, modifying the reports is relatively simple and involves the use of a report writer supplied with the system. Some of the more modern packages also provide screen generators to simplify the process of reformatting and modifying input screen fields.

Modifying programs can range from very simple tasks to one that almost involves rewriting. This effort is not just a function of the type of modifications to be developed but also of whether the package vendor thought about such possibilities

8 Good Reasons to Attend the James Martin Seminar

1. James Martin has been writing THE BOOK on the Computer Industry for over 3 decades.
2. He is the most sought after consultant in the Computer Industry.
3. His predictions and recognition of major computer developments are unsurpassed.
4. With over 31 top-selling books, Martin is the industry's #1 selling author of all time. His book, *Application Development without Programmers*, is the Computer Industry's #1 selling book of all time.
5. James Martin has the unchallenged reputation as the world's finest lecturer in his field. Over 20,000 individuals worldwide have attended the James Martin Seminars. Many return year after year.
6. James Martin "... can lay fair claim to being the most influential DP guru of all time." – *ICP Interface*
7. A fast-moving, high-density, interactive 5-day program packed with information for all DP designers, management, and staff. Quite honestly, the James Martin Seminar is the industry's best educational value for the money.
   - Attend the seminar designed to dramatically increase your DP capability.
   - A major increase in productivity is attainable through the methods taught in this seminar.
   - **5 days with James Martin will dramatically alter your approach to DP.**

Many DP organizations are beginning to break the cycle of low productivity, poor responsiveness, and high application backlog of traditional DP. Now is the time for you to act. Attend the James Martin Seminar this spring. Learn the new technologies and their application to your organization. You'll discover why James Martin is ...

8. ... The Man the DP Experts Listen To!

Check the appropriate box on the coupon for more information on James Martin's 1-Day Seminar, THE END USER REVOLUTION for executives and professionals everywhere who ought to be using computers more effectively. This 1-day seminar will be held on the first day of the 5-day seminar.

Call (213) 394-8305 or mail the coupon today for a detailed brochure.

ANNOUNCING THE WY-50.

PRETTY BABY

A NEW GENERATION OF LOW-COST TERMINALS FROM WYSE

Never before has anyone put so much into something so good looking. Or so compact. It took revolutionary design to do it. Design a lot of people couldn't accomplish for the price. But we did.

In fact, the birth of the WY-50 introduces a new standard for low cost terminals. It was conceived to give you 30% more viewing area. Developed to meet the most advanced European ergonomic standards. And best of all, delivered for a surprisingly low price.

The WY-50 sells for only $695.00.

BORN WITH ADVANCED FEATURES:

- **14" screen.**
- **80/132 column format.**
- **Soft-set up mode.**
- **High resolution characters.**
- **Low-profile keyboard.**
- **Industry compatible.**
- **Only $695.00.**

For more information on the revolutionary design, outstanding features and unique good looks of our Pretty Baby, contact WYSE TECHNOLOGY and we'll send you a brochure filled with everything you need to know.

The WY-50. It's a real beauty.

WYSE

Make the Wyse Decision.

Four-Phase is helping more than 2,000 DP managers win the productivity game.

Now it's your turn.

It's easy to win the distributed information processing game when you play it with the Series 4000 from Four-Phase. The Series 4000 is an integrated, growth-oriented system designed to communicate within your IBM environment. No other vendor gives you so many functions for so many years at such affordable prices. In the distributed processing arena, that's the way to score points with both end-users and top management.

You win the DDP game with software.

Four-Phase provides one of the most impressive and complete collections of software ever offered from one company. Our packages make integrating Four-Phase computers remarkably easy. And guarantee a logical growth path for years to come. Here's just a sample of what we provide:

Interactive processing: VISION®—For creating custom applications from order entry to transaction processing. It provides a high level of functionality that can be used in any distributed environment. And VISION is easier and faster to program than COBOL.

Word processing: FOREWORD®—Our powerful shared-logic word processing system allows text to be entered, stored, edited, distributed and printed.

Graphics—For business graphics, the Graphics Management System (GMS/IV) gives you an easy way to condense and conceptually present data that's easily understood by decision makers.

COBOL—Industry standard COBOL is used to write programs for handling keyboard-entered data and general batch processing.

When they want PC's you've got them!

If your end-users are like most these days, they're clamoring for their own personal computers. We play that game, too. Because at the flick of a switch, our multifunction terminals suddenly become stand-alone PC's. So now you can give your users the distributed processing capabilities they need, AND the personal computers they want. All in one integrated system.

The action starts with the Multifunction Executive.

The key to the Series 4000 game plan is the Four-Phase Multifunction Executive (MFE). This unique and powerful control program monitors each multifunction terminal in your system. Its ability to run multiple software programs allows your users to perform 16 different tasks from any terminal on the system. And each of your users can access all of our software packages with one keystroke. You get maximum distributed processing capability and control.

Plus, MFE dynamically allocates selected peripherals so that each device can be used by more than one program. The result—MFE eliminates the need for multiple processors, duplicate terminals and other peripheral devices at installations that require concurrent execution of software.

2,000 winners and counting.

Four-Phase was the first company to introduce the integrated approach to multifunction distributed processing. Today, there are more than 15,000 installed Series 4000 systems, helping people like you manage the information needs of over 150,000 end-users. And every machine is backed by our Customer Support Operation and over 1,000 field service people to provide continuing support and reliability at every level.

Four-Phase customers have been winning the DDP game for years. You can, too. To find out how, call us today at 1-800-529-6050, ext. 1599. In Arizona, call 1-800-352-0458, ext. 1599. For a free poster of this illustration, write to us at 10700 North De Anza Blvd., M/S 52-6A9, Dept. P., Cupertino, CA 95014.

Four-Phase Systems
The Office Automation Company

when the system was initially designed. It is a lot easier to modify a program that was designed to be modified by others than one that was primarily designed to be maintained by the original developer (or at least internal to the developing organization).

Some vendors provide program generators or program templates to assist in this modification process. Furthermore, the package vendor's attitude will also influence the amount of system support and documentation that it has available, which also influences your ability to modify the package programs.

In some cases, what may appear to be a modification to the package can actually be handled by separate programs "bolted on" to the application (attached as subroutines at appropriate user exit points). Taking this approach also has some positive implications for ongoing maintenance and the ability to incorporate new vendor features into the overall system.

Once every seven to 10 years the vendor reimplements his entire system (just as you are doing). You may find you are forced to redo your systems at that time. Knowing where the vendor is in his own development cycle, therefore, is of great importance to the software package purchaser.

Modifications may also require that additional data be stored in the package data base. Again, it is hard to make general statements about the ease or difficulty of accomplishing these modifications. For some packages, vendors provide tools to allow the addition of fields (although it will be necessary to make similar additions to screens and reports). For others, the data base structure may be so ingrained in the programs of the system that even adding a single field becomes a major effort. Again, if ways can be found to "bolt on" additions to the data base, you are more likely to maintain a degree of compatibility with new functions and features that the vendor will add in the future.

With a modified package and with the addition of front ends, back ends and other system interfaces, we have an architecture that may be more common in the future and will provide many organizations with highly cost-effective solutions to the development of new large applications.

Who does the work?

Whenever systems are to be developed, there is a natural assumption that the in-house data processing department will be providing the resources to accomplish the work. Occasionally, an in-house data processing department will make use of contract programmers or system development consulting firms to augment staff or provide particular expertise. When packages are to be modified, this use of outside help, particularly from the package vendor, takes on increased importance.

With today's typical application software package running in the hundreds of thousands of lines of code, the user who finds himself in the position of trying to modify the actual program code may be well advised to seek assistance from the vendor. Unfortunately, many vendors are not staffed to provide this kind of assistance and, in fact, avoid situations where they will be called upon to provide this consulting. Luckily, there are a few vendors who not only provide this additional service but actually believe it to be an important aspect of improving the usefulness of their products.

If your package evaluation process determines that programs must be modified, you would be well advised to seek a vendor who has this capability. In fact, if the vendor is unwilling to assist in modifying the package, it may be a signal of other problems to come in the future vendor-client relationship.

Package vendors seem to fall into two classes regarding modifications. In the first case, the vendor is, in a sense, in the "mail-order software" business and only concerned with the software sale. Unfortunately, while many vendors in this category sell very good products, they are often not particularly concerned with the ultimate use of those products in the companies that buy them.

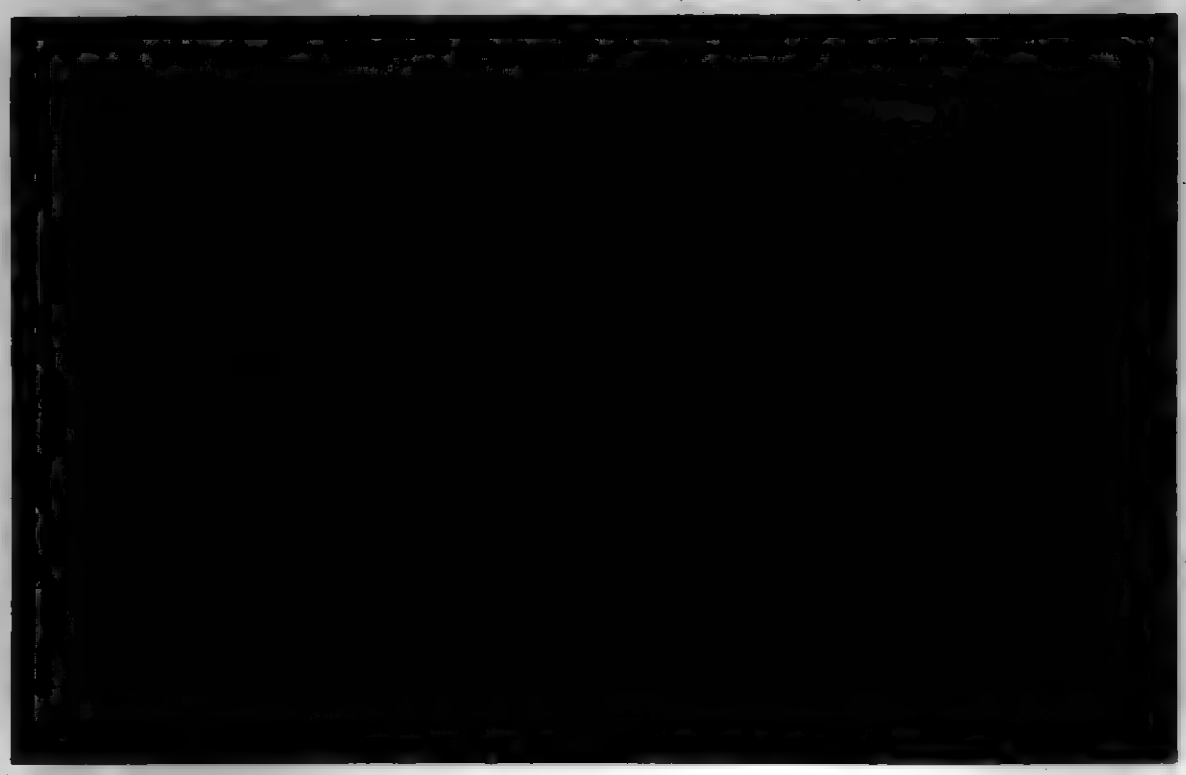
In the second camp are vendors who see the ultimate use and satisfaction of their clients as their long-term goal. They realize that add-ons and modifications are an integral part of the package implementation process — at least among the larger organizations with whom they work.

Other considerations

Other things to consider before purchasing a package with the idea of modifying it include warranty, customer support and ongoing vendor maintenance. In some cases, you may find yourself out in the cold regarding these vendor services if you touch even one field on one report. In other cases, vendors are more lenient in their policies, and these policies should be thoroughly investigated.

Vendor contracts often include a clause stating that if the package is modified, then the user is not eligible for ongoing maintenance or continuing warranty of the software. This restriction is particularly important,

Combining Boeing's distributed services with IBM's PCs could revolutionize your financial planning.



We know.

Introducing a totally new program from Boeing Computer Services. Designed to help you take maximum advantage of IBM's technology in microcomputers. While ensuring you get the same reliable, high quality computing solutions that are synonymous with the name BOEING.

For financial planners, Boeing offers the EIS® Micro Workstation — a distributed extension of the well-known EIS Decision Support System. EIS software gives business managers the information they need. Faster. More accurately. Without complicated computer programming. And now delivered economically to your desktop, via the IBM PC/PCXT.

The EIS Micro Workstation lets you download, manipulate and upload data to our MAINSTREAM® remote computing network. It gives you extensive graphics capability. What's more, with MAINSTREAM power, you gain access to the many economic and financial data banks you need for up-to-the-minute modeling. And through our Value Added Dealer (VAD) relationship with IBM, Boeing can be your single, reliable source for host processing, PC/PCXT hardware, software, maintenance, consulting, and training.

You save valuable financial planning dollars while gaining greater control over your planning and business management.

The EIS Micro Workstation is just one more unique service from Boeing, a leader in software and computing solutions. Give your decisions more support. Call 800-447-4700. Or write Boeing Computer Services, M.S. CV-26-9A, 7980 Gallows Court, Vienna, VA 22180.

BOEING COMPUTER SERVICES A Division of The Boeing Company

Boeing is an authorized Value Added Dealer for the IBM Personal Computer and Personal Computer XT.

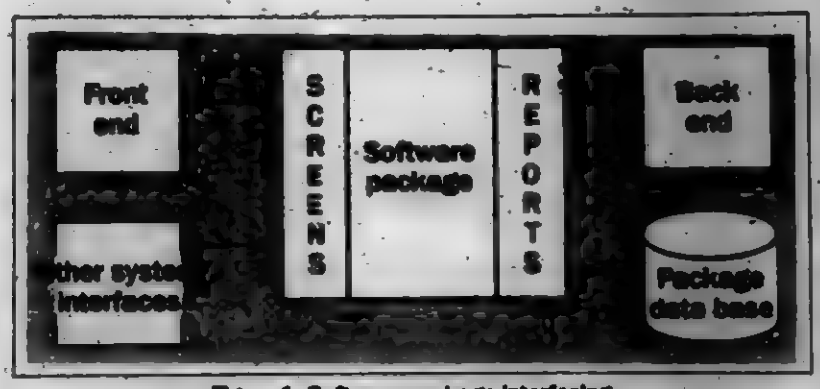

Figure 1. Software package interfacing

Figure 2. Software package modification

since one reason for buying a package is to reap the benefits of the vendor's long-term service and development program. Sometimes it is possible to modify these clauses or work with the vendor to soften them.

Assuming that this hurdle can be overcome, the next question is the impact of modifications on your ability to incorporate new releases of the software package into your operation. Not only is this capability desirable for making use of whatever new features the vendor may provide, but it may also be necessary to ensure the validity of your ongoing warranty, since most vendors require you to be on the current version within six to 12 months of its release.

In the simplest case, that of adding additional programs either through user exits or as front ends or back ends or modifying reports, you will generally not have any problem. If you go further in terms of modifying the data base or modifying programs, then you may find the need to "reapply" your modifications when the vendor's new release arrives. This job may be complicated if the new release is a significant change from the old one or if the areas of code that you modified are no longer distinguishable.

Remember also that once every seven to 10 years the vendor is going to reimplement his entire system (just as you are doing to yours). You may find you are forced to redo your systems at that time. Knowing where the vendor is in his own development cycle, therefore, is something of great importance to the software package purchaser.

Now that we have discussed the various possibilities and pitfalls of modifying a package, we are still faced with the question of how to decide whether this course is right for you. The decision will be easier if you answer the following questions during your evaluation process:

- Is the package basically sound enough to serve as the core for your systems, even without modifications?
- What is the vendor's attitude toward providing general customer assistance once you have modified the package?
- Is the system written in a computer language known to your staff so that the modifications can be maintained over a period of time?
- Does the vendor have a consulting staff who can work with you or advise you in your modifications?
- Will the vendor provide continuing warranty and maintenance support if you modify the package the way you planned?
- Does the vendor provide modification tools (screen generators, report generators, program templates or generators) to assist in this process?
- Will the vendor assist you in estimating the development time and cost of the modifications?

If you can answer these various questions positively, you may find that the modified package will save you significant time and effort. Although the modified package is a relatively new idea in the systems development business, it is not unusual to see time savings of one year and cost savings in the hundreds of thousands of dollars over in-house development. And, of course, you will continue to reap the saving over many years as the vendor provides enhanced capabilities.

In the ideal world, software packages would be designed and developed with the idea that users would then tailor them to their needs. They would serve as an effective core for what is essentially a customized system and thus provide an environment with all of the best characteristics of custom in-house development and all the best characteristics of a software package purchase.

While none of us live in this ideal world, it is possible, with sufficient perseverance and analysis, to find a happy compromise with what will be the most cost-effective solution to system development that we will see for many years.

About the author

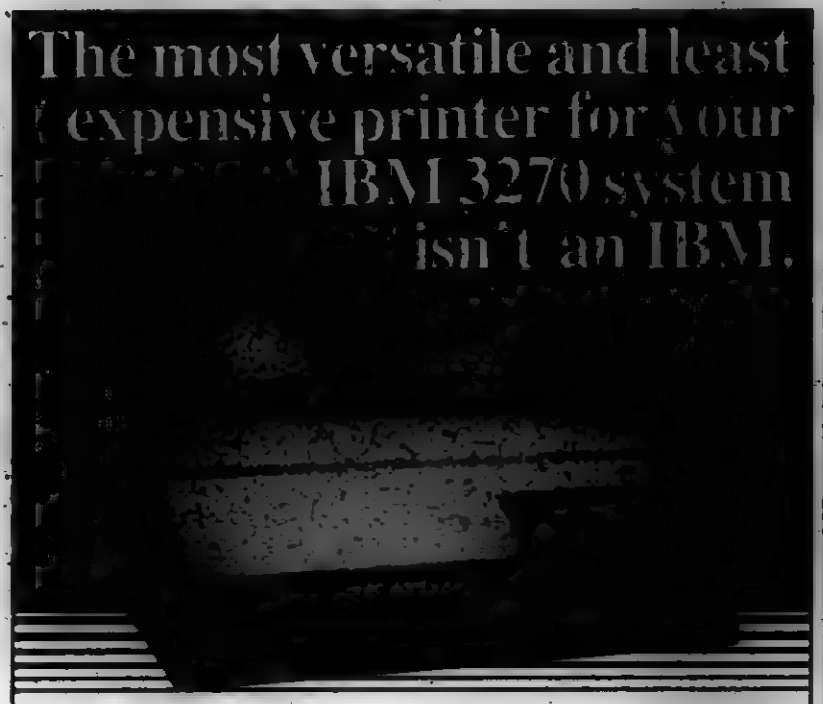
American Management Systems is the developer of the Corporate Financial System, the Generation Five Foundation Software tools and other software packages. The company provides consulting and systems development services.

The most versatile and least expensive printer for your IBM 3270 system isn't an IBM.



It's the ISI 487 that's cutting the cost of IBM on-line printing, delivering features that IBM can't match, and making a lot of people very happy. This plug-compatible, fully integrated (no box!) replacement for the IBM 3287 carries a price tag as low as $3,350 and offers you:

- outstandingly quiet operation
- 200 CPS dot matrix and 50 CPS NLQ printing
- continuous forms and cut sheet handling
- full SDLC/SCS support

For more information about the ISI 487 and our complete line of IBM compatible printers, call, write, or TWX us today!

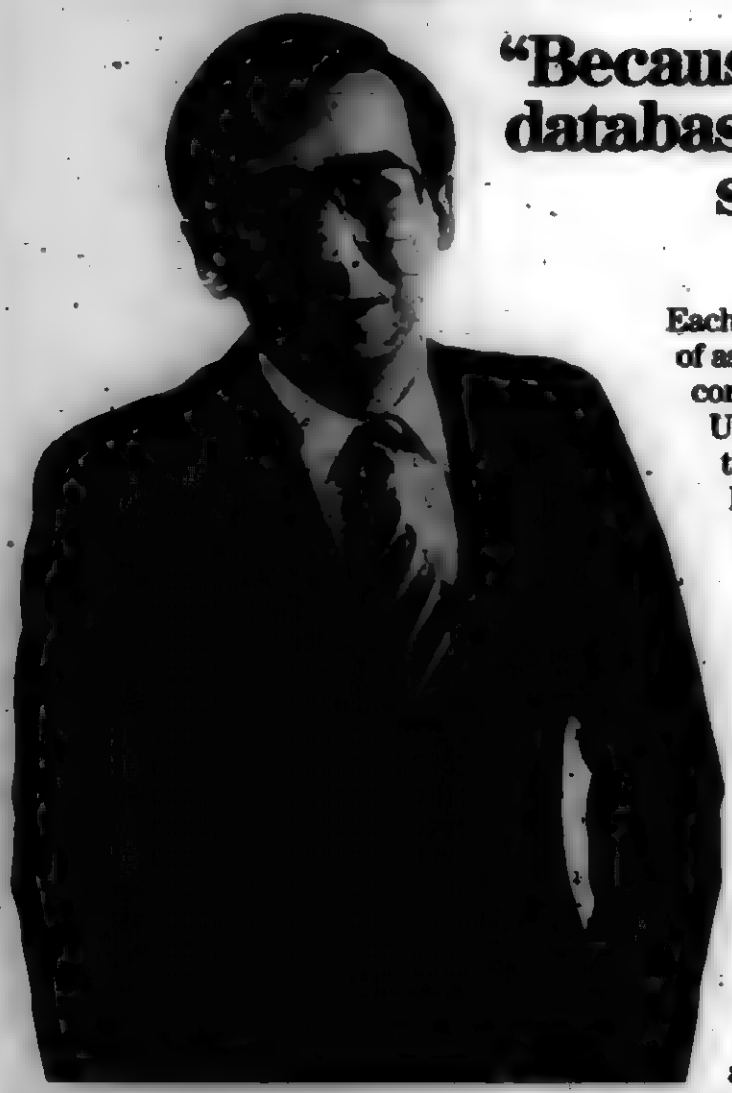
Why is Cullinet's information systems strategy creating so much interest?



"Because the strategy of integrating database, applications and decision support makes sense."

*Bob Goldman**

Each day, representatives of as many as eight major corporations from the United States and around the world visit Cullinet's headquarters. They are coming in increasing numbers because they've heard what Cullinet is doing in information systems technology. After the meetings, they are convinced that Cullinet's direction in information systems makes sense for their organizations. It is, in their opinion, the only coherent and intelligent approach available.

Specifically, this means the full integration of Cullinet's IDMS/R database management system, applications, including Manufacturing and Financial Software, and Decision Support Systems that link personal computers to the corporate mainframe.

In other words, a single source of software as opposed to the fragmented approach which has plagued the computer user in the past.

Often, these visitors return to our headquarters with the senior officers of their organization for an Executive Program. Senior management is interested to learn that there has been more progress made to deliver on the promise of computers for top managers during the past year than during the previous twenty. This promise of computing for top management is "knowing that they have a problem in time to take corrective action."

In order to fulfill that promise, the full integration of Database, Applications and Decision Support Systems is required. When management understands the importance of the integrated software solution, the result is a renewed enthusiasm by them for support of the information systems activities of their companies. They realize that their respective companies must put in place new information systems in order to compete or even survive in the future.

That, in the final analysis, is what Cullinet is about: providing a complete and integrated software solution for the 80's and 90's.

Call or write us for more information or attend a very informative seminar explaining this unparalleled software solution. To participate in one of the 700 Cullinet seminars scheduled internationally, send in the coupon or call 1-800-225-9930. In MA, 617-329-7700.

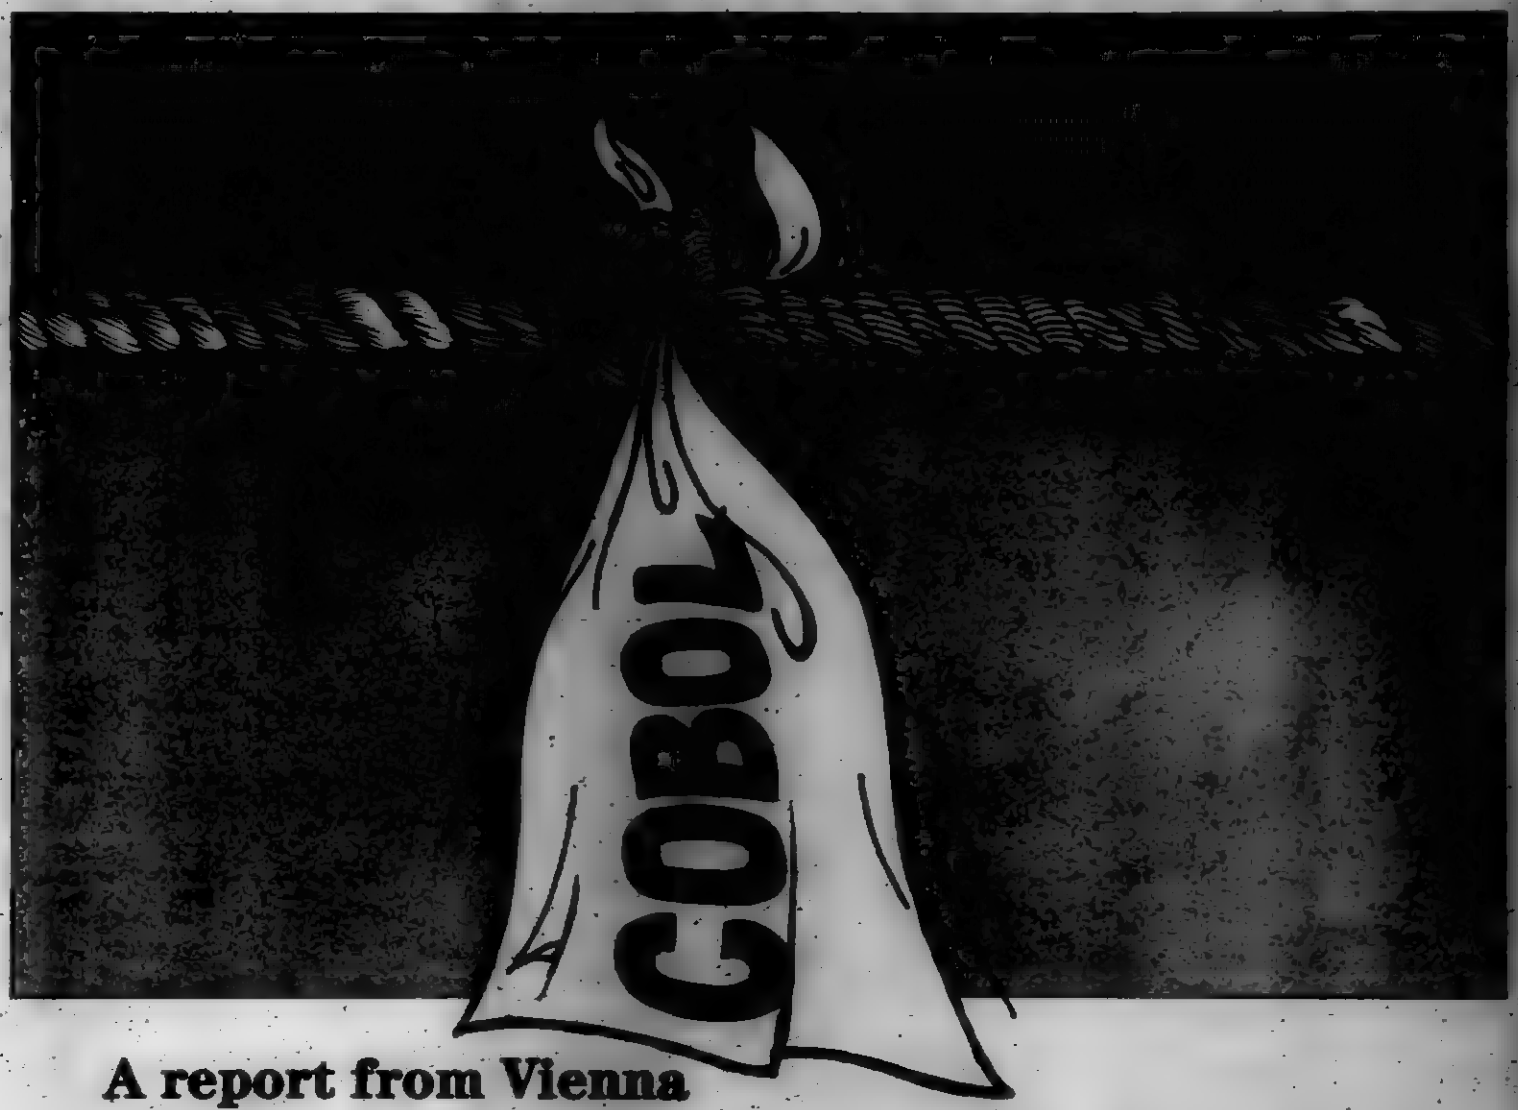
IN DEPTH



A report from Vienna

Which way Cobol?

By Ken Meyer

When the International Standards Organization (ISO) Cobol meeting adjourned Feb. 14 in Vienna, participants were surprised at the agreement achieved.

Two key decisions were made. One was to adopt the current draft standard (and some editorial changes) for Cobol drawn up by Ansi X3J4 and send it on to the parent committee, ISO TC97/SC5, for approval. No more changes to the draft standards! The second was to recommend that the standards development process be divided into two parts: 1) standards maintenance and 2) development of new features aimed at productivity for the programmer.

Twenty-four Cobol experts from the U.S., the UK, Canada, France, Germany, the Netherlands and Austria attended the ISO Technical Committee 97/Standing Committee 5/Working Group 8 meeting held at the Austrian Standards Institute. Japanese and Czechoslovakian groups did not attend, although their comments had been taken up on the second draft DP-ANS 747 at the WG8's predecessor Cobol Experts Group and then by the American National Standards Institute's X3J4 committee.

The Vienna meeting was the Experts Group's

Will ISO standards differ from Ansi?

Would Ansi feel obliged to accept an ISO standard?

sixth but its first as WG8. Mabel Vickers of the National Bureau of Standards is the convener of WG8; Jean Bourgain of CII Honeywell Bull is chairman, and Don Warren of Wang Laboratories, Inc. (also chairman of the Ansi X3J4 Technical Committee) serves as secretary. The U.S. is responsible for making up the draft Ansi specification in the X3J4 committee.

The X3J4 second draft "pink book" was issued for comment by the Computer and Business Equipment Manufacturers Association (Cbema) for X3 in July 1983. The three-month comment period closed Oct. 10. Comments to the draft standard were sent by 923 individuals or firms from six countries.

At its November and January meetings, the Ansi X3J4 Committee processed those comments. Approximately 700 are directly attributable to the work of Joe Brophy of Travelers Insurance Co. of Hartford, Conn. Brophy sent letters to more than 2,000 commenters on the first draft ("blue book"), offering suggested wordings for yes and no comments. Brophy has been concerned with upward compatibility between the last standard, ANS Cobol-1974, and the present draft (pink book), claiming that many features removed to the "obsolete" category and changes to the standard will cost his firm and others millions of dollars. Many firms agreed, sending photocopies of Brophy's letter as comment to Ansi X3J4.

The National Bureau of Standards, on the other hand, had presented to the U.S. government and to all interested parties a cost and benefit analysis for all programs in the federal portfolio showing a net gain.

At the three meetings of Ansi X3J4, changes have been made to the pink book in the "S" and "D" documents. These are recorded in substantive changes (84006) and editorial changes (84007). The response to Cbema comments has been mailed out. Commenters may respond until April 5. A new ballot will be taken of Ansi X3J4 (a third draft standard, if you like) on the changes between April 22 and the next Ansi X3J4 meeting May 21.

At the May 21 meeting, the responses of commenters, the results of the X3J4 letter ballot and the results of the WG8 meeting will be considered. If the results are more than two-thirds in favor, the pink book and the S and D documents will then be returned to X3.

If the X3 Committee is not in favor, an X3 committee will hold a 30-day ballot from June 20 through July 20. Comments will be considered between July 25 and Aug. 8. On Aug. 20, another X3J4 will meet again to review comments. All comments and negative votes will be considered then.

On Sept. 14, standards action will be taken by Ansi X3 and another public review will take place, like the first (blue) and the second (pink) draft, until Nov. 14. At the X3J4 meeting in December, a review of comments on all substantive changes will occur. The American National Standard may be adopted early in 1985 by X3.

International Cobol

A ballot must be held of TC97/SC5 for Cobol to be made an international standard. In the past, the ballot for SC5 has been taken after the standard has been adopted in the U.S. SC5 has solicited the international comments at the same time as X3 in the development of Cobol-8X. SC5 takes its own ballot, and it is conceivable that WG8 may meet to consider its objections after the American standard is set.

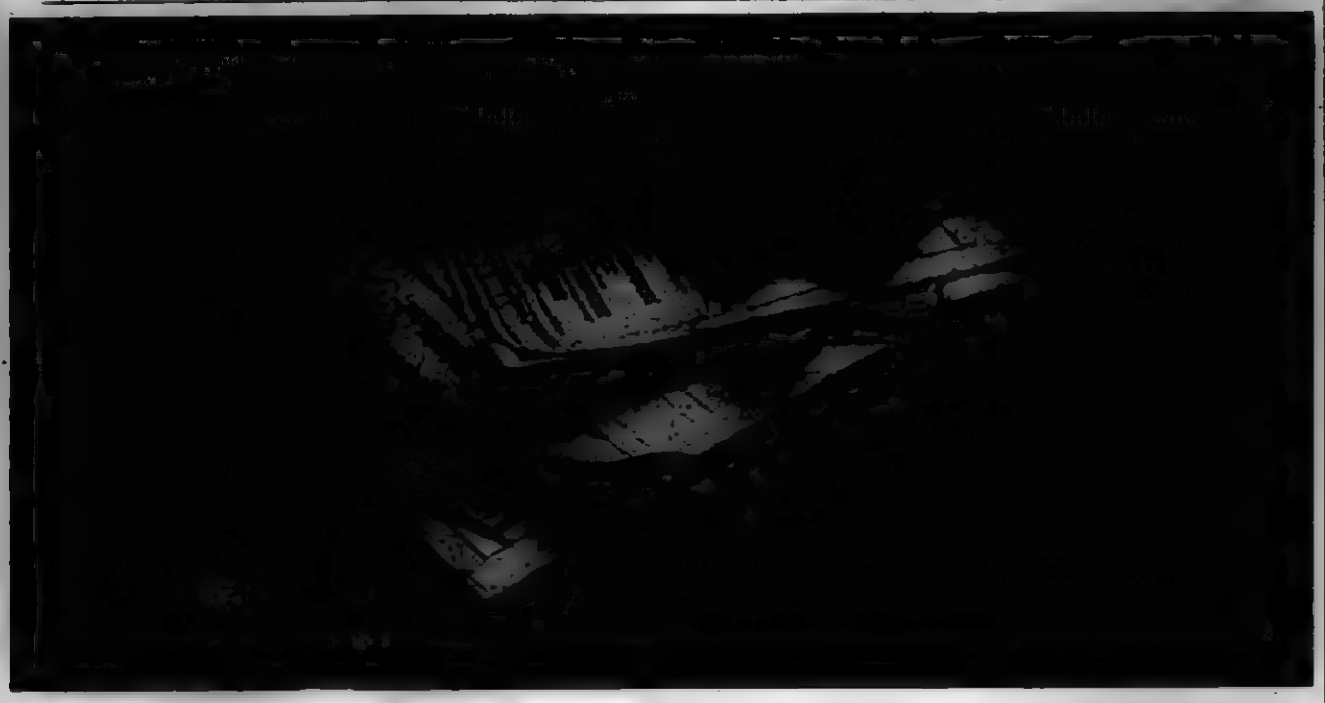
On the other hand, the SC5 committee might adopt the pink book plus S and D changes or the older blue book or (even) the 1974 standard. There is no guarantee that a separate standard might not exist internationally in addition to the ANS Cobol-8X. ISO SC5 is as freely democratic as Ansi X3 in the setting of standards.

If an ISO standard exists for Cobol, would Ansi feel obliged to accept the ISO standard?

Federal information processing standards (Fips) for use by the U.S. government may be chosen from either the ANS Cobol-8X or the ISO standard, if two exist.

Possible delay

There is a possibility of a one-year delay at several



It's time the technology of data collection caught up to the technology of data processing.

The speed of your data processing is limited by the speed of your data collection and input. Unfortunately, for a lot of people, data collection technology stopped with the development of the clipboard.

But MSI has changed all that.

Because MSI portable data collection systems are microprocessor-based answers to multipart forms. They actually extend the power of your central computer by allowing data to be keyed in right in the field. And then transmitted over ordinary phone lines to a host computer or data processing center.

MSI systems eliminate paper shuffling, keypunching, and errors by collecting data at its source. At the same time, we return control to the data processing department, eliminate costly time delays, and match the sophistication of your central system with our equally sophisticated remote system.

Our family of hand-held terminals can be used anywhere there's data to be collected. For salesman order entry, inventory control, financial reporting, manufacturing control, and field data collection tasks of all kinds.

Learn how MSI data collection products can bring your system to the peak of its capabilities. Just return the coupon.

You'll find the technology of data collection is right where you want it.

IN DEPTH/COBOL REPORT FROM VIENNA

stages in the review for ANS Cobol-8X. Wim Ebbinkhuijsen of the Netherlands expressed the concern of the group that the standard would be delayed yet again. With problems of potential disagreement in the CLASS, PERFORM, SYNC and OCCURS . . . DEPENDING clauses, further changes might be made in May.

Comments of WG6 continued, as it was visualized that Joe Brophy might unduly influence the Ansi X3J4 Committee to regress into older and outmoded forms of Cobol, to retain features like the RERUN clause which, when implemented and used, is strictly implementer-defined. The pressure to change the standard mounts to repeat the good work for the sake of upward compatibility.

Of the 923 people commenting on the standard, 58 approved of the second draft. Still there must be a silent majority of perhaps 100,000 people, Jerry Garfunkel said, who are sufficiently satisfied with the pink book not to oppose it. Not to oppose is to abstain and, by implication, agree.

Overwhelming support for the standard exists in the UK and the world, I observed. Mechanisms for changing the standards must be provided that aim at "productivity aids."

The first day of the meeting covered the majority of the agenda, including a vote on each of the substantive changes in the S and D (84007).

Some countries had written substantial comment, like Czechoslovakia, but were absent from the WG6 meeting.

Also covered was the list of comments (with X3J4 answers) from international sources and another from the U.S. to X3J4. Each of the categories was called out with some discussion, questions and clarifications by the group. It is possible that the reconciliation of the comments and answers to comments in these papers will cause X3J4 to reconsider and expand the S and D lists.

Two standards?

The chairman asked whether the group would be in favor of a direction to X3J4 to send the pink book plus the S and D changes to TC97/SC5 immediately. This first of the straw votes on recommendations for a standard passed 12-3. It was obvious that the sentiment of the group was to shorten the time required for completion of the standard.

Another straw vote was taken on directing X3J4 to send the pink book plus any S and D changes made, including the May meeting. This vote, favored by the X3J4 representatives on WG6, tied at 10-10.

A third straw vote, to take the pink book only, failed to receive an affirmative vote.

The WG6 had moved to direct X3J4 to send the pink book plus the S and D documents as of the January X3J4 meeting to TC97/SC5 as the candidate for the Cobol standard. This would be subject to a two-thirds ballot.

As if there was some doubt and because of the tied vote for the May option, the chairman required a clearer resolution. The debate continued. Willy Walz pointed out that new features were required in the language. Now that microprocessors were widely used, a new Cobol standard was required immediately, before the new features were added to the compilers in a nonstandard fashion.

The Canadian Computing Services and Supply representative, N.E. Fowrer,

Of the 923 people commenting on the standard, 58 approved of the second draft. Still there must be a silent majority of perhaps 100,000 people, Jerry Garfunkel said, who are sufficiently satisfied with the pink book not to oppose it. Not to oppose is to abstain and, by implication, agree.

Computer Interruptus

Midnight. And you wish you would be left in the dark. But miles away in the DP Department, a misplaced DD override, an invalid concatenation, or some other equally obscure JCL error brought production to a standstill.

And when the system breaks down, it's you or your staff they call up. Which usually means getting up and getting down there. And after a night like that, how productive will the morning be?

What a waste. If you had the JCLCHECK™ program, you wouldn't have JCL errors, period. None. Zilch. Zero.

Because the JCLCHECK program can catch any and all JCL errors and give you complete, on-line JCL validation and concise error diagnostics. Plus complete documentation on a job stream or entire production system suitable for insertion in the run book. And it can operate under TSO, TONE, ROSCOE or CMS.

Imagine, with no more JCL errors, your programmers can finally concentrate on what you hired them for: writing programs.

So what are you waiting for? Send the coupon or call us at (408) 554-8121 for details. We'll show you how the JCLCHECK program can bring your error detection out of the dark ages, increase production, and eliminate applications backlog. And that'll put you in the spotlight.

I'm frustrated and tired of JCL errors.
☐ Send me details on the JCLCHECK program.
☐ Have a representative call me.

urged an early passage of the standard so that work could be carried on by using the Conference on Data Systems Languages (Codasyl) Cobol Committee's *Journal of Development*.

The WG8 was concerned that the abstentions in May would change the proposed standard at X3J4. Chairman Bourgain requested a vote. If the pink book and the S and D as of May 1984 were used, a mail ballot should be taken of members of WG8. If no majority was possible, the pink book would be taken along with the S and D of February. This move succeeded, but not decisively, 9-7 with eight abstentions.

"Failing the ballot, a decision should be made afterwards" was not successful, 4-12 with eight abstentions, because it would not give a firm declaration and might result in delay.

The crucial vote was framed formally by Don Warren that the X3J4 be directed to send N747 (the pink book) with 84006 and 84007 (S and D changes) to TC97/SC5. This resolution passed 14-3 with seven abstentions.

The meaning and implication of the vote were clear. Abstentions, corresponding to X3J4 members, had been "no" votes. A two-thirds vote had been cast for the resolution!

Two standards processes

The group now turned to consider the method of making the standard. Jerome Garfunkel, noted lecturer and educator on Cobol and other languages, had drafted three papers, one of which dealt with a compiler switch that would cause incompatibilities with the new standard without the obsolete category, to be flagged. This had been handled outside WG8 and was noted.

Garfunkel's 83026 dealt with the incompatibility issue and was the lead paper for the discussion of WG8 in the second half of the morning session on the second day.

Addressed to the newly created Ansi/Sparc on Programming Language Systems Group (PLSG), which deals with matters of interlanguage relations, it is, like the WG8, a liaison group. It will study the issues to identify new features such as screen handling across all languages.

Garfunkel wrote that the standards process is divided into two parts:

1) New developments that arise and enhance the language, like the EVALUATE verb and the scope terminators (END-IF).

2) Revision to existing standards to reduce ambiguities, eliminate unused or archaic clauses and to codify practice.

If the standards community can identify new developments and separate these from the revisions, the standards cycle can be sped up from its current five to 11 years. New developments have less controversy in their debate. Therefore, the validate facility [CW, Nov. 7], screen management and data base could be sped in their incorporation into a new standard.

At the same time, the "fixing-up" procedure can proceed, at its own pace, to reduce ambiguities, inconsistencies and dead wood.

How did the procedure develop to publish a separate data base addendum to the Cobol standard? Mabel Vickers answered that the charter of the group from TC97 had included this point specifically. Otherwise, X3J4 would have had to wait for completion of work by X3H2.

There is no provision at present for any supplementary or developmental standards at a different cycle other than the five-year maximum.

'Cobol family of languages'

Garfunkel continued to explain his paper (see letter to *Computerworld*, Nov. 28). Productivity aids are required within a "Cobol family of languages" in which modules are created to deal specifically with new problems. He stopped short of the theme that Cobol should be permitted to evolve into a fourth-generation language. Everyone knew that he had this in mind.

I called for productivity aids which are necessary to meet current needs: validate, intrinsic functions, screen management and report writer enhancements.

These modules could be completed in less than five years by the Codasyl Cobol Committee, as their specified responsibility is for language development.

The only possible incompatibility that could arise is in the new "reserved words." This incompatibility could be solved with a REPLACE statement as a compiler directive.

Wim Ebbinkhuijsen reminded the group that Ansi is required to work on a new standard at least every five years. ISO could perhaps support such a development.

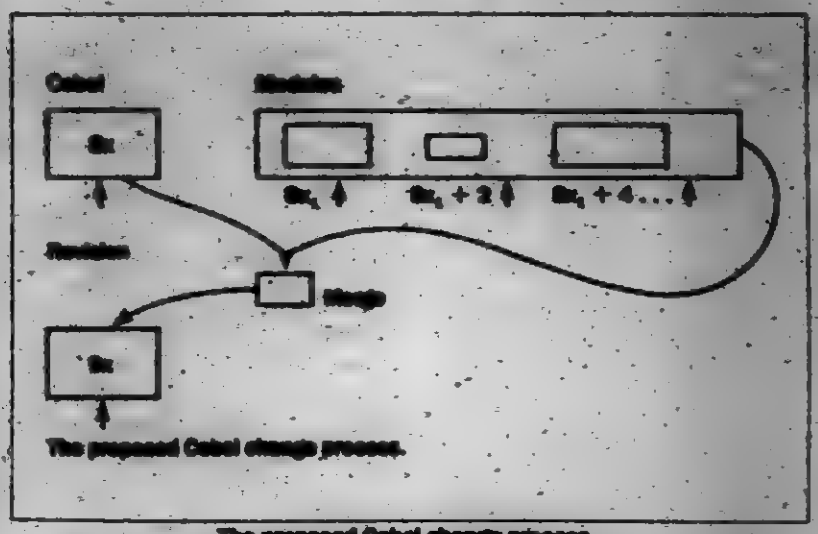
Weiss added that the change could indicate which optional modules would be included.

Bourgain thought that producing a model every several years was worrisome and that it was best to keep the old cycle and stick to a compatible revision. Others shared this view.

Garfunkel replied that a smaller subset should form the NUCleus of the language, including SEGmentation and LIBrary. Report writer and communication should comprise a separate module.

Alan Fryer of Micro-Focus, the principal supplier of microprocessor Cobol, expressed some alarm at the possibility of separate modules, standards or committees. His firm has passed testing procedures for ANS-74 and has now moved to support productivity aids for users.

In the matter of establishing separate standards and addendums, questions arose about how much the orig-



The proposed Cobol change process

inal charter of WG8 included. The WG8 is a liaison group, and X3J4 is the draft language standard group.

At any rate, the question of to whom any resolution should be addressed could not be reconciled.

Weiss continued to question the structure of a newly formatted language. New modules should be created compatible with the 8X standard, but the division between modules was important, too. If the validate facility were put in the NUCleus, then it would become mandatory and not a separate feature. All modules should be based on the Codasyl Cobol Committee placement.

The standard needs to be driven by Codasyl and without a specified time. Two years may turn out to be reasonable.

Jeanette Peters of IOL said that her organization had compiler writers who had many ideas, some of which the customers would not want implemented. A number of communitive ideas garnered many modal hits other facilities like dictionaries and utilities.

Two processes

Don Warren said that the scope of changes was too large, but that a couple of features could take less time, in fixed cycles, say, Cobol-84, Cobol-87 and so on.

Weiss and Garfunkel collaborated to draw the diagram at left. Repairs to the standard are to continue at the same time as modules are created. All modules must be upward-compatible with each other and the base standard. When repairs have been completed, a final merge takes place into a new comprehensive standard, say, Cobol 9X.

Some objections were raised to the specification of detailed workings of the language revision process, but I insisted that "if this is a historic meeting, the guidelines should be written now." It was possible that other interpretations could come from any resolution.

The group proceeded to discuss some cases that might occur in the development process. All modules should be in accordance with the previous standard and modules. The update in '88 should include '86 and serve to increase the capability of the language.

Two matters of concern were reserved words and picture-character-symbols, two fundamental parts of

IN DEPTH/COBOL REPORT FROM VIENNA

the language.

Procedurally, a mechanism could be described and sent to SC5 by X3J4, asking for a change in the bylaws. SC5 would then enable X3J4 in its charter to include a working item (a requirements SD). The basic idea would be worked out at WG5 and forwarded, perhaps to WG16, as a concept for solution.

Jeanette Peters of ICL proposed that Garfunkel's paper be forwarded to SC5 for assignment to WG16. This motion passed 19-0 with four abstentions.

This represented clear-cut support for the paper. Garfunkel drafted a resolution with Meyer, Abe Lange of the Netherlands Defense Ministry and Georges Lewin of France's Bindi.

The resolution to be forwarded to SC5 and to X3J4 was that, after the conclusion of the work on Cobol 8x, the language should be broken into two distinct processes. One, the revision process, should continue as at present with an interval of approximately 10 years for issuance of a long-term standard.

Second, that at approximately two-year intervals (8x+2, 8x+4),

The consideration and improvement of languages is far from dull, populated with people with good ideas, stamina and judgment.

modules aimed at specified topics or features and compatible with the base standard and previously passed modules should be published.

This motion passed 16-3 with four abstentions. It was clear that the current mood of the WG5 was not only to accelerate the current standard, but to create an environment that would encourage good standards in the future in two modes: Let the present method remain to clear out obsolete items, pare the language, look for faults and possible ambiguities and argue over interpretations of the workings of the generated code.

Let there also be a means for helping programmers and management alike to reduce the time necessary to produce programs by expanding the language to meet specific needs and problems, as in the validation facility or screen management. Work should proceed toward perfecting and expanding existing features to meet competing products in the marketplace like Visicorp's Visicalc by improving the report writer feature. The conceptual base should be improved by providing intrinsic and precoded functions.

Tomorrow, graphics must be considered. The interface to data dictionaries must be recognized. The update and analyze feature could remove the OPEN and CLOSE statements. For a trial period, verbs may be allowed for clustering local abbreviations through a Cobol macro generator facility, perhaps following another UK development, the British Computer Society's Cobol Language Extension Facility (Clef) from University of Manchester Institute of Science and Technology (Umist).

The consideration and improvement of languages is far from dull, populated with people with good ideas, stamina, judgment and persistence. If several standards emerge (Ansi vs. ISO) and new processes of making standards are recognized in separating the old from the new, the result will represent the frustrations, hope and trust of an international community dedicated to a sound, workable language, Cobol.

About the author

Ken Meyer has been active in data processing since 1955 with Pure Oil (now Union Oil), Creole Petroleum (Exxo) in Venezuela, Control Data Corp. and British Gas. He now consults, writes and lectures in the UK.

Meyer serves on the ISO Cobol working group (WG5) and belongs to the Association for Computing Machinery and British Computer Society. He strongly favors the recommendations of WG5.

You Can Read Some of the Dumps... Some of the Time...

In the past, programmers had to slave over monumental stacks of paper to resolve abends.

Trying to convert hexadecimal numbers like four score and seven or debating over where the abend occured was as tough as splitting logs.

But then was brought forth a new notion — Abend-AID. It was a great moment in dump history. Programmers were emancipated as the drudgery of solving abends was abolished. They were free to devote their time to more productive tasks.

Abend-AID transfers the burden of debugging from the programmer to the computer. Abend-AID output shows What Happened, When it Happened, Where it Happened and supplies the necessary supporting data in an easy-to-use format that can almost fit on the back of an envelope (10-12 pages, in English).

Abend-AID is available for both IBM OS and DOS installations. Listed below are unique Abend-AID options for your specific needs.

☐ **Abend-AID/COBOL** — The first practical source level debugging tool.

☐ **Abend-AID/SPF** — 80 column "easy-to-use" viewing capability which permits programmers to interactively debug abends at their terminals.

☐ **Abend-AID/ONLINE** — 80 column CRT output for easy viewing.

☐ **Abend-AID/DOS/DLI & Abend-AID/OS/IMS** — Features special diagnostic routines for IBM's data base systems.

Free Abend-AID Product Evaluation.

For additional product information, or to arrange for your 30-day FREE evaluation of Abend-AID, just give us a call at 800-521-9353 (in Canada or Michigan, 313-540-0400), or clip your business card to this ad and mail it to: Compuware, Systems Software Division, 32100 Telegraph Road, Birmingham, Michigan 48010.

Abend-AID. The civil way to address program abends and cancels.

IN DEPTH

On-line transaction processing

By Waguih Boctor and Kenneth I. Cohen

Item: Major financial institutions are turning away from batch-oriented data processing.

Problem: Most "mainline" financial applications are large, batch operations; isolated satellite minis provide on-line services for specific applications. At night, the results of the on-line applications are memo-posted to the "real" batch system data bases.

Solution: Reverse the emphasis: Batch becomes the secondary satellite process. When mainline operations are put on-line, the batch applications that remain (for example, bulk proof and transit) will operate on satellite batch machines.

Item: Large manufacturing and distribution companies are abandoning the paper-bound batch systems they've grown up with.

Problem: Customers order and complain in "real time," workers work in real time, and carrying costs of inventories and other assets accrue in real time. More and more, batch processing handles just daily, weekly or monthly reports.

Solution: Controlling costs, boosting responsiveness and managing more effectively can be achieved by on-line data bases. All operational and management staff can use the same up-to-date information, and the systems can be proactive tools of doing business, not reactive reporting burdens.

Item: Government agencies are under pressure to control costs, eliminate waste and fraud and provide improved services.

Problem: State programs implemented at the

VM/SP Graphics Users

Tired of playing roulette with your graphics environment?

SAS/GRAPH® and GDDM users can now spool and manage graphic printouts through the ACX-PM™ Printer Manager as if they were normal listings. county level are rife with abuses: Individuals drive from county to county picking up checks or get eliminated from a program in one county and simply file for benefits in a neighboring one. Systems are either manual or uncoordinated between jurisdictions. By the time abuses are discovered, much money has been lost.

Solution: Needed are on-line data bases with shared accessibility to accurate and timely data. And if the legislature or oversight agencies require summary batch fiscal data, they will periodically roll up the numbers from the on-line data base.

Item: The complexity of national defense and the volatility of world developments require more responsiveness by the military and intelligence agencies than ever before.

Problem: Coordination and deployment of military personnel and materiel through batch-oriented logistics systems make rapid and sustained deployment a nightmare. The information in the reports used for decision making reflects a snapshot of the past, not current reality.

Solution: The military services are looking for instantly available information, updated as things happen and available as needed. The solution is on-line data bases with broad but secure accessibility from all points in the command.

Enter transaction processing

Whether the user is a bank president, a warehouse picker, a social worker or a lieutenant, the requirements for shared, on-line use of a large data base present a similar set of challenges to the data processing community: the creation, maintenance and operation of on-line transaction processing application systems.

Imagine writing such an application as if it were single-threaded. Imagine never coding explicit checkpoints, error recovery, data base deadlock prevention, fault tolerance or data base integrity scenarios. And imagine not having to consider system tuning and terminal load balancing in your design. Finally, imagine all the above, plus a high-performance relational data base management system (DBMS). By taking user requirements and translating them into system requirements, it is possible to define an on-line transaction design model that accelerates development of on-line systems.

In its simplest form, transaction processing is the use of a large data base by a large, on-line user community. On-line transaction processing can be differentiated from older on-line inquiry systems by the requirement for simultaneous on-line retrievals *and* updates to a data base.

The successful implementation of these transaction processing applications implies that every business decision can be predicated upon the most recent transactions. Clearly, the motivation for increased use of on-line transaction processing systems lies in the powerful management and operational capabilities.

Definition: the transaction

The term "transaction" is used in different ways throughout the business and data processing communities:

- **Work units** — People frequently refer to a transaction as consisting of all the work needed to perform a unit of work in the application. Some examples of this definition might be "entering a customer order" or "creating a new employee in the personnel system."

  Note that many terminal interactions and data base updates are generally involved in such user-level work units, what we refer to as "application units."

- **Messages** — Since on-line transaction processing systems are dialogue-oriented, a user's request-response interaction with the system is frequently called a transaction. We will refer to such user conversations as "message pairs" in this discussion.

- **Data base transaction** — The activity in this type of system results in the transition of an integrated data base from one consistent state to another. This issue of data

CUT YOUR COBOL TEST AND DEBUG TIME... AND YOUR COST!

XPF/COBOL is the first full-screen, interactive, SPF-like debugging tool on the market. It delivers a complete window into COBOL programs.

XPF/COBOL enables the user to:
- Watch the programs execute—forward or backward.
- Find and change COBOL data in COBOL format.
- Debug IMS programs.

XPF/COBOL:
- Slashes test and debug time.
- Increases programmer productivity.
- Is easy to learn and easy to use.

XPF/COBOL can pay for itself in months.

Call your nearest Boole & Babbage sales office below, or send in the coupon for complete information and user references.

WHEN IT COMES TO SOLVING BUSINESS PROBLEMS, ONE COMPANY IS A MILLENNIUM AHEAD.

Although we'd all like our business problems to fit into neat little compartments, they never seem to want to go there. Take a simple general ledger variance in your New York office. For some strange reason, it connects to a large office supplies transaction in London, which really turns out to be an erroneous distribution of a capital equipment expenditure to Peoria through your accounts payable system.

A business person can only unravel such mysteries by opening his or her mind and following the trail wherever it leads. Using business software to help.

But is your software giving you the help you really need?

Several years ago, a team of McCormack & Dodge researchers uncovered a remarkable paradox:

Business problems don't fit into compartments. Yet even the most sophisticated software packages operate on the principle of compartmentalization. In the very same vendor product line, you find general ledger packages designed one way, accounts payable another, fixed assets yet another. In actual use, these separate designs become separate walls. Barriers to problem-solving.

Even though your mind wants to move freely from one system to another, roadblocks hold you back.

Because McCormack & Dodge researchers identified this paradox first, we are years ahead of the industry in overcoming it. Our Millennium series is designed and built, from the ground up, as a genuinely borderless product line. A true family of systems in which the whole works as smoothly as any part, making the most efficient use of all your data processing resources.

With Millennium, and only with Millennium, a business person asking a question in one system can instantly enter a correction in another, seek an answer in a third, update a fourth—and move with total freedom through the entire vast information universe.

When it comes to solving business problems, McCormack & Dodge is a Millennium ahead. Shouldn't you be too?

WHEN YOU THINK ABOUT TOMORROW, MILLENNIUM MAKES SENSE TODAY.

McCormack & Dodge

base transitions and internal consistency is both the objective of on-line transaction processing and critical to maintaining the data integrity required in all applications.

In our discussion, we will use this concept of the data base transaction as the definition of a transaction. This definition is appropriate because of the data base orientation of on-line transaction processing applications.

Data base consistency

Data base consistency requires that multiple data base updates be treated as an atomic unit. This unit is called a transaction. The concept of data base consistency is rooted in double-entry accounting, which requires that any change in one part of the "books" must have one or more offsetting entries in another part. For example, when a customer pays a bill, several updates must be made: The cash file must reflect the payment, and the accounts receivable file must be adjusted to reflect the customer's reduction of his debt.

In on-line transaction processing applications, the dozens, hundreds or thousands of individuals at their terminals directly generate system work load. This situation stands in contrast to batch systems, where the data center staff provides a gating function for work arriving at the system.

In a data base application, this change requires that at least two files be updated. Physically, there are at least two update activities, and a broad range of failures can intercede between the two.

Data base integrity requires, however, that the system use *some* technique to ensure that only complete sets of updates are made permanent. In the event that completion of all updates in a transaction is not possible (let's say that a power failure or disk head crash intervenes), the integrity mechanisms of the DBMS must ensure that updates of uncompleted transactions are backed out of the data base. Through these mechanisms, the "books" will never be out of balance.

Application characteristics

A complex of user needs defines the application implementer's challenge in creating on-line transaction processing systems. In addition to application-specific needs, there is a generic set of requirements that such systems must fulfill. Note that all of these needs must be fulfilled by the finished application system.

The issue of system software models and facilities is very relevant here. If the system software doesn't do them, then they become the responsibility of the application software and the application programmer.

In on-line transaction processing applications, the dozens, hundreds or thousands of individuals at their terminals directly generate system work load. This situation stands in contrast to batch systems, where the data center staff provides a gating function for work arriving at the system.

The implications of user-driven work load are that:

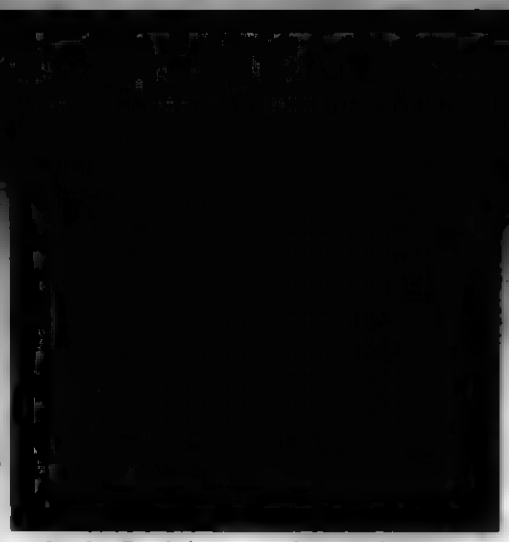
- At any time of day, users expect a consistent, fast response to their requests.
- Random message arrivals result in statistical queuing effects on the system that place instantaneously enormous demands on system resources.
- There are no "make-up" shifts for work that could not be finished during normal system hours. System outage results in an unacceptable loss of real-time transactions. To avoid this situation, either manual backup systems must be maintained or (preferably) the system must provide continuous availability and on-line backup capability.
- User work can't be rerun. Whereas a batch run that fails can be rerun using the original inputs, on-line transaction processing inputs are from sources who may not be around to re-input their messages. For example, once an automatic teller machine customer leaves the kiosk with money in hand, he won't return to repeat his transaction for the benefit of system recovery. This situation results in the need for a recovery facility that ensures that all completed transactions are permanently reflected in the data base and that work in process can be recovered and continued after a disruption of service.

Data accuracy

It is important that operator errors be caught early in the system so that contaminated data doesn't reach the data base. Thorough and efficient data validation facilities are essential. While validation can always be performed at the application program level, it is far more desirable to have the front-end system software perform the validations to minimize overhead and decrease programming effort.

Another contribution to improving the validation capabilities of on-line transaction processing systems is the presence of an active data dictionary in which standard validation definitions for all data types in the system are cataloged. The

PICK UP WHERE IBM LEAVES OFF.



Portable or desktop, you're way ahead when you pick up CORONA PC™ Because we give you everything you've ever wanted in an IBM[1]-compatible PC and more. For a great deal less.

COMPATIBLE AND MORE.

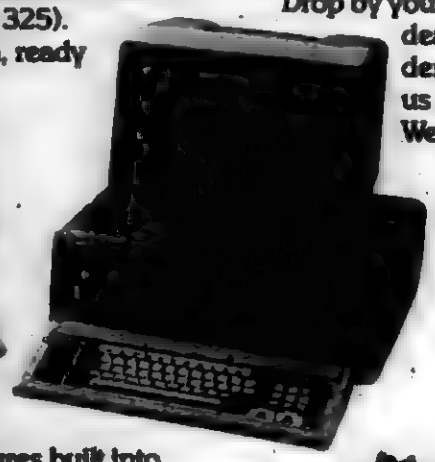
Our systems run all software that conforms to IBM PC programming standards. And the most popular software does.

We deliver twice the memory, with room for eight times as much.

We deliver a fast-access 320K floppy drive, a communication port and an improved IBM PC keyboard with indicator lights.

Our systems include high-resolution monitors (12" desktop, 9" portable) for crisper, cleaner displays, and both have built-in high-resolution graphics (640 x 325).

You get a complete system, ready to go to work.



MORE VERSATILITY.

With all the necessary features built into the main unit, the four expansion slots can be used for your special needs. For example, color or our optional 10MB hard disk.

software gives you temporary disk-type storage that works many times faster than disks.

PLUS SOFTWARE.

Our systems come with the operating system: MS-DOS.[2] A programming language: GW BASIC.[2] A training course: PC Tutor.[3] A professional word processor: MultiMate.[4] Plus DOS utilities and demonstration programs. Or you can get the p-System[5] from N.C.I. and write or run portable Pascal packages.

ALL FOR A GREAT DEAL LESS.

Even with all the extra features and performance, our systems still cost significantly less than the equivalent IBM PC.

Drop by your nearest CORONA PC dealer for a very convincing demonstration. Or contact us at 31324 Via Colinas, Westlake Village, CA 91361. (213) 991-1144 or (800) 621-6746 toll-free. Telex 658212 WSLK, in Europe 76066 CDS NL.

dictionary can be efficiently accessed as needed by the system and application software.

As discussed above, data base accuracy and consistency are mandatory, regardless of the nature of the application. The software required to preserve data integrity is extremely complex and places undue demands on programmers when implemented at the application level. A critical consideration in the development of an on-line transaction processing model is the automation of data integrity at the system software level.

High system availability

End users become increasingly dependent on on-line transaction processing. If the system is unavailable, the ramifications are pervasive.

Increasingly, though, the need for availability is being addressed through truly fault-tolerant systems, which can recover rapidly from any failure.

Moreover, the extra hardware required for fault tolerance generally contributes to performance during "normal" production.

Successful on-line systems grow in both work volume and application diversity. It is thus important that the system be compatibly expandable without disruption of existing applications.

Long 'think' times

With on-line transaction processing applications, users have long think times; in other words, their messages are separated by long periods of reading the last response, thinking about their next message and keying the input. Once a message is transmitted, however, the user expects a response in, at most, a few seconds. To provide high throughput for a large user community, it is vital that the on-line transaction processing model recognize this characteristic.

Even the most on-line of application systems includes a portion of activity that is inappropriate to the on-line work mode. On the one hand, classical batch work loads are created by the on-line system; on the other, on-line activities can spin off batch jobs for background processing. Once the background job has been submitted, the terminal user can continue with interactive work and expect to be notified on completion of the background activity. Typical examples of such asynchronous transactions are auditing and printing functions, which do not always need to hold up the interactive terminal while they are in progress.

The sensitivity of on-line transaction processing applications requires that the data base be secure from unauthorized use and that users be protected from one another's accidental or deliberate attempts to trespass on another's territory. It is thus crucial that the system software provide a protected environment for the data base and the user community. The security and protection facilities must not only yield a controlled environment but also provide a *controllable* environment. This need translates into a security/protection system that is auditable and easily administered by suitably privileged users.

Successful on-line systems grow in both work volume and application diversity. It is important that the system be compatibly expandable without disruption of existing applications.

Often, development and testing will proceed on the same system being used for production applications. Both environments must therefore be concurrently supported with strict controls to prohibit interactions between them.

Model requirements

Translating user needs into system-level requirements results in the following requirements for on-line transaction processing systems:

1. Total integrity and consistency of the data base must be preserved.
2. Many small execution units are generated by many users. Each request is small, but the aggregate of requests is large.
3. Resources must be equitably distributed among users. The motto might be "the greatest good for the greatest number." This goal boils down to a *throughput* objective, rather than individual *response-time* objectives. In fact, consistent response at a particular level is more important than the measured response time for any selected user.
4. The data base and the application must be continuously available to the user community.
5. The user interface must be dialogue-oriented, in which the users conduct screen conversations with the system.
6. Because successful on-line systems always grow, the extensibility and maintainability of the application are vital.

Functional requirements

Having analyzed the typical on-line transaction processing application characteristics and derived the general features of the system, we now attempt to translate these features into more detailed functional requirements, which a system model must be capable of fulfilling.

1. The model must take advantage of the long think time typical of these applications and minimize the amount of machine resources being used by such "thinking" users so

How To Implement The Best New PC Decision Support Software With A Pair Of Scissors.

YES. Tell me more about The New Context MBA and The Corporate MBA.
☐ Have a Context representative call me.

Name _____

Title _____ Company _____

Address _____

City _____ State _____ Zip _____

Area Code _____ Phone Number _____

SEND TO: Context Management Systems, 23868 Hawthorne Blvd., Torrance, CA 90505.
Or call us at 1-800-637-1515 (In CA, call 1-800-552-2537)

Now it's easy to select the right decision-support software for the PC users in your company.

The New Context MBA™ and The Corporate MBA™ both have all the functions PC users in your company need: Spreadsheet, Business Graphics, Database, Word Processing, Telecommunications, and Forms Creation.

They're all *integrated* in one software package. With advantages that'll make your life a whole lot easier.

Like full 3270 emulation. So *you* can connect their PCs to your Data Center network. For immediate, yet controlled, access to decision data. No more hand-holding or custom programming.

PC users in your company get the decision-support capability they need from a single, easy-to-learn package. And you get an easy way to plug one PC software package into the entire company.

Our Context 500™ support team builds a custom training and ongoing support program for your company, so *you* don't have to.

Now *your* job of supporting *our* software is as easy as picking up the phone.

So make it easy on yourself. Cut out, fill in, and send us this coupon. And cut out a lot of heartburn over which of many PC software packages to choose.

Now where did you put those scissors?

that large instantaneous quantities of resources can be devoted to providing response to the other "waiting" users. The system can thus multiplex large numbers of users on the finite set of available resources (CPU, memory, I/O channels and so on), thereby minimizing queuing and other traditional bottleneck problems that are typical of the on-line environment and could quickly become the limiting factor in how well a system can perform.

2. The model must support a comprehensive and user-transparent recovery mechanism, guaranteeing that no data already committed to the data base will be lost and that application state can be completely recovered and restarted after a system failure. This support must be optimized to reduce the amount of time the entire application system, and not just the CPU, is unavailable to users. The direct benefit is to relieve application designers and programmers from having to worry about explicit checkpointing and so on.

3. The model should eliminate the need for any application code to perform data base concurrency control and deadlock prevention. The model should also eliminate, or at least reduce, the amount of application code needed to perform validation of input data from the application user, as well as validation of the data being stored in the data base.

4. The model should provide extensive system security at several levels. User access to the system must be checked and validated at log-in time. Further access to the system facilities must be confined to that set which has been designated as accessible to them by the installation manager. In addition, all processing done by the system on behalf of a user must be performed in isolation from all other users, and the model must guarantee that no user data currently being processed can be communicated or otherwise made accessible to other users.

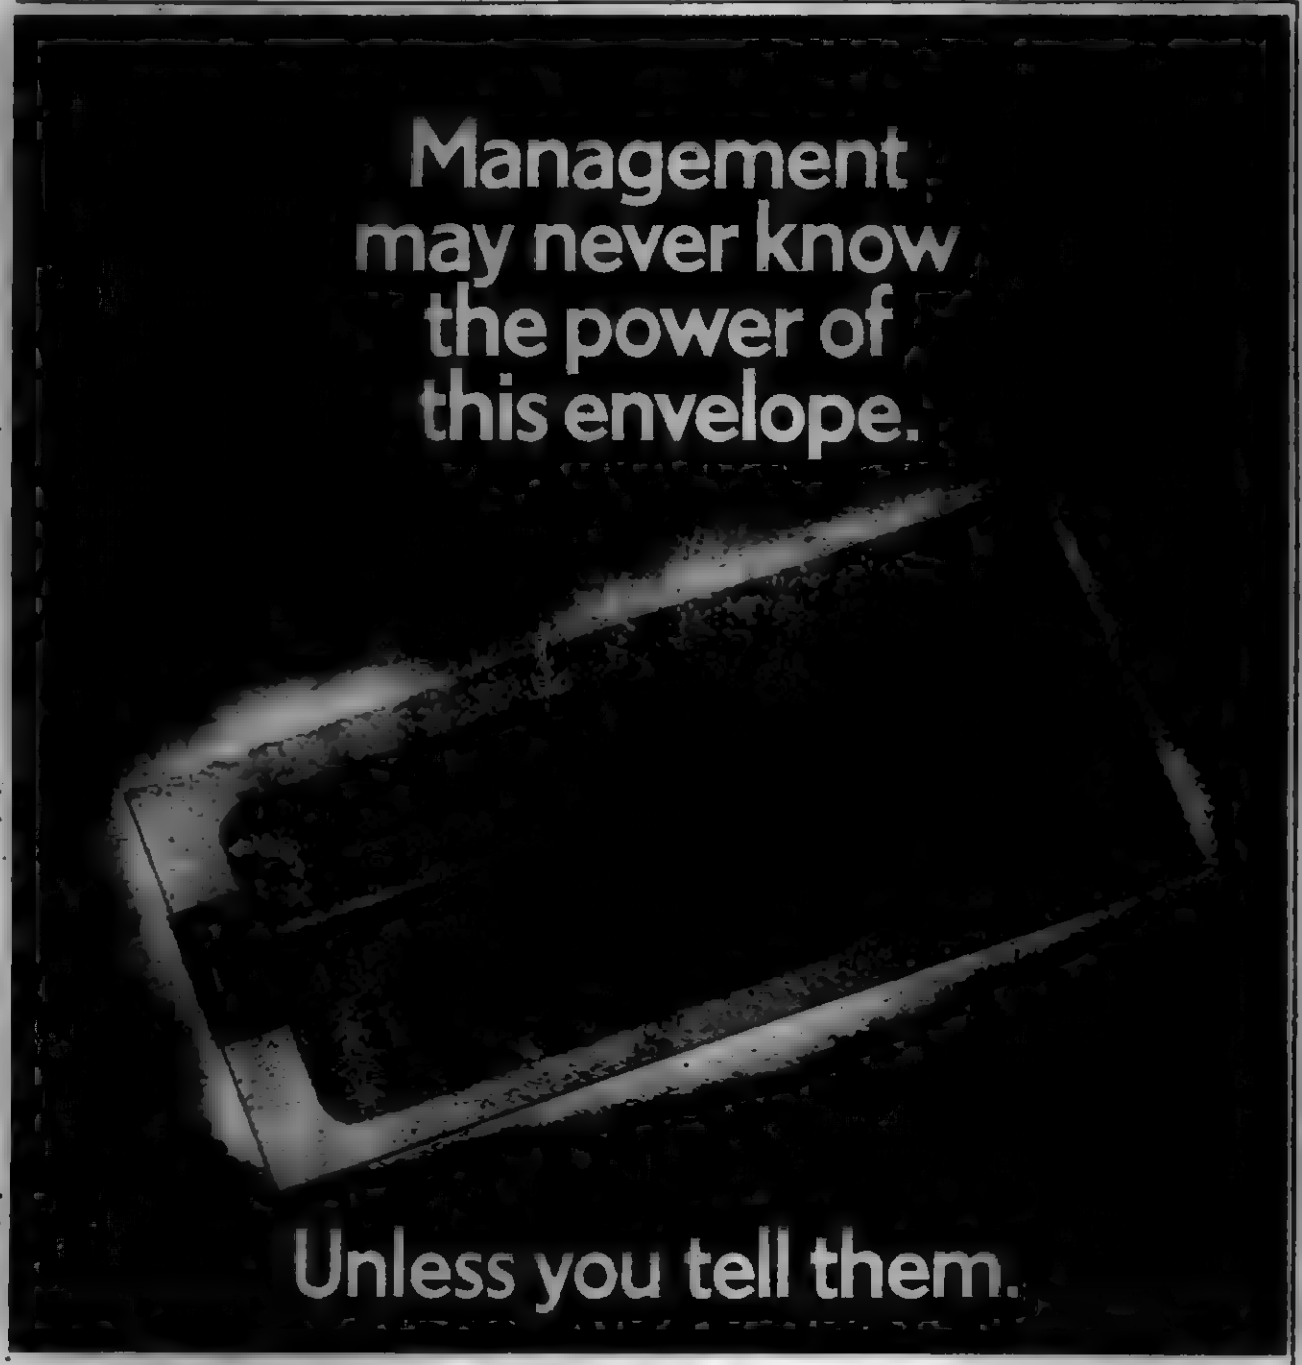
5. The model should be flexible enough to accommodate system growth over a wide range without requiring significant system retuning or load balancing, or rebuilding or otherwise changing the application system. In other words, the model must view all system components as symmetrical resources so that expansion can be reduced to adding more such resources.

6. The model must support an easy-to-use screen form interface for user data input and output, complemented by an extensive on-line "help" facility. This feature allows the application system to be more user-friendly, especially to users with no data processing background. Training requirements and operating staff resistance are thus significantly reduced.

7. The model must also minimize the overhead of accessing the data base and the user interface so that acceptable response times and overall system throughput can be achieved. Trade-offs that jeopardize data base integrity, system availability or security are unacceptable. In addition, access to these vital system facilities must be easy to program and a "natural" extension to the programming languages used.

8. The model should be built around a centralized dictionary to enhance further the integrity of the system. The idea is to catalog all data dependencies and avoid data inconsistencies, multiple data definitions and general duplication and redundancy. Such issues apply not only to user data but to system data as well.

9. The three definitions of "transaction" have arisen because of the importance of all three concepts to on-line transaction processing. The model should thus reflect an application structure that formally accommodates application units (to reflect the end user's concept of a "transaction work unit"), screen message pairs (to reflect the operator's "transaction interactions" with the system) and data base transactions. While these three concepts sometimes coincide for a given application, they generally do not. So the model should not arbitrarily force any common boundaries for the three basic constructs. The model should also lend itself to the implementation of small, modular, dialogue-oriented programs (see Figure 1 on ID/32).



You don't have to tell management how easy it is to implement "E-COM" service. That can be your secret. Tell them instead about the power of an E-COM service mailing. How letters can be sent right from the company computer. How the Postal Service prints, folds, inserts, seals and delivers these letters for you. How the distinctive blue envelopes of E-COM service lend visibility and impact to your mailing.

Since you're the one who gets E-COM service up and running, you have three options—all of them easy. First, you can write the system interface yourself. It takes about a day, and Postal Service consultants are standing by to give you any help you need. Second, you can buy a dedicated interface from a third-party vendor. Third, you can access E-COM service through an independent communications carrier, without bringing the system in-house at all.

As part of the D.P. department, you're in a unique position to tell your management about the power of E-COM service. So find out more. Send us the coupon you see here. You may never again get so much credit for so little work.

*Electronic Computer Originated Mail

E·COM
DELIVERS IMPACT.

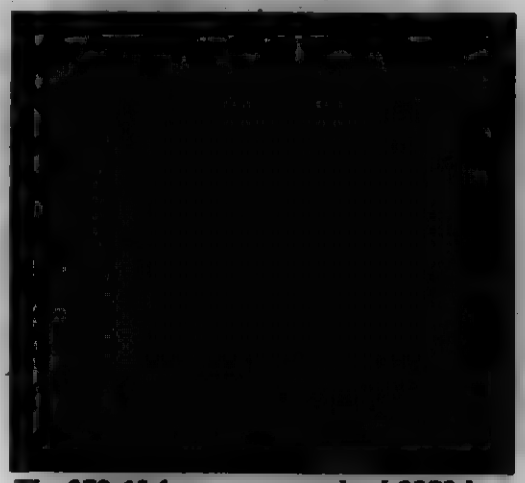
A Simple Plug For Datastream's New 5-in-1 Remote 3278 Terminal.

Anyway you look at it, the Datastream 878-15 is an extraordinary 3278 display station.

Look first at versatility. The 878-15 supports five screen sizes. IBM® 3278 Models 2 through 5. Plus DEC® VT100. So you can access any 3270 or minicomputer application from a single display station.

And all five screen sizes can be selected by the host. Or menu-selected by the operator.

Then take a look at the 878-15's sophisticated keyboard. It delivers complete 3278 functionality. And advanced 3290 features like 24 top row PF keys, an operator-definable 10-key pad and more. The 878-15 even offers a port for direct printer attachment.



The 878-15 features a standard 3278 keyboard plus 24 PF keys and an integral 10-key numeric pad. The 14" screen is available in green or amber phosphors.

And that brings us to the simple plug.

The 878-15 is designed for use with Datastream's BSC or SNA Remote Cluster Controllers, which allow the 878-15 to access its host or hosts over ordinary phone lines. All you have to do is plug it into a modem and dial in. Or connect it directly to the controller. Either way, you'll never see the expense of leased lines again.

Together, 878-15 and 178-2 Display Stations and our Remote Cluster Controllers make quite a team.

Offering advantages like sophisticated security. Remote diagnostics. Multiple concurrent sessions. Dual IBM host access. Minicomputer access. And communication with other peripheral devices.

If you're looking for flexible, reliable and inexpensive ways to extend your 3270 network, Datastream Display Stations and Remote Cluster Controllers are well worth looking into.

Call or write today. Datastream, 2520 Mission College Blvd., Santa Clara, CA 95050. (408) 986-8022. Outside CA, CALL TOLL FREE: 800-952-2500.

TotalCare

250 NATIONWIDE SERVICE LOCATIONS

TotalCare

TELEMAINTENANCE – REMOTE SUPPORT

TotalCare

How you can offer your customers a service program that's as good as your product.

Honeywell's nationwide service organization is now available to other companies.

We call it TotalCare™ Third-Party Service. Honeywell will tailor a service program to meet your requirements. You can select from a wide variety of service options. With more than 250 service locations around the country, we're well able to look after your customers' satisfaction.

If your business is in digital switches, modems, multiplexers, voice/data terminals, or local area networks and you're having trouble providing quality service or are dissatisfied with your current service alternatives – call Honeywell.

A quality approach to service.

We'll give you the benefit of an organization dedicated to providing first class service. Flexible service. Nationwide. At a price you'll find very reasonable.

For more information on how Honeywell can help you better serve your customers, stop by the Honeywell booth at Interface '84 (#1628) or call 800-328-5111, ext. 2717. (In Minnesota call 612-870-2142, ext. 2717.) TotalCare™ Third-Party Service, Honeywell, Telemarketing Center (MN12-4118), Honeywell Plaza, Minneapolis, MN 55408.

Together, we can find the answers.

Honeywell

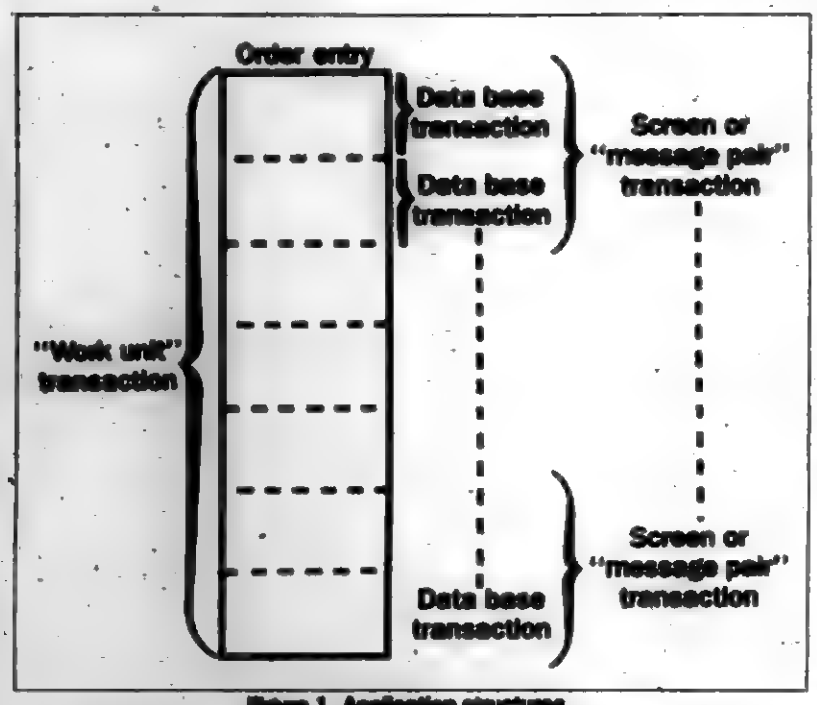

Figure 1. Application structures

10. The model should support a multisession user environment. Such sessions have the same system protection and isolation requirements, although the same set of system facilities should be made accessible to all sessions. The model should further support an interrupt/resume capability to allow a user to interrupt his current activity temporarily, perform another activity, then resume the original activity at the point of interrupt. This versatile user environment must be fully supported by the model's recovery mechanisms.

11. The model should support on-line system management and administration. It is unacceptable for an on-line transaction processing system to be unavailable while such operations as system configuration, tuning, load balancing or monitoring are in progress. In addition, those operations should not require significant effort, talent or expertise.

12. The model should support a general "system notification and reporting" facility to be used by all system components to report their status and other abnormal conditions to the system operators by name rather than by terminal. And such messages must be guaranteed safeguard by the model across system failures. In other words, they need to be part of the recoverable system data base.

13. On-line transaction processing systems generally have many remote sites with remote devices managed by remote system administrators. The environment must therefore support such notions of multiple managers with specific local responsibilities. This necessity must not affect the primary system administrator's duties.

14. The model must support asynchronous and batch processing facilities. These facilities must support the more traditional batch processing environment and also be accessible from the on-line environment so that the short, quick-turnaround but noninteractive spin-off transactions can be easily submitted and processed as background activities.

The batch facility should use the system notification and reporting mechanism to notify the submitter when these background activities are completed, especially since many of the sensitive system administration functions may in fact be performed asynchronously, as in the case of global password changes.

15. Notwithstanding all the above requirements, the environment must be conducive to easy application development and testing to allow application system implementers to complete projects promptly. This development environment should take advantage of the model's security mechanisms and be able to coexist with the production environment without any risk of contaminating it in any way.

Prevailing models

Many computer and software vendors have tried to solve the generic on-line transaction processing problem in a variety of ways. However, all successful attempts to date have implemented their solutions by starting with a multiprocessing, multitasking operating system and building a DBMS and a transaction processing manager on top of the operating system. These additions usually execute at the application software level, although most have been implemented as "privileged" user-level software.

Such solutions have been the easiest and quickest to implement and have managed to fill much of the vacuum in this marketplace. However, in most cases they have been the only possible way to build an on-line transaction processing system without a full redesign of the basic operating system.

Some vendors have gone further and modified their operating systems to accommodate some of the unique requirements of this on-line environment. Compatibility with user software developed by their existing customers has, however, significantly restricted the amount of

"We're saving $50,000 a year by eliminating SYSOUT printouts and installing JCLWTR."

That's the word from one user of AID's new JCLWTR system.

Instead of printing every production SYSOUT listing, JCLWTR stores them on disk where they're instantly accessible through special SPF screens or hard copy printouts.

The savings in paper, printing, handling, and storage costs add up so quickly that even medium and small shops can recover the system's minimal cost in just months.

JCLWTR installs on medium and large IBM systems operating under MVS and supports on-line interfaces to COM.

Find out how much you can save with AID's JCLWTR system. Send in the coupon, or call Lew Kabza at 312/654-3030.

WE WROTE THE BOOK ON DOCUMENTATION. AND THEN WE THREW IT AWAY.

Communication Sciences Introduces Explain. The system that puts your software documentation where you need it most—online and in your data base.

With Explain, you can create online user help, training procedures, program documentation and more. Because Explain uses the power of your DBMS, you can maintain the documentation as easily as you do the rest of your business data.

Access to the online documentation is at the user's fingertips. With simple commands, users can retrieve the help they need—directly from any application you link to Explain.

Chosen by Comserv Corporation as the online help system for AMAPS/3000, Explain is a powerful tool for both writers and readers of software documentation. And it's available to users of HP/3000/Image and IBM series 30xx and 43xx systems.

With Explain, you can afford to throw the books away. And keep the documentation.

For more information: call us at (612) 332-7559, or write to Communication Sciences, Inc., 100 North Seventh Street, Minneapolis, MN 55403.

operating system tailoring they could do.

Operating systems generally manage all system resources. They typically consist of device and communications handlers, a file manager, a process manager, a memory manager and a command processor. In addition, various utilities and programs are provided for performing specific jobs, like compilers, linkers, editors and so on.

In most operating systems, the unit of work is the "process." This entity is the one that preserves the state and context necessary to execute programs in the system at all times. The operating system schedules and dispatches processes for execution depending on a combination of conditions such as the resources needed by the process to execute, operating system scheduling policies and process priority, level of interactivity and so on.

Requester-server model

Because most operating systems have been implemented on general-purpose computers, they tend to be general-purpose, attempting to be all things to all people. Some have stressed more real-time or batch processing support, others have emphasized time-sharing facilities. None, however, has been designed with on-line transaction processing as its primary execution environment.

As a result, the addition of DBMS or transaction processing manager capabilities has invariably been in the form of dedicated processes to perform these functions. Most systems that support on-line transaction processing use the "requester-server" model (see Figure 2).

The basic premise of this model is that the terminal environment is handled by the transaction processing manager, usually implemented as a terminal control process, termed the "requester," while the application processing is done in the contexts of a set of processes called the "servers."

The DBMS runs as a separate process and is the only one that can access the data base. The servers communicate with the requester transaction processing manager and DBMS processes via an "interprocess" message mechanism. The requester normally sends messages to the servers indicating to them what they are supposed to process, and the operating system takes on the responsibility of delivering these messages to the servers and scheduling them as a result.

Requester-server limitations

Transaction throughput: This model serves many of the purposes of the small on-line transaction processing environment but is seriously deficient as the number of system users grows. Even if we were to assume an infinitely powerful processor so that we can ignore for the moment the limitations of the hardware, the situation is still one in which all the terminals are controlled by *one* process, and the data base is managed by *one* process.

These two processes quickly become serious bottlenecks in the system. Attempting to solve this problem by dividing the labor among more than one process of each type introduces a set of even more serious problems.

On the terminals side, the transaction processing manager processes are each given a number of terminals to control. This allocation is normally done at system generation time and works fine for as long as the work-load distribution is uniform among the terminals. Since this distribution is usually hard to predict and tends to vary significantly over time, the result is often a return to the original transaction processing manager throttling effect, or an acute load-balancing problem in which the installation manager is forever playing catch-up.

On the data base side, the DBMS processes must compete for access to the disk and the data base, requiring a new level of concurrency control, which can only be handled by the operating system itself in a way it is not used to, given its general-purpose/time-sharing design biases.

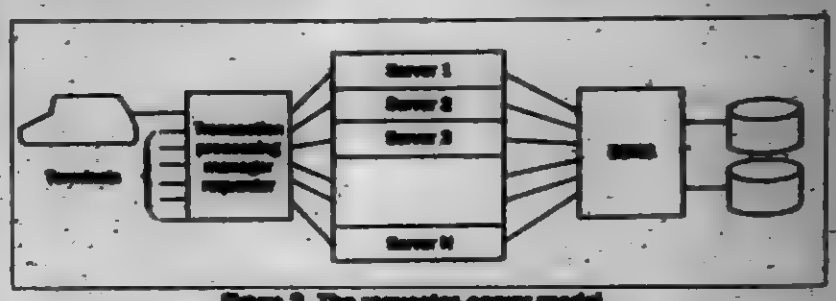

Figure 2. The requester-server model

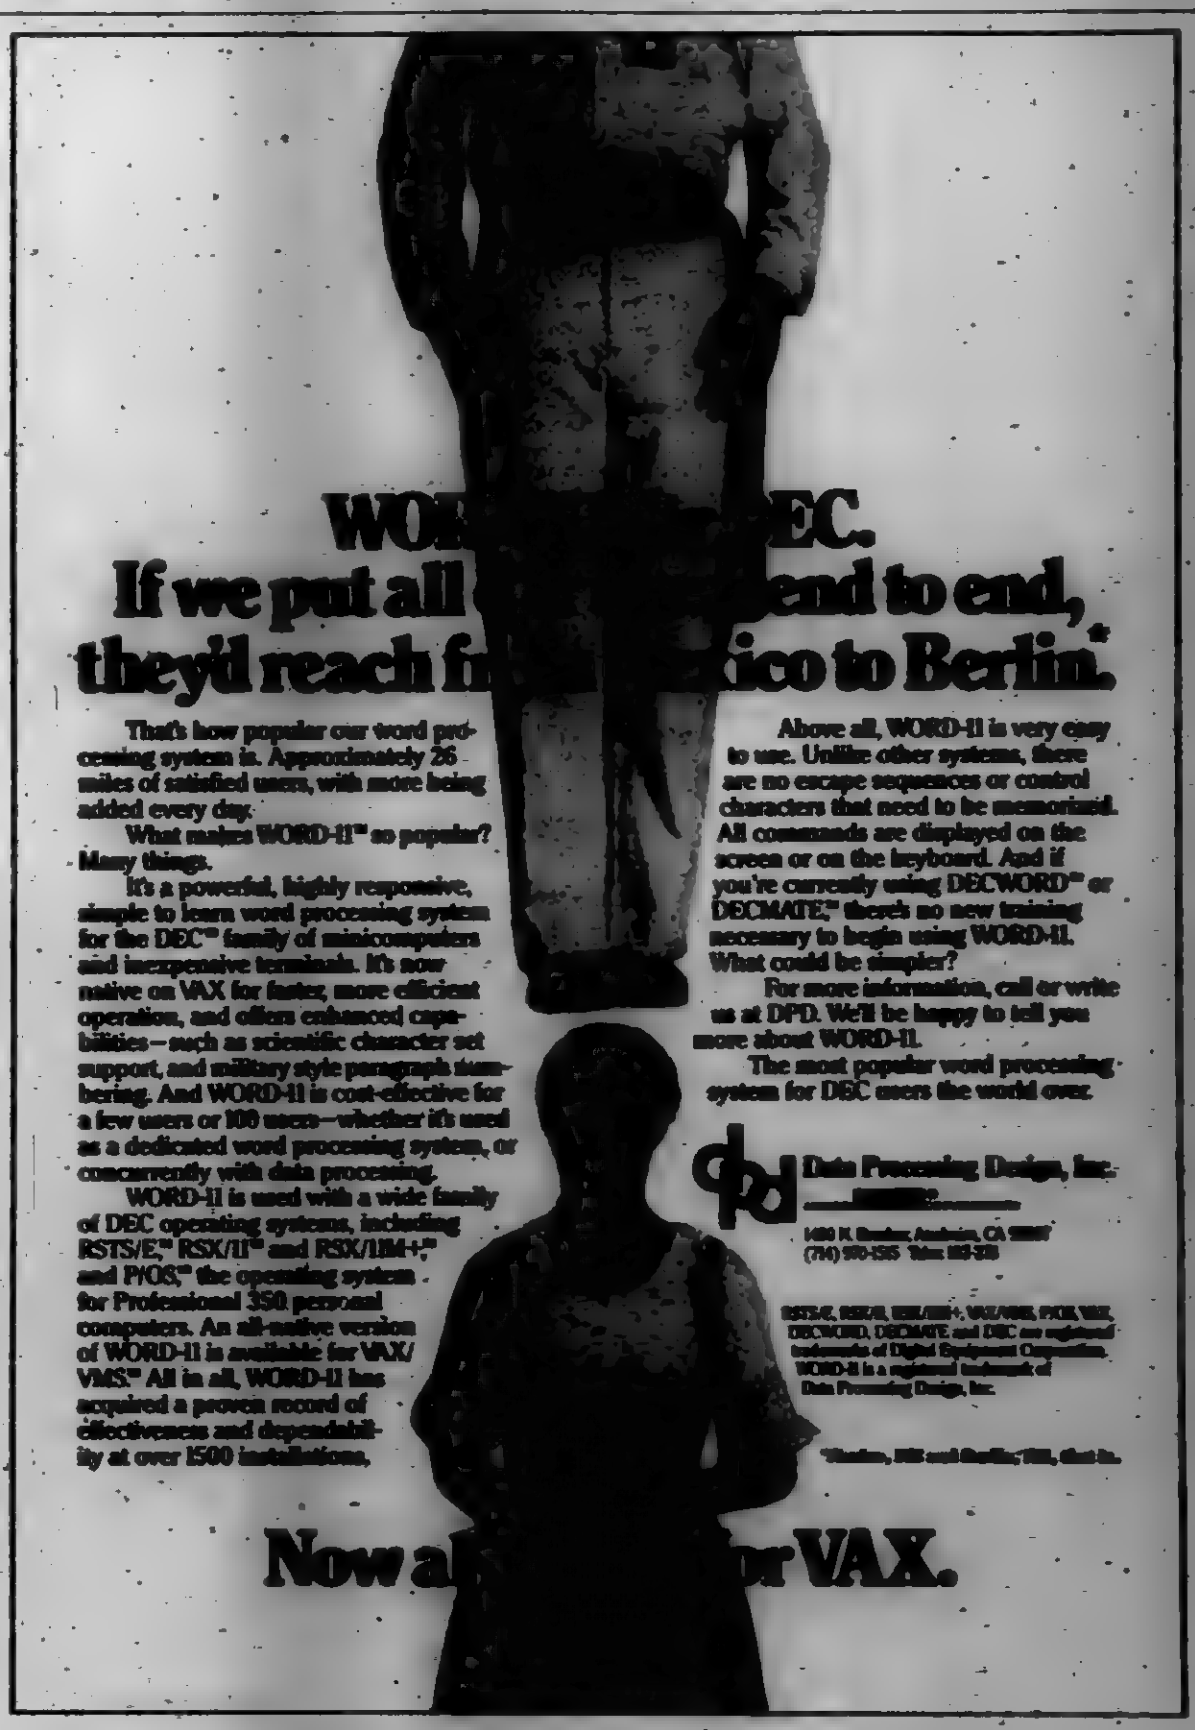
Some systems have attempted to reduce the concurrency issues by segmenting the data base among the DBMS processes. The result is another level of control that knows how the data base is segmented, or more crosstalk between the DBMS processes when they receive requests they cannot handle themselves because of the segmentation. This solution also suffers from load-balancing effects as in the case of terminal segmentation already mentioned.

These problems are compounded many times over in real life when it comes to dealing with more finite processors and the resulting break-up of the ideal large system into



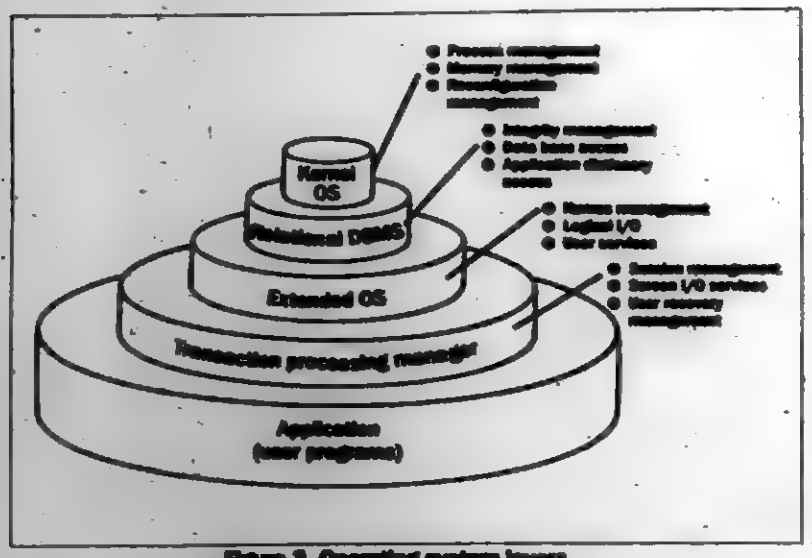


Figure 3. Operating system layers

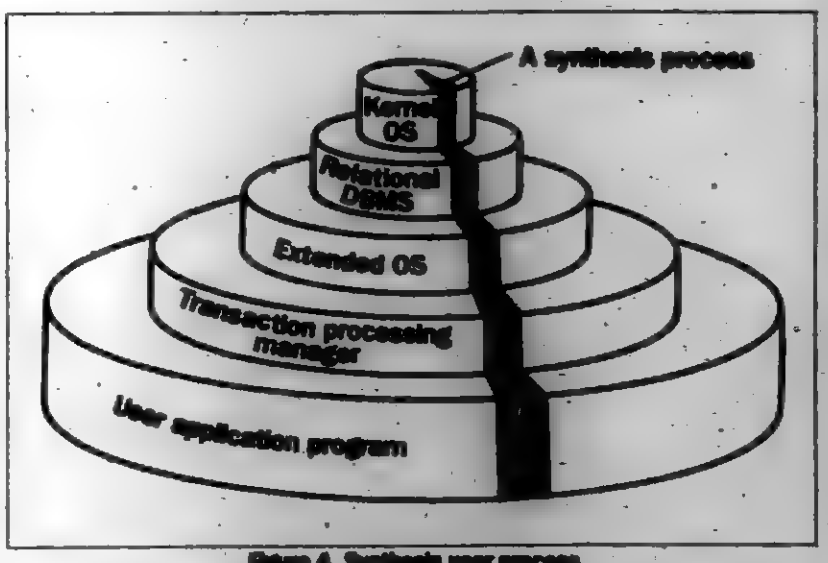

Figure 4. Synthesis user process

many smaller systems. They are then usually tied by high-speed buses of communications links. As more processing modules are added, the incremental cross-talk overhead starts to overshadow the increased net processing power of the system, and the system rapidly saturates.

User isolation and security: User isolation and protection are handled very efficiently by the traditional operating system when they are only required at process boundaries. Further protection above that must be handled by the application-level programs, in this case the DBMS and the transaction processing manager. That situation adds to their processing overhead and, more importantly, disperses the controls on isolation and protection, leaving the system more vulnerable to both accidental and malicious violations.

Application recovery: Distributing the processing done on behalf of a user among more than one process suffers from the further disadvantage of having to synchronize the processing to achieve a single point in time when both the user data base and the application state can *together* be declared consistent. This synchronization is hard to perform because it works against the operating system notion that all user processes are essentially independent, and issues that normally would only be addressed when designing distributed data bases now need to be solved within the confines of the one local system.

New approach to problem

The preceding analysis identifies many of the problems that Synapse Computer Corp. felt were typical of existing on-line transaction processing systems. These problems can be summarized by the statement that the generic requirements of such a system are, in many ways, in conflict with the traditional operating system architectures.

When given the opportunity to start from scratch, however, it is fairly straightforward to build a model that can satisfy these requirements, without affecting any existing customer base. This model is the one Synapse has selected to design and build the Synthesis software for its Synapse N+1 Transaction Processing System.

Operating software

The operating software is packaged as a ring-like architecture, in which the various components are implemented as rings, or spheres, with decreasing privileges from the inner to the outer rings.

At the heart of the software system is a kernel, responsible for memory management, a low-level file system, all device handling and process scheduling. The next layer above is the DBMS, which manages all access to the data base. Concurrency is therefore controlled at the lowest possible level in the system, and all other system layers can thus take advantage of the data base facilities.

The next layer is an "extended services" layer, responsible for the named object system, logical I/O operations and so on.

The top layer in the system is the transaction processing manager, responsible for all screen form processing, application management restartability and the user interface. Each of these system layers consists of a "code" segment and a "data" segment to maintain all static and global data that this layer manages (see Figure 3).

The server-per-terminal model

In this model, a user server process is created for each terminal (see Figure 4). All code within the operating software executes as a set of "privileged subroutines" of the user process. As a call is made to one of

VMSCHEDULE

"VMSCHEDULE has reduced our prime-time workload by 30%."

VMSCHEDULE—A complete scheduling package for end users and management.

- Optimizes machine use by running scheduled resource-intensive events during off-prime hours
- Saves systems personnel time by automatically running repetitive operations without intervention or initiation
- Automatically reschedules events when the machine has been down
- Provides optional load balancing features
- Uses simple English subcommands
- Allows concurrent operations by several users
- Increases security by verifying passwords
- Requires no mods to CP or CMS

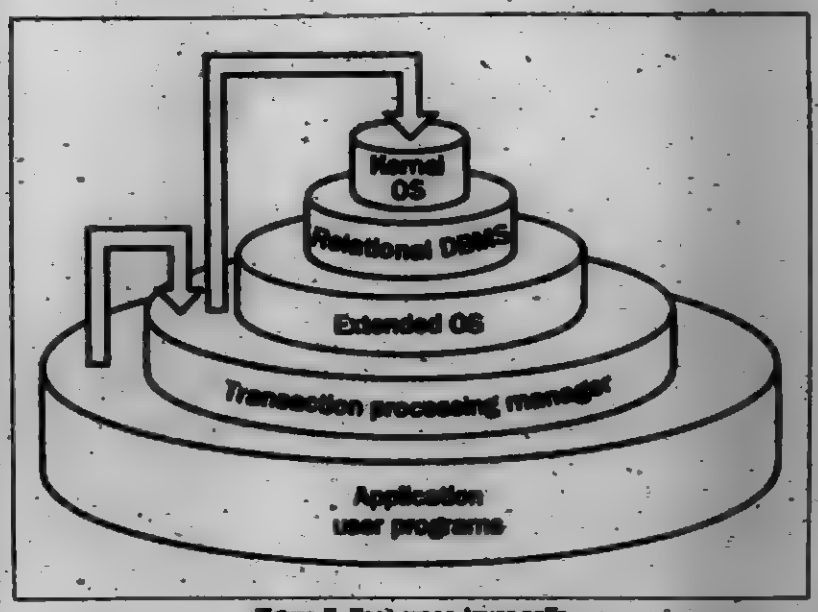

Figure 5. Fast cross-layer calls

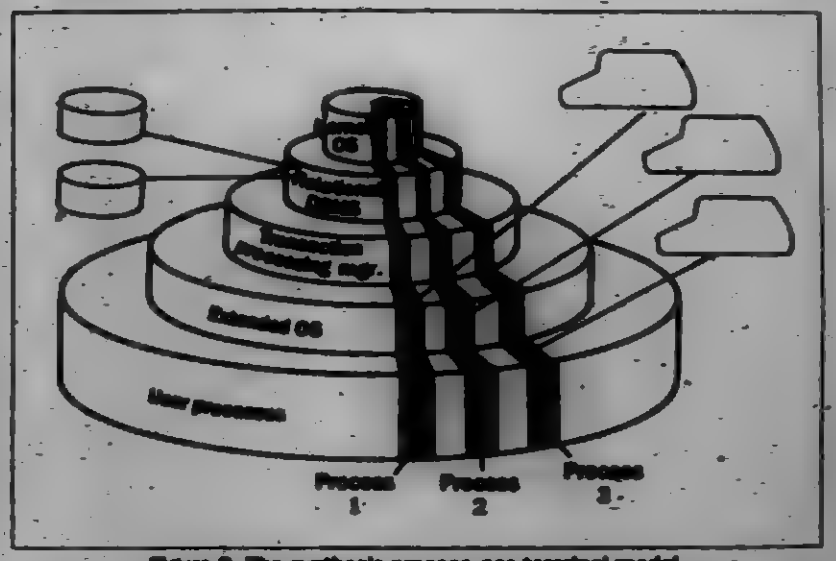

Figure 6. The synthesis process-per-terminal model

those subroutines, the process enters a state in which it can execute any code in that layer (see Figure 5). Only through this code can it access any of the data in that layer's data segment. On exit from the system layer, this access privilege is again revoked.

This expansion and contraction of privileges is most easily achieved by manipulating bits in hardware registers which make up the system's memory management unit. As a result, these system calls, and, in particular, "communications" with the DBMS and transaction processing manager, take a few microseconds, as opposed to the several milliseconds typical of interprocess message communications (see Figure 6). Since the bulk of the system overhead in the typical on-line transaction processing environment is directly related to data base and screen form access, the result is significant increase in overall transaction throughput.

The security model

Since each user's applications are being processed by a separate process, all traditionally efficient kernel protection and isolation mechanisms can be used to their optimum, without the need for additional protection mechanisms at the DBMS or transaction processing manager level, except for logical locks on the data base records as dictated by the transaction model (DBMS) and front-end user security checks (transaction processing manager).

To further enhance this model, optional controls can be placed on specific objects in the system, such as files, data base tables, screen forms, batch queues, programs, application units and so on. These allow the installation manager to restrict access to these objects to one or more users or groups of users. Moreover, these restrictions may be total (users have no access at all to the specified object) or partial (they may only be allowed certain modes of access; for example, read but no update or delete access).

The transaction model

User programs access the data base by calling into the DBMS layer but without undergoing any process context switching. As a result, data base files, or "tables," as they are more commonly called in a relational system, and/or data base records, or "tuples," can be "locked" by a shared or an exclusive lock, depending on whether the access intent was for inquiry only or update too. These locks and the ensuing inquiries and updates are all part of that user's "transaction."

This transaction remains open until it is "committed," in which case all changes to the data base become permanent or "rolled back," in which case all such changes are backed out of the data base. In either case, the locks are all dropped as soon as the transaction terminates.

This transaction model absolutely guarantees data consistency and is backed up by a sophisticated recovery mechanism, which itself is based on the transaction model. Thus, the model can also guarantee data integrity across system failures, even those that occur while the recovery process itself is in progress.

The application model

The application model takes advantage of the server-per-terminal, security and transaction models to fulfill all the requirements for on-line transaction processing.

User processes are created by the transaction processing manager. Before users are allowed access to the system, the manager validates their passwords and further controls their access, through a tightly bound menu tree, to one of a specified set of "application units" (see Figure 7).

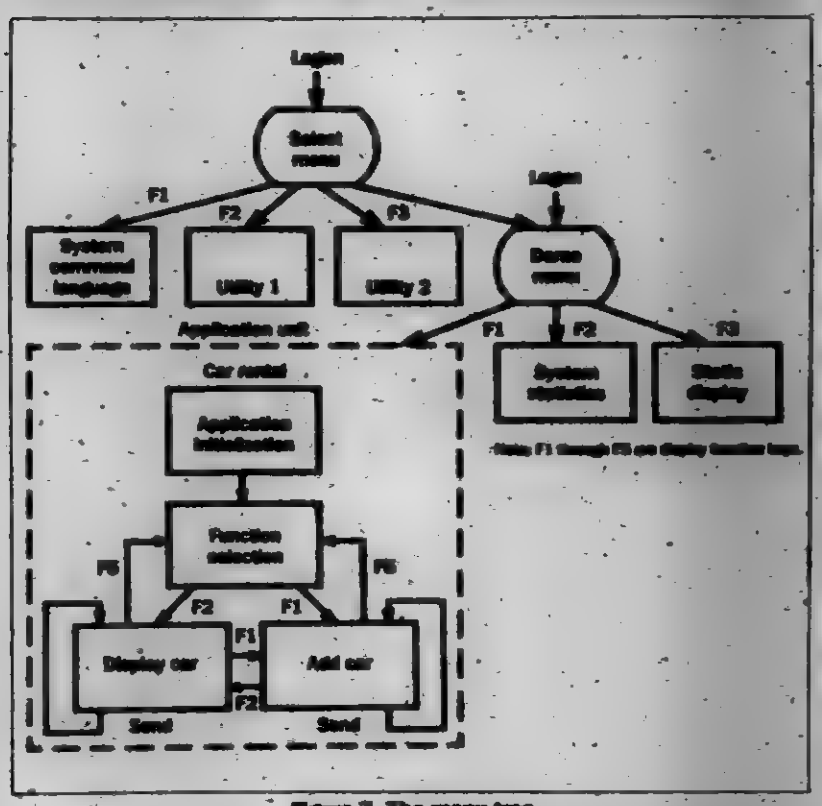

Figure 7. The menu tree

Better letters.

Dataproducts Daisywheel Printers

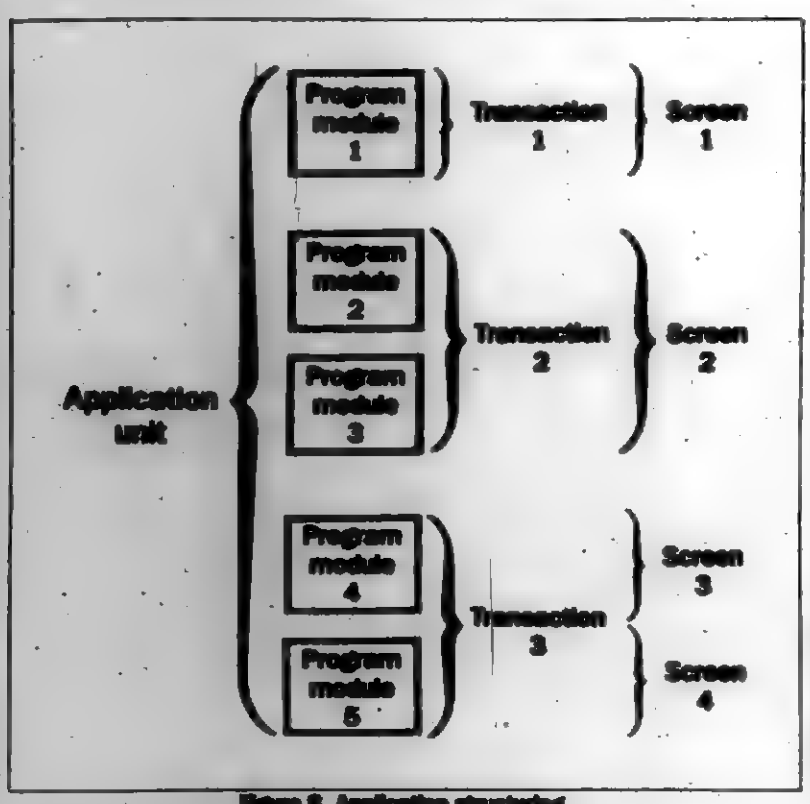

Figure 8. Application structuring

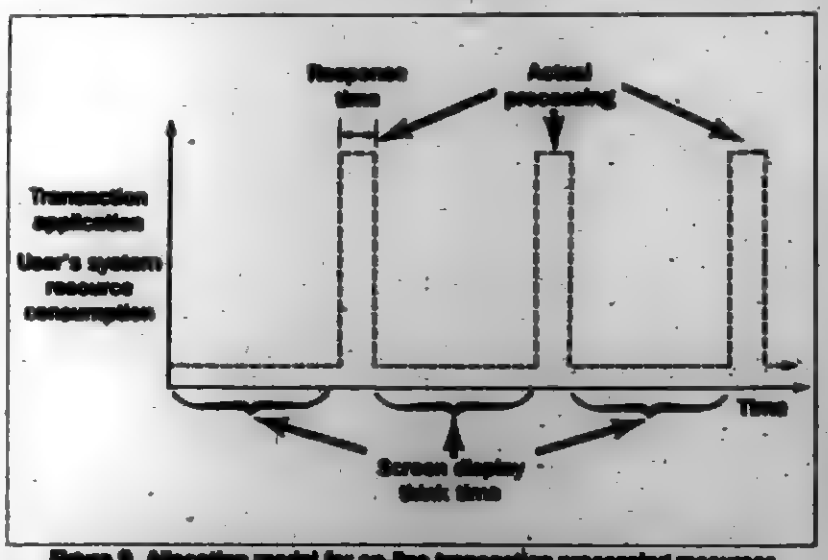

Figure 9. Allocation model for on-line transaction processing resources

These application units are made up of a number of processing steps, each of which is a separate executable program (see Figure 8). These programs are tightly bound together and to all the data base tables and screen forms that they reference. All further access to other tables, forms or programs is denied by the system. This binding occurs at application unit build time, which is a postlink "application installation" step in the development process.

Binding also improves runtime performance by resolving in advance all named references to internal system identifiers. It further enhances the application integrity by cataloging all its components in the system's application dictionary and enhances its security by providing complete containment of all the objects that the application unit programs are allowed to access.

Programs nominate their successors to the transaction processing manager via a direct "invoke" call. Options on that call can specify that one or more screen forms be displayed and/or that this interprogram point be declared an application restart point.

During the interprogram interval, only the data in the screen form buffers and an optional parallel set of nondisplay or "transfer" buffers are kept; all other application program code and working storage memory are reclaimed by the operating system (see Figure 9). Since at this point, typically, screen forms are displayed, no memory resources are wasted during that long display or "think" time. The model takes advantage of this long think time to achieve the multiplexing effect outlined earlier in this article. As a by-product of this model, application program code and data do not need to be swapped out, since they are not going to be reloaded at completion of input. Rather, the successor program specified by the "invoking" one will be loaded instead.

If the "invoke" point is declared as an application restart point, the transaction processing manager saves all the information needed to "invoke" the new program, along with the contents of the declared screen forms and transfer buffers in a set of internal data base tables, then "commits" these updates to the data base. If the application program has not independently committed its own data base updates, then the transaction processing manager's action commits both sets of updates because they all happen within the same process's context.

The result is simple and straightforward: Once the transaction is committed, any system failure causes all further data base updates, whether initiated by the transaction processing manager or the user, to be rolled back. As a result, both the application's data base and its program state, which is in the transaction processing manager's data base, are restored to their state at the previous such "application restart" or commit point. Full application restartability is thus achieved without one line of recovery code at the application level. For this model to be complete, the entry point to and the exit point from an application unit are automatic restart points.

To maintain full model flexibility, the "invoke" facility, along with all its options, is itself optional. Screen forms can be displayed "in-line," and data base commits can be independently requested of the DBMS by the application programs.

In the former case, the more traditional program swapping occurs; in the latter, the user program takes on the responsibility of synchronizing its application state with its data base state.

Implications for architecture

We have presented the generic on-line transaction processing problem, with its major characteristics and their influence on a new model for such systems. Our experience with this new model has been to observe a significant acceleration in the design and development process. We have also observed a decrease in the daily operational complexities normally encountered in production applications.

Our discussion has not been dependent on any specific hardware architecture. The relevance of hardware architecture is to optimize transaction throughput. We believe the 1980s will see the emergence of significant new advances in fault-tolerant architectures, which will be designed to facilitate high-transaction throughput for on-line transaction processing models. Whatever architectures emerge, however, the choice of a proper model will still determine the aptness of the system for design, maintenance and operation of on-line transaction applications.

About the authors

As on-line transaction processing group leader for Synapse Computer Corp. in Milpitas, Calif., Wagaih Boctor was the architect of its "OLTP transaction model." He recently was named manager of systems support.

Ken Cohen, currently the product line manager, previously worked in development with Boctor and was a major contributor to the product-specification effort.

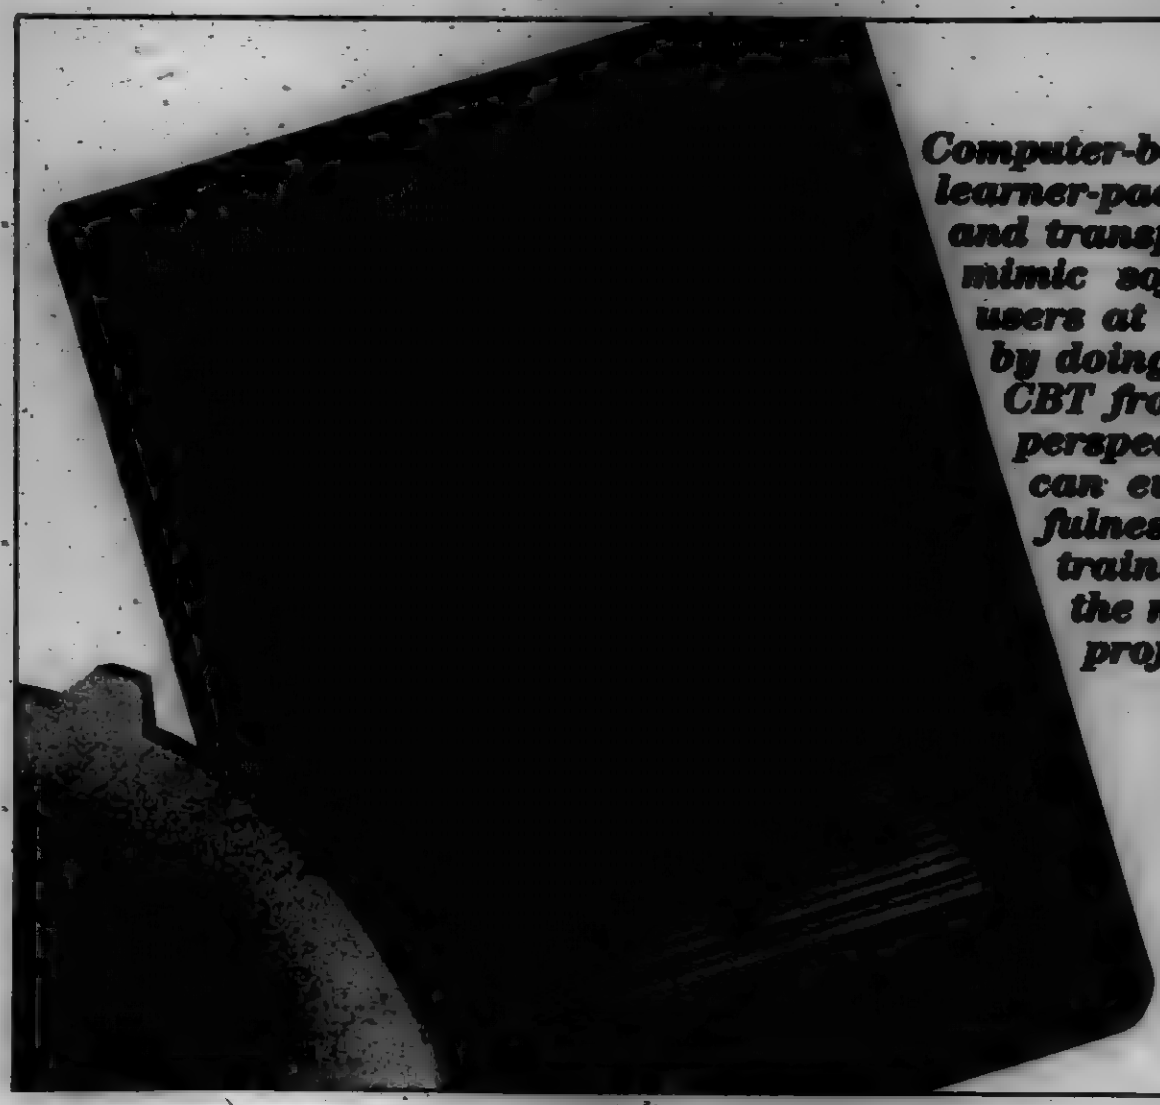
IN DEPTH



Computer-based training is learner-paced, adaptable and transportable. It can mimic software so that users at any level learn by doing. By looking at CBT from a designer's perspective, managers can evaluate its usefulness for their own training as well as the needs of non-DP professionals.

Computer-based courses: Not all are created equal

By Carol Kowle Anderson

Training in fourth-generation languages is not the exclusive domain of the information center and its end-user audience. The growing use of software packages for data entry and report writing has created a demand for training that meets a variety of needs, including those of the DP manager.

Changes in application development processes have increased the use of software such as Information Builders, Inc.'s Focus or SAS Institute, Inc.'s SAS in traditional DP applications. The DP manager may direct staff in the use of such software or run an information center to assist end users.

Computer-based training (CBT) is an effective means of meeting the demand for instruction in fourth-generation languages. CBT also covers such subject areas as DP management development, concepts and programming languages and project design and development. It is transportable to remote locations, self-paced and adaptable to a variety of instructional needs.

In addition, CBT can mimic the actual software so that learners at any level learn by doing. All of these features make computer-based instruction on SAS, Focus and similar packages an ideal training choice on the part of the DP manager.

Expenditures growing

Based on a recent survey, the market research firm of Talmis in Oak Park, Ill., projects that company expenditures for CBT will grow from $165 million in 1983 to $500 million by 1987, an increase of more than 200% in four years. These statistics include the cost of custom-developed CBT for micros, microcomputer courseware in the retail market and all mainframe CBT.

Usage figures for CBT materials produced by Deltak, Inc. support the survey findings. Deltak customers installed 128 courses under the Phoenix operating system in May 1983. By October, customers had installed 2,700 courses. Goal Systems, Inc., developer of the Phoenix CBT operating system, has also reported tremendous growth in installations during the past year.

By looking at computer-based instruction from a design perspective, DP managers can evaluate its usefulness both for their own training and the needs of non-DP professionals.

The first major concern is whether the CBT offers the amount of information the student needs to become a competent user of the language or program. The second consideration is how appropriate the courseware is for an installation and whether that courseware represents the current release of the software or system.

Computer-based instruction should be selective regarding the amount of material covered. It should teach the body of knowledge needed by an average user, whether it is 30%, 50% or 80% of the actual software. A CBT course that attempts to teach every aspect of a software program in a few hours is no better than a user's manual.

This point may seem obvious, but excessive competition among CBT developers has resulted in the rapid production of courses that sometimes merely translate the user's manual into on-line text. In fact, basic-level CBT courseware need not cover more than 50% of a particular software package, regardless of whether the audience consists of DP staff or end users.

For most fourth-generation languages, the CBT only needs to cover the basics of information retrieval, data editing and report writing, if appropriate. Advanced features and additional options are not necessary, at least not in introductory, hands-on courses. CBT that covers the most widely used features of a software package has the advantage of reaching a broad audience within the company. Such training can be more cost-effective because it meets the needs of diverse groups.

For example, IBM's ISPF was designed as a programmer productivity tool but is becoming a popular editor in many installations. Programmers and end users alike employ ISPF to create, edit, move, copy and print data. It makes sense that a CBT course on ISPF would devote more instruction to the editing skills needed by a broad range of users than to technical options used by a single department. Both CRWTH Computer Courseware and Deltak courses on ISPF devote about 100 minutes to the subject of editing, although the structure and approach of the two are quite different.

In terms of the appropriateness and currency of CBT courseware, DP managers need to evaluate whether the content meets their own needs and the needs of other users at their installation. Well-planned CBT will reflect the most recent release level of the software, even if it requires the CBT development firm to upgrade existing courseware.

This issue is more complicated than it appears on the surface. For example, Pansophic Systems, Inc.'s Easytrieve is available in batch and interactive versions — the CBT may reflect only one of these. ISPF is an upgraded version of MVS/SPF — yet some available CBT covers the old SPF version. If an installation is running ISPF under IBM's VM/SP operating system, the CBT must be VM-based.

Computer-based instruction should be selective regarding the amount of material covered. A CBT course that attempts to teach every aspect of a software program in a few hours is no better than a user's manual.

Since most popular software is enhanced on a regular basis, DP managers should be alert to new releases that reflect major changes. Of course, each installation may want to tailor training to local standards, but it is important for CBT to be current.

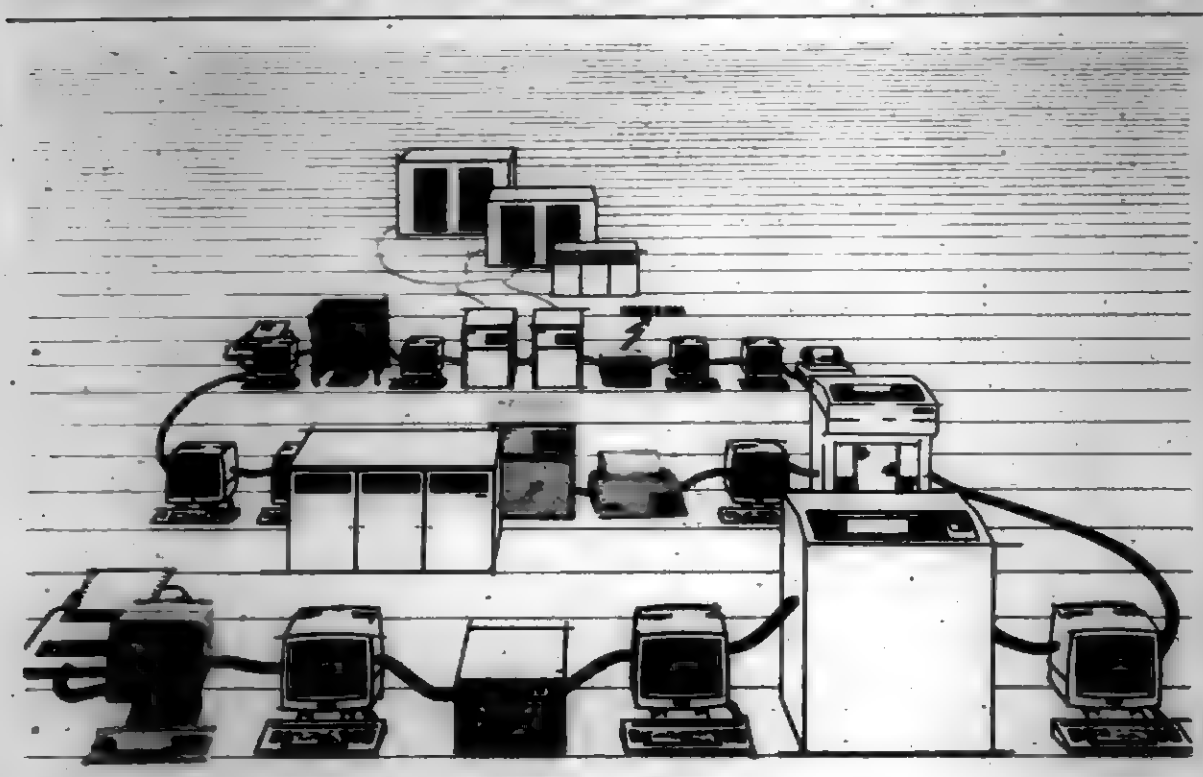
Established training firms usually survey their customers before they develop CBT. As a result, their CBT will most likely respond to identified training needs as well as represent the most recent release of a product. CBT developed under these circumstances will clearly state the nature of the content, the intended audience and the release level. Such introductions usually appear in the on-line courseware but may also appear in supplemental print materials.

What is the approach?

Because fourth-generation languages are so widely used, related CBT should apply to a broad-based audience. A successful CBT approach will be flexible and modular to accommodate the instructional needs of individual users. Other important considerations in evaluating the approach of CBT include the length of instructional units, the sequence of the material and the amount of on-line instruction vs. printed text. Finally, CBT on fourth-generation languages should emphasize practical applications of concepts wherever possible.

CBT can be more cost-effective if the training is useful to more than one audience within a company. Courseware designed for the information center does not necessarily exclude the applications development staff, especially where fourth-generation languages are concerned.

CBT courseware on fourth-generation languages by ASI, Inc., CRWTH, IBI, Deltak and other training vendors is usually designed with the nontechnical end user as the primary audience. All such courseware, however, should have built-in flexibility, allowing students to select the course or topic of interest. More experienced technical staff may bypass introductory material and go on to more germane instruction, provided



3270 Networking: No More No Man's LAN.

Imagine. 3270 Processing. Integrated Personal Computing. Local Area Networking. And SNA Compatibility. In One System.

Imagine a system that successfully settles the uncharted territory of 3270 local networking—that "no man's LAN" of unlinked and unrealized potential.

Imagine a system that delivers the power of 3270 processing, and the flexibility to build two local area networks from a single controller. Imagine being able to attach up to 120 devices to that controller. Or attaching four distinct controllers—and multiple coaxial links of up to 10,000 feet each—to any of those LANs.

Imagine the economies of a system that handles that networking with standard 3270 coax. That requires no commitment to special architectures or non-standard LAN technologies. And that, thanks to a multi-drop, station-to-station design, can eliminate thousands of feet of new coax.

Of course, such a system would have SNA compatibility. But it would also have a set of capabilities to dramatically increase throughput, while reducing hardware and support cost in *any* environment. Capabilities like multi-host and multi-personality support, application and address switching, and system printing.

This system would have multi-user personal computing "built into" the network—allowing you to assign true 16-bit computing power, maintain overall MIS control and share expensive disks and printers.

Such a system would boast an intelligent display station that displays a mastery of ergonomic and aesthetic design. With multi-screen formats, anti-glare screen, low-profile keyboard, and a tilt-and-swivel pedestal with the smallest footprint in the industry. Such a system would also include a full line of printers.

Imagine. 3270 processing. IBM-compatible personal computing. Versatile, economical, powerful local area networking. In one system.

Braegen has imagined just such a system. They have designed it. Built it. And called it the ELAN™ System.

If such a system sparks your imagination, give us a call. We know the feeling. The Braegen Corporation, 525 Los Coches Street, Milpitas, CA 95035 (408) 945-8150; TWX: 910-338-7332

BRÆGEN

*ELAN is a trademark of The Braegen Corporation.

that the structure allows them to choose their own instructional plan.

CBT that breaks down into flexible units of instruction has many advantages for the learner. Material is manageable in terms of time and learning requirements. Learners are not overwhelmed with information; they can stop at a reasonable break in the instruction and resume when it is convenient.

Goal System's Phoenix and IBM's IIPS are two CBT operating systems that provide the student with a number of decision points during instruction. The ability to see and select from course and topic lists gives the student control over the order in which to proceed. Under Phoenix's solo mode, a student can complete course topics in any sequence or choose not to begin a topic at all, because completion information is not tracked. This structure is ideal for the training needs of both the information center and the applications development center, where learners possess a wide range of knowledge and skills.

Design strategy

Within the framework of the actual instruction, topics can be organized and presented in a manner that helps the learner assimilate technical information. A good design strategy for CBT is to limit instructional units to three or four related subjects, followed by a review and application.

Exercises on the actual software at the end of a unit or topic reinforce the learning process. Because many users are managers or nontechnical staff, mastery testing before and after instruction is not needed. The ultimate success of the CBT course will be measured in terms of the student's ability to use Mathematica Product Groups, Inc.'s Ramis, SAS or Isaco, Inc.'s Tel-A-Graf, for example.

The length of a topic is not always a clear indication of well-organized and manageable instruction. Overall, however, shorter topics of 10 to 30 minutes probably help students retain technical information better. This point is especially true for courseware without a "backpaging" facility that allows students to go back and review a previous screen. It may be difficult to judge the length of a topic without completing it, as courseware rarely lists completion times for individual topics. Still, topic length is a factor to consider if such information is available.

The sequence of instruction in CBT is important, as it is in all successful training design. Two logical CBT designs are a "step-by-step" structure and a "least-to-most complex" ordering of concepts. The list of courses and topics will indicate a progression starting with getting onto the software, entering and editing data and leading to more advanced topics, such as formatting and printing.

When CBT lacks a clear design, it does not build on the student's growing body of knowledge and skills. The result is a disorganized user who does not know how to approach the actual software. Design weaknesses are more obvious in CBT than in text material, where a student can easily page back and forth between sections of instruction. Effective CBT on fourth-generation languages will be constructed so that most, if not all, instruction takes place at the terminal.

A student handbook may accompany the on-line instruction. This guide may contain a topic listing, examples, exercises, reference pages and space for individualized logon procedures and student notes. CRWTH calls this supplement a student workbook; in fact, it simply summarizes the on-line instruction and includes data for case-study applications.

CBT that relies too heavily on textbook or video support may lose its ability to simulate the software being taught. Video and CBT can work well together if a video segment introduces concepts reinforced by subsequent exercises on the computer. Execucom Systems Corp., for example, is developing a series of videos on its popular financial planning package, IFPS. A supplementary workbook, developed to accompany the videos with on-line exercises, is an alternative to actual on-line instruction. The weakness of this approach is that the student misses the specific corrective feedback that is typical of good CBT.

Practical applications

The use of practical applications is another characteristic of effective CBT, especially where fourth-generation languages are concerned. To the extent possible, examples should reflect business cases the manager or end user might experience or the programmer might encounter in dealing with users. Besides learning how particular software works, students need to see why they might want to use the software in that way.

While learning SAS, for example, the student will be shown how to produce a pie chart. In addition to learning the syntax required, the student needs to know when to use a pie chart. Effective CBT will place the student in a situation where a judgment is required. Corrective or reinforcing feedback should direct the student in the choice of command syntax to fit that situation and others like it.

Good CBT combines an understanding of a language or system with an appreciation for situations in which specific activities, commands or procedures can best be used. Solid examples and applications are difficult for course authors to produce in any medium, much less CBT. DP managers should note this potential drawback and check CBT for problems, examples and exercises

Cut Information Retrieval Down To Size

...with BRS/SEARCH— the Software That Comes In Mainframe, Micro and Mini Sizes.

BRS/SEARCH, the same information retrieval software that runs one of the world's largest online database systems is now available for your mainframe, mini, or micro computer.

BRS/SEARCH gives you instant access to all your own information, regardless of its length or format. Many powerful, easy-to-use features developed through millions of online searches have made BRS/SEARCH the system of choice among information professionals.

BRS/SEARCH runs on IBM and compatible mainframes, as well as 16 and 32 bit mini and micro computers. And because the search query language is the same no matter what size computer, you can use it on a variety of systems without any additional training.

For more information about these three new sizes of database software, call toll free: (800) 833-4707; in New York State (800) 553-5566. Or write BRS Software Sales Support, 1200 Rte. 7, Latham, N.Y. 12110. Dealer and OEM inquiries invited.

that relate concepts to real-life situations.

Computer-based training should be highly interactive, involving the student in a constant thought process. CBT that merely involves "page turning," or in other words, screens of text without student input, is an expensive substitute for stand-up lectures or print materials. The cost of CBT varies among training vendors; individual courses may cost twice as much as print or lecture materials, with discounts often available to larger groups.

However, designing meaningful interaction is a tough and time-consuming process for CBT course authors. It's an easy — and common — practice to cut down on student interaction in order to reach the training market quickly with CBT courseware on popular programs like Ramis or Focus.

In short, DP managers should not assume that CBT on software like SAS or Focus is the exclusive domain of the information center. The rapid growth in CBT usage suggests that many more organizations are coming to this realization.

Because there's so much variation in the interactive quality of CBT products, a DP manager should not judge a CBT course without looking at it carefully. If a course covers a broad range of material in a relatively brief time frame, the amount of student interaction may be minimal. One CBT course promises to teach the student how to enter data, view data, use editing commands and print data in 100 minutes of instruction. The time frame quoted would curtail on-line practice because the course covers too many major concepts during that time.

Apart from brochures and promotional materials, some training vendors offer customers an opportunity for limited testing of CBT courses, such as a 30-day free trial, before the actual purchase.

Other features should be considered when analyzing the interactive nature of a CBT course. Some CBT authoring languages lack the ability to simulate actual software or systems. Some languages are limited in the types of questions that can be asked; others are limited in the ability to judge answers and provide specific feedback. In other words, the authoring language used to develop CBT affects the overall quality of the instruction.

Determining quality

One way to determine quality is to observe the answer-judging capability of a CBT course. When students answer a question incorrectly, they should receive feedback specific to that answer and not a catchall response. Partial or "close" answers should be recognized, and students should never be "trapped" in a question. After three or four tries, they should view the correct answer and move on.

Such subtleties of CBT interaction may require a close comparison of training vendors' products. A good rule of thumb for CBT authors is to provide student interaction every three to five screens. This rule is not strict, of course, and content sometimes necessitates placing several screens of text together.

The overall result, however, should engage the student in an active process of thinking and responding to the instruction.

DP managers can easily discern whether a CBT course engages the student interactively. A closer analysis will reveal whether the quality of the interaction is sufficient to actually train the student. Some types of questions, such as yes/no, true/false and multiple choice, help reinforce concepts but don't teach students how to produce lines of code. A balance between concepts and practice is best for most types of CBT. Also, the closer the CBT approximates the "look" and "feel" of the actual soft-

The Goal News

LOGICAL beats PHYSICAL

For OS/VS

LOGICAL DUMP/RESTORE OFFERS VAST PERFORMANCE GAINS

We are pleased to report that the people who have tried FAVER/XP, the "smart" backup/restore system, are pleasantly surprised at the difference Logical makes.

Most people are used to a physical-design dump & restore system. To backup a single dataset across a number of tracks, they have to physically back up each track. The logical approach of FAVER/XP lets the system back up just the dataset you want, no matter how many volumes it occupies.

You can back up clusters, groups of clusters or an entire catalog this same way. It's much easier with FAVER/XP and everything happens faster.

Plus, FAVER/XP integrity-checks all VSAM datasets for errors before it backs up anything. If it finds anything, you know about it. If everything's OK, the backup runs automatically. You can rest easy that your backups are clean.

Just to be sure, though, you can invoke the COMPARE function to ensure that the backup tape contains exactly the same data as the disk.

Works with VSAMAID/XP for total VSAM management

Goal Systems International has revealed that they have an interface between the FAVER/XP Backup & Restore system and the VSAMAID/XP system which creates the only complete VSAM dataset management system available today.

During backup, the FAVER/XP special interface creates a historical file, which may then be used by VSAMAID/XP to create a "recommendations" report. The report tells resource managers how to manage VSAM datasets for optimum space allocation and resource utilization. VSAMAID/XP recommendations may be implemented with one command through the VSAMAID/XP Auto-Define feature.

FAVER/XP beats IDCAMS

In benchmark tests where an OS/VS installation runs backup & restore routines using IDCAMS and FAVER/XP, FAVER/XP completes the tasks required in half the time.

These figures are taken from actual timings made by product managers at Goal Systems International, the authors of FAVER/XP. They cover 100 production installations spanning five years of operation.

"The difference in speed is due to a systems design that combines the speed of a physical dump/restore with the design philosophy of logical file access," said Theodore Peppas, Chief Developer at Goal.

Users amazed at the difference

When polled by this newspaper, users of FAVER/XP revealed that the Logical approach to backup & restore is genuinely faster, more accurate, and easier to perform.

Ralph T. Bryan, Systems Manager at Turbo Rubber Company said, "Have we had been operating all these years working our tails off just to do an accurate backup & restore. And FAVER/XP comes along and automates the task. It's about time.

"We had depreciated away our investment in our old physical dump/restore system years ago. It was time to buy FAVER/XP. We were ecstatic both for a performance, but now FAVER/XP is our standard."

FAVER/XP and VSAMAID/XP are great news for OS/VS installations. They are two of the Extended Productivity Systems from Goal Systems International. Both are available for a free trial. Call Goal Systems toll free today.

A checklist for CBT users

- Does the CBT cover information that users at this installation need?
- Is the course current and does it reflect the version of the software or system in use at this installation?
- Is it flexible and modular to accommodate the range of users?
- How long are instructional units?
- Is the sequence of instruction based on a logical pattern?
- How much of the instruction is actually on-line?
- Does the CBT use practical problems and examples to help students apply their knowledge?
- Does the student answer questions and practice activities, or is the course simply a "page turner"?
- Is there variety in the types of questions asked?
- Does the CBT simulate the actual software?
- What is the quality of the answer-judging and feedback? Is the feedback appropriate to specific answers?

"The office automation I bought for everyone in the corporation doesn't incorporate everyone."

Exxon stops the shock...with fully integrated office automation for everyone in the corporation.

Introducing the Exxon Business Support System.

An office automation system that can't support everyone in your corporation can lead to some very shocking experiences.

The right power to the right people

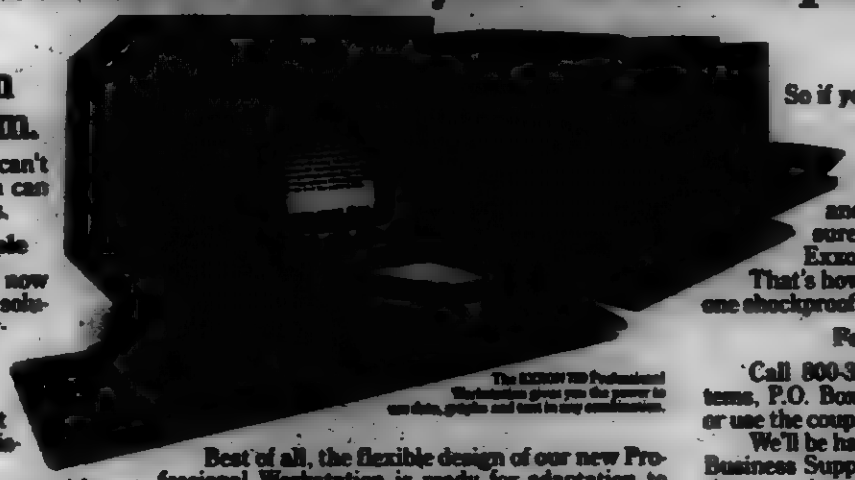
That's why Exxon Office Systems now offers more practical office automation solutions that help everyone in the corporation to be more productive. With the Business Support System, Exxon extends its fully integrated line of office automation products to support managers, professionals, and administrators, as well as secretarial staff.

Exxon puts it together for everyone with a fully integrated system — with full communications flexibility that lets you access outside databases and interact with most mainframe computers. Without the complications. Without the shock.

Office automation for those who shape the corporation

The Exxon Business Support System features the new EXXON 750 Professional Workstation, specifically designed with powerful, integrated software that lets you move instantly from text to graphics to data processing — without changing programs.

You can divide the high resolution bit-map display into several windows and work in a number of functions simultaneously. You can shift information from one window to another. You can preview the page layout, and produce an integrated text/graphics document on our quiet EXXON 985 Ink Jet Printer. Or on a color plotter.



The EXXON 750 Professional Workstation gives you the power to use data, graphics and text in any combination.

Best of all, the flexible design of our new Professional Workstation is ready for adaptation to the most popular operating systems and network interfaces.

Tying everyone together

At the core of the Business Support System is the EXXON 8400 Series controller. With its UNIX*-based operating system, it can integrate all levels of workstations to share information and programs. Everyone can keep track of schedules and meetings with time management and calendaring functions, whether their workstation is an EXXON 500 Series Information Processor or a new EXXON 750 Professional Workstation. And everyone can send and receive messages easily with transparent electronic mail.

An expandable, shockproof family

Exxon protects your office automation investment by making every workstation — from the EXXON 500 Series to the new EXXON 750 Professional Workstation — fully expandable and upgradeable.

So if you've already begun an Exxon system, the latest Exxon advances are completely compatible with our current product line.

And with our worldwide sales and service organization, you can be sure that when you need assistance, Exxon will be there.

That's how Exxon incorporates everyone—in one shockproof family.

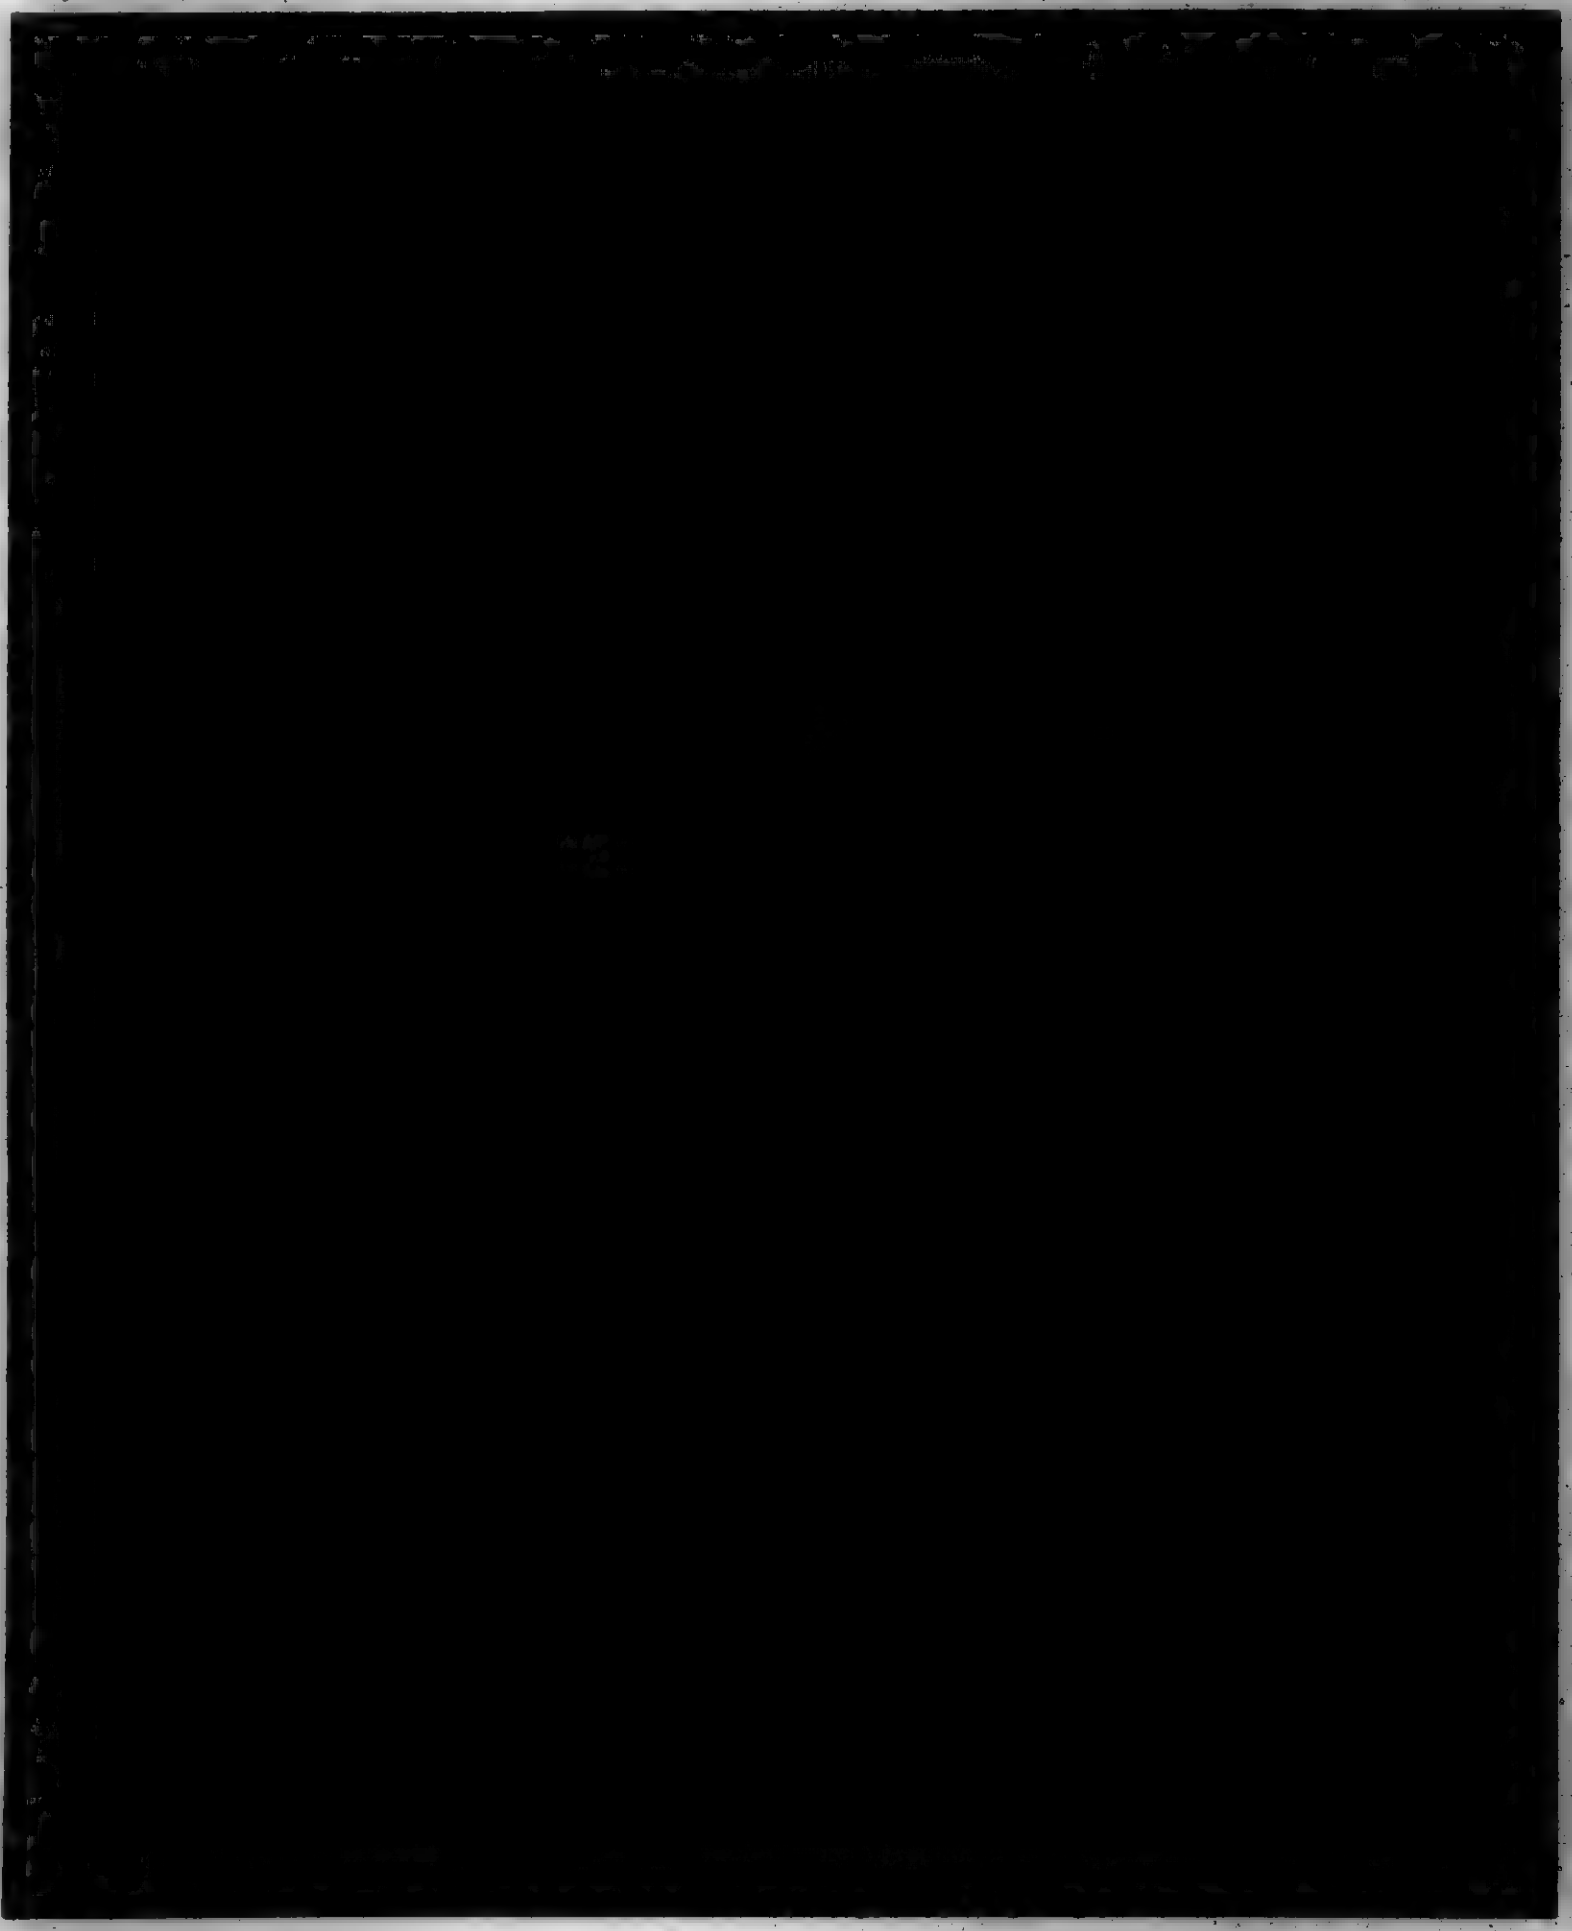
EXXON OFFICE SYSTEMS

The future. Without the shock.

NOW THAT YOU'VE GOT EVERYONE ON-LINE...



HOW ARE YOU GOING TO KEEP THEM IN LINE?

IS DATA CENTER MANAGEMENT SOFTWARE THE SOLUTION?

You bet.

Since large data centers are now controlling thousands of terminals, the *automatic* tracking of resources, users ... and their myriad problems ... has become mandatory.

The management of such a far flung organization has become so complex — and critical — that "going it alone" simply isn't feasible anymore.

So, UCC has developed a new kind of software package to help you effectively manage today's data center: UCC-8 Data Center Management Software.

WHAT IS DATA CENTER MANAGEMENT SOFTWARE ANYWAY?

It is a total solution to these new kinds of management problems ... not just a patch. It provides you with all the information and tools you ... and your people ... need to keep the operation running smoothly. It's a "Help Desk", an "Information Center" and a "Command Center" all rolled into one ... only better.

DOES IT HANDLE PROBLEM MANAGEMENT?

Yes. It will keep track of every one of your hardware and software problems. It will automatically respond to the problem ... and guide its solution.

DOES IT HANDLE CHANGE MANAGEMENT?

Yes. It will control all equipment and procedural changeovers ... every step of the way.

DOES IT HANDLE INVENTORY MANAGEMENT?

Yes. It will keep tabs on every one of your vendors, and every piece of their equipment.

WHAT ELSE DOES IT DO?

It will monitor the immediate status of every project in your shop. It will identify the expense associated with every particular problem. And it will help you determine priorities and assign responsibility for every project.

In fact, it can do all of this for your entire company ... as well as your DP Department!

HOW CAN I FIND OUT MORE ABOUT UCC-8?

Simple. Call us at 1-800/527-5012 (in Texas, 214/353-7312). We'll be delighted to answer all your questions about what is probably the most essential piece of software to come down the pike in years: UCC-8 Data Center Management Software.

[redacted]

The most complete software company in the world.

Designing meaningful interaction is a tough and time-consuming process for CBT course authors. It's an easy — and common — practice to cut down on student interaction in order to reach the training market quickly with CBT courseware on popular programs.

ware, the more comfortable and confident students will be in their skills.

CBT is an ideal training medium for the information center, where the range of users requires individualized pacing of instruction. As a DP manager, you may be responsible for organizing, staffing and maintaining that center.

In addition, increased computerization of information handling is changing the basic nature of DP training in many companies. In large organizations, the programmers and end users learning a language such as Focus may number in the hundreds or even thousands. Such demand can tax the training resources of both the information center and the DP department. CBT is a natural choice for situations like this because it provides a standard level of instruction across locations within the company while delivering training in features different audiences will be using.

The spread of data management and report writing software and fourth-generation languages affects the training needs of DP and non-DP managers alike. As a DP manager, you may find yourself in need of training on one or more of these tools. Because it is self-paced, CBT can meet your own training needs as well as those of end users or applications programmers.

Well-designed CBT that takes a modular approach to instruction can meet a variety of training needs within an organization, including your own.

The advantage of this type of approach is a focus on the material you and other managers or professional staff really need to know. It's a good way for DP and non-DP managers alike to develop computer skills that can enhance their own productivity.

In short, DP managers should not assume that CBT on software like SAS or Focus is the exclusive domain of the information center. The rapid growth in CBT usage suggests that many more organizations are coming to this realization.

As a DP manager, you may have had little prior knowledge of the new generation of CBT products. Not all courses are created equal.

The competition among CBT training vendors is strong, and the quality of the product varies widely as a result. Unfortunately, institutional decisions to rent or purchase CBT are sometimes made sight unseen because availability or price (or both) is attractive to management.

On the other hand, you can and should be aware of the basic qualities that make CBT effective. The CBT should reflect the release level and amount of information required by users at your installation. It should combine concepts and practice in manageable units of instruction. It should emphasize practical applications and include exercises on the actual software or system. It should be interactive and not an on-line user's manual.

With these guidelines, you will be well equipped to evaluate the usefulness of CBT courseware for your installation.

About the author

Carol Kouic Anderson is a project coordinator of instructor-led training for the Consulting Services Division of Deltak, Inc., Naperville, Ill. Previously, she was a data processing training coordinator and product developer for Deltak. She recently completed four computer-based courses on ISPF for end users.

Statistical Multiplexers From Paradyne

Paradyne's series of Intelligent Networking Multiplexers is now a family of network solutions. With User Switching and Auto Rerouting, hundreds, even thousands of your employees and customers can depend on your network.

User Switching For Efficient Communications. To be productive you need computer resources. User Switching provides a way for users to tap into the variety of your company's resources, regardless of where those computer resources are in the network. Paradyne's DCX multiplexers find the most efficient communications path to each computer.

Auto Rerouting Means Increased Productivity. Auto rerouting maintains the connection to the computer and insures user productivity in the face of degraded telco lines. When a link fails, DCX automatically looks for alternate routes in the network to reroute communications traffic, insuring continued productivity.

Advanced Networking Diagnostics. Paradyne offers the most advanced networking diagnostics in today's market. Both data and controls can be viewed to and from any channel in the network. Problems at a remote site can be isolated and diagnosed through DCX, quickly and easily.

Productivity and Efficiency. Another Paradyne systems solution. If you would like to know more about Paradyne's Series of Intelligent Networking Multiplexers call **1-800-482-3333**. We'll answer your questions and give you the location of the Paradyne sales office nearest you.

DCX 815...four or eight channels. DCX 825...four to 32 channels. DCX 840...240 channel data networking exchange. DCX 850...240 channel intelligent networking processor. DCX 861...four or eight channel statistical multiplexer with an integrated 9,600 bps modem. DCX 871...four to 32 channels with integrated 9,600 bps modem. And Paradyne's NEW T1 Multiplexer...combining the channel capacity of T1 facilities with the versatility and networking capabilities of the DCX product line.

Meeting the Communications Challenge of the 80's

paradyne

Paradyne Corporation P.O. Box 1347 8550 Ulmerton Road, Largo, FL 33540

IN DEPTH

How to win over colleagues and influence the company

The effective manager of the 1980s must learn how to meet departmental objectives in situations where he has no control over the people whose cooperation is essential. The manager needs influence — a specific set of behaviors and skills that can be learned.

By Jane Carroll Jackson

As Adam Michaels sees it, his job as MIS director is changing rapidly, and he has to change with it.

"In the old days, I spent most of my time in my office. I think everyone else in the company was a little afraid of me because I knew about computers and they didn't. They saw me as that techie in shirt-sleeves down in the basement. And that's where I actually was — down in the basement. I was cut off from everyone else except when someone called to ask if I could do this or that. I never seemed to be part of things, and consequently I got a little defensive. Deep down, I felt like a kid who has been left out of the game — you know, a bench warmer."

The "old days" weren't so very long ago. In the 1950s, the DP manager was a "waiter," in both meanings of the word. He waited down in his office until someone called him upstairs with a request. Later, when the job was done, he'd serve it up to them and go back downstairs to wait some more.

IN DEPTH/INFLUENCING PEOPLE

But the switch from ledger books to electronic screens and printouts suddenly allowed the numbers to be manipulated in previously unimagined ways. Add in the rapid rate with which DP systems increased capacities, speed and efficiency, and you have the ingredients for the MIS revolution of the 1960s. More and more departments began looking to MIS for ways of finding information that could reduce the "guess element" in decision making.

"I don't sit down in the basement anymore," Adam says with some satisfaction. "My office is up here with everyone else. Now I'm a member of the management team. I'm the manager of a department that is integrated with all the other departments. It feels a whole lot better to be part of the action, but now I have a new responsibility.

"I've got to get out of my office and sell my services to the other departments. Some of them still aren't sure how MIS can help them, or they still have some computer fears. I've got to overcome that. I'm learning how to do it, but for me it's a whole new game."

The problem is that Adam, like most MIS managers, was not prepared for this new role. He had no training and very little experience to fall back on. "There I was, sitting on the bench. All of a sudden they threw me into the game and gave me the ball, but nobody told me how to play. So I've had to learn as I go."

Learning process

What exactly has Adam had to learn in order to meet the new responsibilities of his job? There are several answers to this question. In the first place, he's had to learn to be active rather than reactive, to initiate rather than wait. But he's also had to learn how to meet his departmental objectives in situations where he has no control over the people whose cooperation is essential to the success of any given MIS mission or task. "If I was captain of the team, my job would be a lot simpler," Adam explains. "I'd just tell the other players what to do, and they'd do it. But on the teams I play for now, we're all captains."

Adam, for example, can't tell Tom Harris, the director of marketing, what to do. But if Tom declines to participate in Adam's idea for developing better information for the marketing department, Adam will not be fulfilling his own responsibilities. He needs Tom's cooperation and expertise, but he can't command it, so he must gain Tom's cooperation some other way. One of the best ways is by using influence.

In today's business world, influence is understood as the ability to produce results through other people over whom you have no direct control.

By the very nature of their positions as internal consultants, MIS managers usually find themselves in situations where they have to rely on influence in order to reach their objectives, but they are not alone. In today's business environment, where chains of command are frequently less clear and authoritative than they used to be, influence is needed by most managers at all corporate levels.

A division president does not have his own marketing staff, so he must share corporate marketing resources. How does he manage to get his fair share of those resources when he doesn't control them?

A product manager must work through manufacturing and sales in order to reach his own objectives. But how does he get them involved, committed and motivated when he has no authority to tell them what to do?

There are many other examples of situations in which authority is not clear-cut or has been spread around to several of the players. And these ambiguous situations are increasing.

Remodeled pyramids

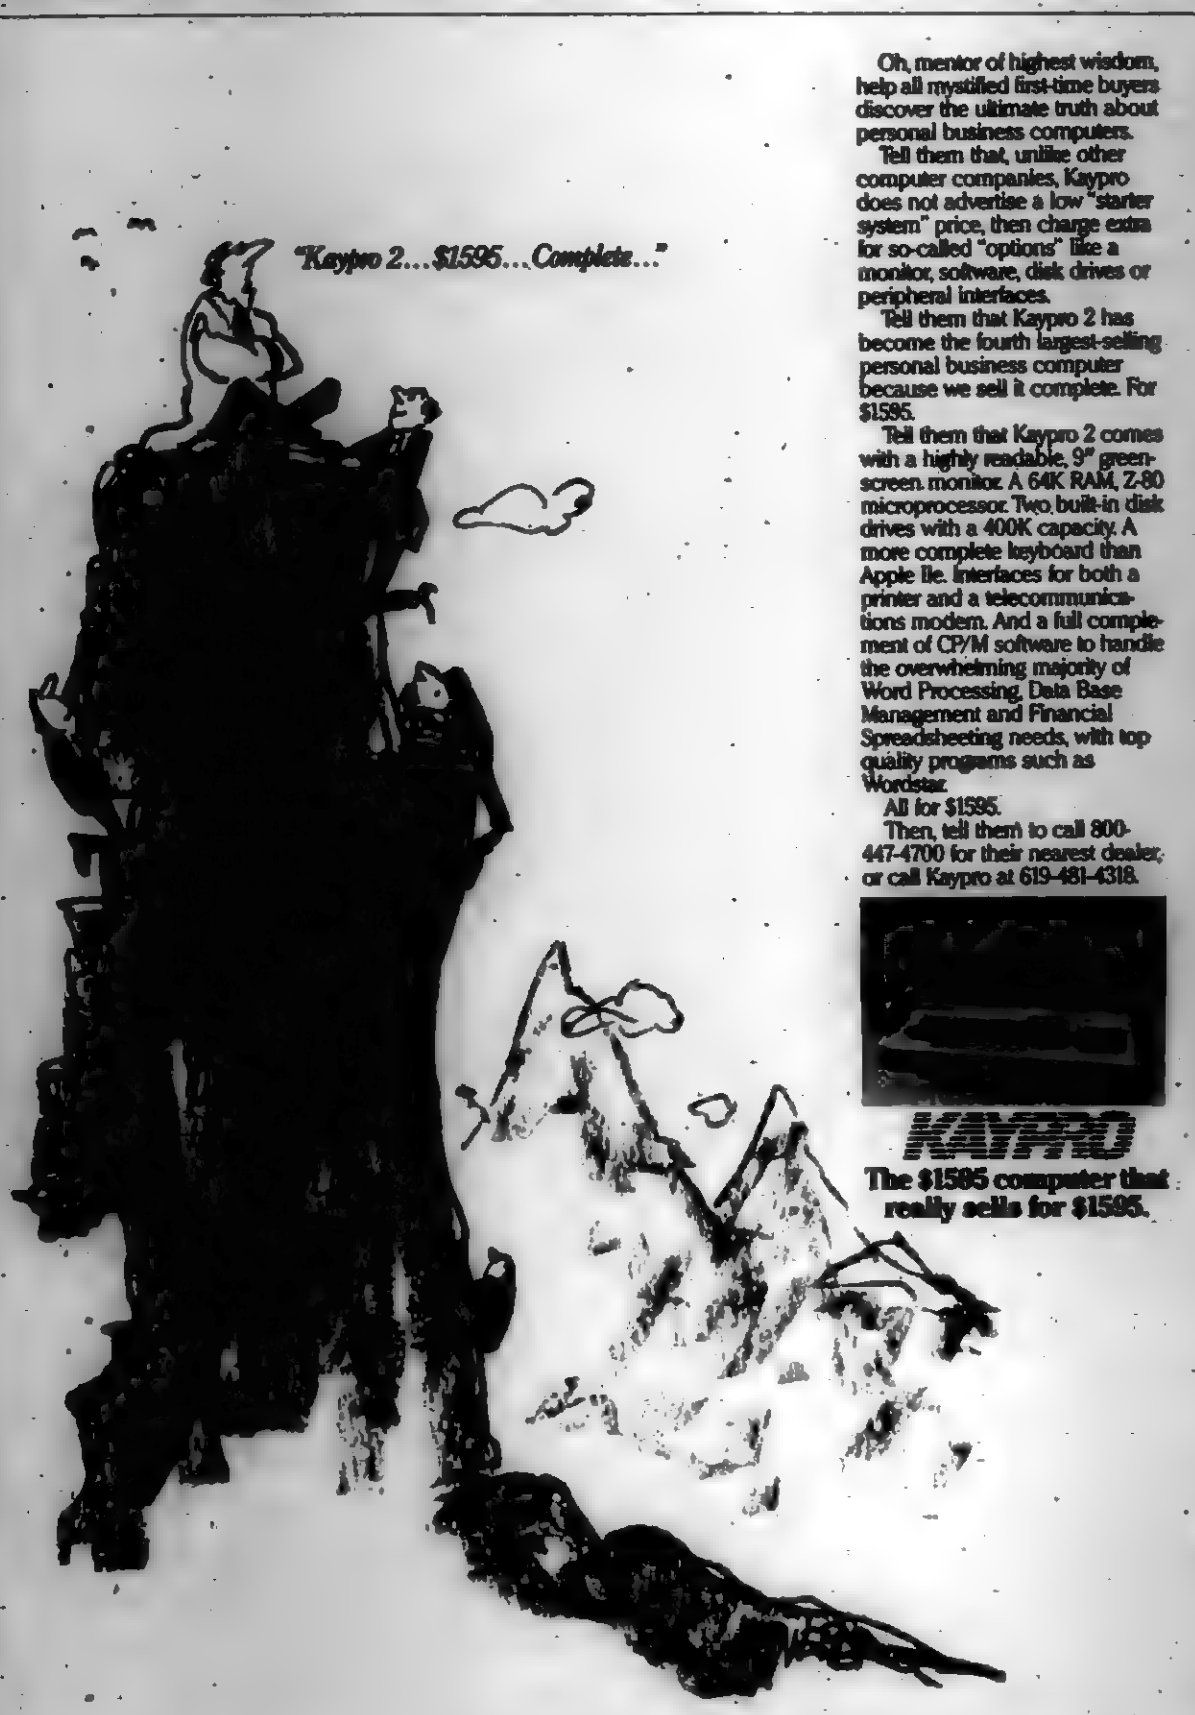
Not too long ago, most American corporations were organized as pyramids: Power originated at the top and came down in the form of orders, directives or commands. Managers were supposed to manage other people by the power of position they had over them.

Today many companies have remodeled their pyramids into flatter structures. Managers often find themselves on a team of peers where the need for flexibility, adaptability and tolerance for ambiguity in corporate settings has increased. All of these adjustments are examples of the need for influence behavior.

In response to these changes, the more quick-footed of today's managers have developed a new, nontraditional way of acting in order to reach their goals. Instead of relying on the rigid hierarchy of authority, they use influence.

Adam Michaels is quick-footed. His interaction with Tom, the marketing director, is a good example of his new managerial skills. Adam needed Tom's cooperation, commitment and knowledge in order to get results, but remember, he had no authority over him. All he could do was *sell* Tom the idea or, to put it another way, all he could do was influence him.

"When I first got the idea, I sent Tom a memo telling him what I had and how it could help him. When I think back on it, maybe I was a little too abrupt. At any rate, Tom sent a reply, which basically said he was up to his ears in other things and didn't have time to discuss my idea. He'd let me know when he could. Imagine that! There I was offering him a good idea, and he was playing hard to get. I felt like telling him what he could do with his 'time.' What did he think, my job was pressure-free?



Oh, mentor of highest wisdom, help all mystified first-time buyers discover the ultimate truth about personal business computers.

Tell them that, unlike other computer companies, Kaypro does not advertise a low "starter system" price, then charge extra for so-called "options" like a monitor, software, disk drives or peripheral interfaces.

Tell them that Kaypro 2 has become the fourth largest-selling personal business computer because we sell it complete. For $1595.

Tell them that Kaypro 2 comes with a highly readable, 9" green-screen monitor. A 64K RAM, Z-80 microprocessor. Two built-in disk drives with a 400K capacity. A more complete keyboard than Apple IIe. Interfaces for both a printer and a telecommunications modem. And a full complement of CP/M software to handle the overwhelming majority of Word Processing, Data Base Management and Financial Spreadsheeting needs, with top quality programs such as Wordstar.

All for $1595.

Then, tell them to call 800-447-4700 for their nearest dealer, or call Kaypro at 619-481-4318.

KAYPRO

The $1595 computer that really sells for $1595.

YOU DON'T HAVE TO PICK OUR EQUIPMENT TO PICK OUR BRAINS.

Whether you're an AT&T customer or not, the Communications Management Institute will provide you with the latest knowledge you'll need to better manage the planning, implementation and ongoing control of information management systems.

For more than 100 years AT&T has pioneered the field of Information Management, with an endless stream of innovations. Today, no one else is better prepared to review the state of Communications and Information Management Systems—from our products to our competitors' products.

Courses will be held at Callaway Gardens in Pine Mountain, Georgia—one of 63 conference centers nationwide to receive a Four-Star Award. So you'll experience an environment conducive to learning, with outstanding accommodations.

See the schedule for detailed course objectives. Register now for seats March through July. But hurry, seats are limited.

Communications Management Institute

Call 1 800 222-4884 ext. 21 to enroll. Or fill out the attached coupon with payment or purchase order and return it to Communications Management Institute, P.O. Box 8, Pine Mountain, Georgia 31822-0008.

INFORMATION RESOURCES PLANNING "AN APPROACH TO OFFICE INFORMATION SERVICES"

3½ Days—$800
Mar. 12–15, May 14–17
Jun. 11–14

This course is for the managers and influencers who are responsible for improving the productivity and the effectiveness of people in their office environment. It provides a simulated experience in managing office information resources. This interdisciplinary approach will broaden the perspective of the planning, needs assessment and design process necessary for total office systems integration.

COURSE OBJECTIVES

Upon completion of this course, participants will be able to:

- Establish a planning process for office automation by applying fundamental organizational planning concepts.
- Extend the office automation planning process to include specific methodologies for identifying opportunities within the office that offer high potential for return of investment.
- Design and strategically manage an office automation plan with emphasis on positive performance.
- Communicate more convincingly the benefits of office automation concepts and technologies through the use of presentation aids and techniques.
- Accelerate the positive progress of office automation by providing an innovative approach to employee education and involvement with the implementation process.

INFORMATION DISTRIBUTION MANAGEMENT "NETWORKING FOR THE 90's"

4 Days–$920
Mar. 19–22, Apr. 9–12
May 21–24, Jul. 16–19

This course is aimed at managers who need increased information management skills to be more effective in their responsibilities. It provides an overview of the distributed information concepts and systems necessary to manage the planning, implementation, and ongoing control of an information network—with emphasis on the planning and management functions.

COURSE OBJECTIVES

Upon completion of this course, participants will be able to:

- Describe the changing role of information distribution management and apply a systematic approach to their information management responsibilities.
- Understand voice and data network applications, features, and operating characteristics.
- Determine potential applications for local area and value-added networks for their companies.
- Evaluate integrated data, voice, facsimile, and video systems—including CBX and networking alternatives.
- Manage the use of current approaches and procedures involved in planning, implementing, and controlling a network.
- Apply current approaches in economic evaluation of a network.

LOCAL AREA NETWORKING "BUILDING FOR THE FUTURE"

3½ Days—$800
Mar. 19–22, Apr. 9–12
May 14–17, Jul. 23–26

This course is aimed at individuals with responsibility for planning communications networks. It deals with those areas of the corporate environment where local area network solutions are applicable. The course will further examine individual vendor offerings and the management and control systems which ensure optimum performance of a local area network.

COURSE OBJECTIVES

Upon completion of this course, participants will be able to:

- Plan, design and effectively implement a local area network.
- Define primary and secondary applications within the corporate structure.

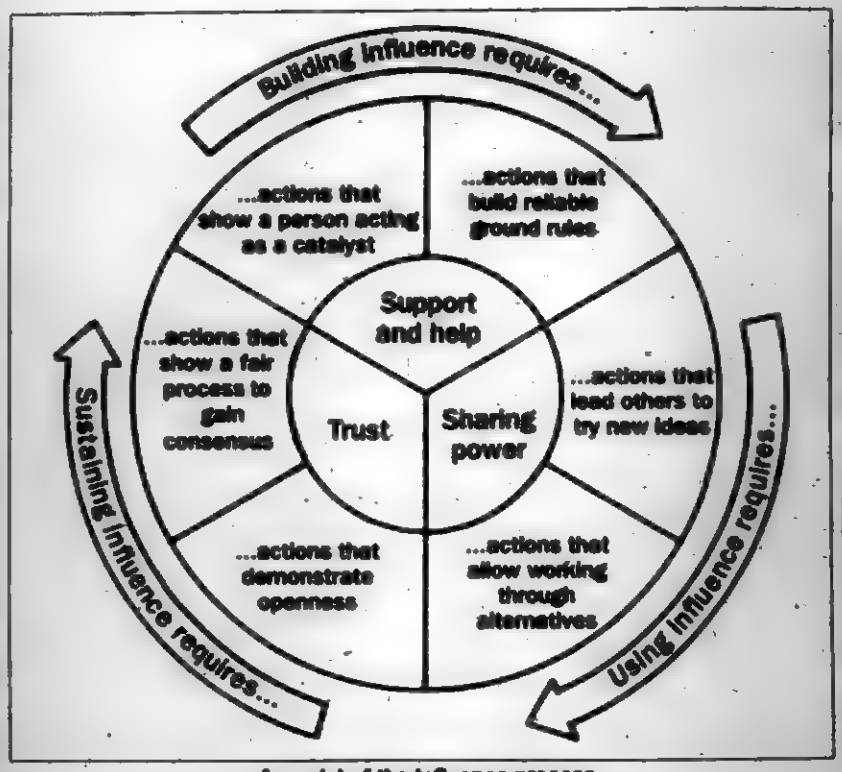
"A couple of weeks passed with no word from Tom, but in anticipation of developing the marketing project, I hired two new people. Now I was ready to go, but I was under the gun to justify their cost. So you can bet I didn't forget about Tom. Marketing was potentially one of my biggest customers.

"Then at a planning meeting a loud shoe dropped. Top management wasn't very happy with the entire DP/MIS operation. They said we weren't being fully utilized, so they decided to put the entire sales system on the computer to track and monitor all sales force activities.

"Well, I thought, here's my chance to show what I can do. It would mean a lot of work, but it was just what I was asking for. And it was immediately apparent that this new system would have a big impact on marketing. Tom said he didn't have the time right now. I'd just have to make him find it."

The next day, Adam phoned Tom and blurted out his whole story. MIS was under the gun; the clock was ticking; Adam's people were ready to begin on the sales system; it was the best time to do the marketing system and so on. He hardly gave Tom a chance to get in a word. But when he was done, Tom's position hadn't changed.

"I'm under pressure, too," Tom said. "If I get my people involved in a new system right now, they'll never get their other work done. I don't have time for your project now. And just so you know for the future, when it comes to marketing, I make the decisions."



A model of the influence process

Adam's telephone approach failed for several reasons. The most important of these was his impulsiveness. After Tom hung up, Adam sat at his desk and began to wonder what he'd done wrong.

"I was angry at Tom, no doubt about that. But I was also angry at myself. I was putting out effort, but I wasn't getting results. That's when I started to think about the way I do things.

Two motives

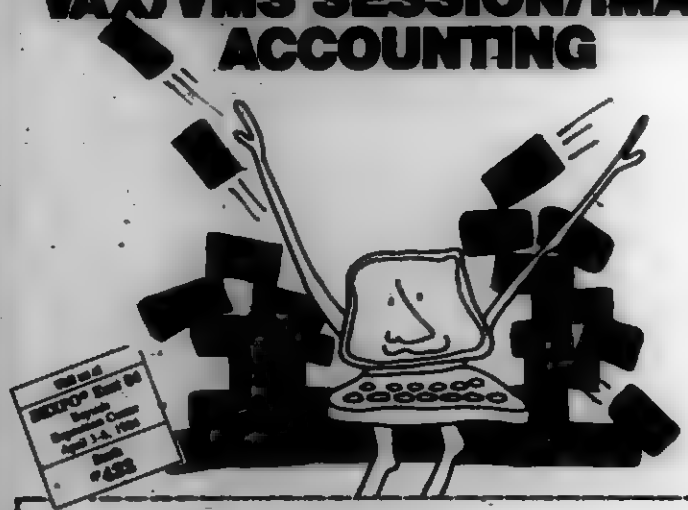
"I had two interests in mind in my dealings with Tom. I wanted to get the marketing program on-line so my department would have more to show. And I wanted to get it started immediately so it would integrate more easily with the sales program and save my department some money, which was one of my goals. These were my selfish interests.

"But I also wanted to help him. I knew the program would be terrific for marketing, and if he agreed to it, he'd thank me later. As I thought about it, I saw that I hadn't used the best approach in the first place. And the phone call had made things worse. Most importantly, I saw that I didn't have a plan. I just got the idea and fired it off.

"I had to come up with a plan that had several elements. I had to get Tom's go-ahead, which meant he had to trust me. I had to get his commitment and his agreement on what role he would play.

"We had to agree on what rules we'd follow for decision making, which meant that everyone involved would have to know their roles and responsibilities. We had to agree on the specifics to implement the plan.

BREAKTHROUGH IN VAX/VMS SESSION/IMAGE ACCOUNTING



Only EZTRACK™ allows examination and tracking of VMS session/image resource data by user, time interval, terminal port and other key fields. EZTRACK offers:

- General query and interactive capabilities
- Flexible report writer and graphics
- Full screen forms reporting

The TeleVideo IBM PC compatibles. The best hardware for the best software.

TeleVideo versus IBM. Make a few simple comparisons and you'll find there is no comparison.

RUNS IBM SOFTWARE.

With the TeleVideo® IBM Compatible line—PC, XT and portable computers—you'll get the most out of all the most popular software written for the IBM® PC—more than 3,000 programs.

Because every TeleVideo Personal Computer offers the highest level of IBM compatibility on the market and has the standard—not optional—features you need to take full advantage of every job your software can do.

THE BEST HARDWARE FOR THE BEST PRICE.

Features	Tele-PC	IBM PC	Tele-XT	IBM XT
Monitor	YES	OPTIONAL	YES	OPTIONAL
Screen Size	14"	12"	14"	12"
Tilt Screen	YES	NO	YES	NO
Quiet Operation	YES (NO FAN)	NO	YES	NO
Memory	128K	128K OPTION	256K	256K OPTION
Graphics Display (640 x 200 resolution)	YES	OPTIONAL	YES	OPTIONAL
Printer Port	YES	OPTIONAL	YES	OPTIONAL
Communication Port	YES	OPTIONAL	YES	YES
MS™DOS/BASIC®	YES	OPTIONAL	YES	OPTIONAL
System Expansion Slot	YES	YES	YES	YES
RGB and Video Port	YES	OPTIONAL	YES	OPTIONAL
Typical System Price	$2995	$3843	$4995	$5754

Study the chart below. It proves that TeleVideo—not IBM—offers the best hardware for the best price.

Note that TeleVideo's ergonomic superiority over IBM extends from fully sculpted keys and a comfortable palm rest to a 14-inch, no glare screen that tilts at a touch.

THE BEST MICROCHIPS.

What is perhaps most impressive about the TeleVideo IBM PC Compatible can be found deep within its circuitry. We use the same 8088 central processing unit that runs an IBM PC. But we also employ new VLSI (Very Large Scale Integration) microchips that are designed and built exclusively for TeleVideo. These interface more efficiently with the powerful 8088 and yield numerous benefits.

For example, our tiny custom chips do the work of many of the larger, more expensive circuit boards in an IBM PC. So we can offer a computer system that comes in one attractive, integrated case, is ready to run and occupies less desk space. A computer that edges out IBM's added-cost component system for reliability, ease of service and purchase simplicity.

Fewer circuit boards to cool also allowed us to eliminate the noisy, irritating fan IBM and most other PCs force you to put up with. And TeleVideo compatibles accept any IBM hardware options without modification.

THE BEST PORTABLE FOR THE BEST PRICE.

Features	TPC II	COMPAQ
High Capacity Storage	YES	NO
2nd Disk Drive	YES	OPTIONAL
Quiet Operation (No Fan)	YES	NO
Ergonomic Display	YES	NO
Communication Port	YES	OPTIONAL
International Power Supply	YES	NO
MS™DOS 2.11	YES	NO
Graphics Display	YES	YES
Typical System Price	$3995	$5718

THE BEST LINE.

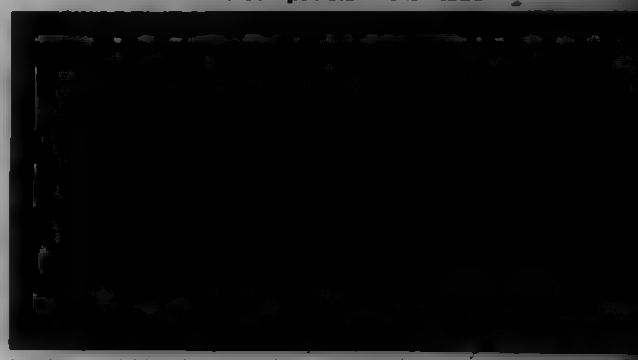
But the Tele-PC is only one element of the TeleVideo IBM PC Compatible line.

The TeleVideo XT is the best hardware for users of popular IBM XT software who would appreciate an extra 10 megabytes of storage capacity along with the advantages listed on the chart at the left.

As the chart above demonstrates, our portable IBM compatible computer, the TPC II, is far and away better hardware than COMPAQ.™ Better hardware—standard—at a better price.

THE BEST MANUFACTURER.

The TeleVideo IBM PC Compatible line is made by the world leader in multi-user computer systems and the number one independent manufacturer of terminals.



Our compatibles are available at participating ComputerLand and Entré (call 800-HI-ENTRE) dealers or you may call 800-538-8725 for the dealer nearest you. In California, call 408-745-7760.

Before you invest, make a few simple comparisons. You'll find that TeleVideo—not IBM or COMPAQ—has the best hardware for the best software. At the best price.

IBM is a registered trademark of International Business Machines. MS is a trademark of MicroSoft Corporation. GW Basic is a registered trademark of MicroSoft Corporation. COMPAQ is a trademark of COMPAQ Computer Corporation.

Study identifies components of influence behavior

The growing need for influence behavior in the business world led The Forum Corp. to conduct a study to discover if successful influence behavior could be broken down into specific components. If so, Forum wanted to find out if these components could be isolated, demonstrated and learned.

Data was gathered on more than 4,000 managers from leading corporations. The extensive data base contained more than 24,000 responses concerning the skills and practices of these managers in the areas of task performance and interpersonal relationships.

The responses came from their peers, co-workers and higher level managers. The data base also included performance ratings on the 4,000 managers from knowledgeable senior managers. The study confirmed the existence of specific practices that make for successful influence behavior.

Prior to this study, influence behavior had not been clearly defined for the business world. It had been observed in the actions of successful managers, but it was generally assumed to be a "gift" or the result of personality features; if you weren't born with it, you could never get it.

Analysis of the data reversed this assumption. Forum has identified specific patterns of behavior that distinguish high performers from moderate performers.

In an earlier study, Forum had identified 23 practices that are critical to effective performance in an influence environment. In its most recent study, it determined that these practices tended to fall together in clusters. In addition, there was a correlation between a number of tactics that actually describe specific managerial actions and the 23 influence practices.

Successful influence behavior is not defined by personality. Influence skills are grounded in a multifaceted process that involves analytical behavior, logical behavior, creativity and good interpersonal skills.

The result is a description of influence behavior that can provide specific information on how others perceive a person's use of influence practices, as well as a detailed prescription for improving performance.

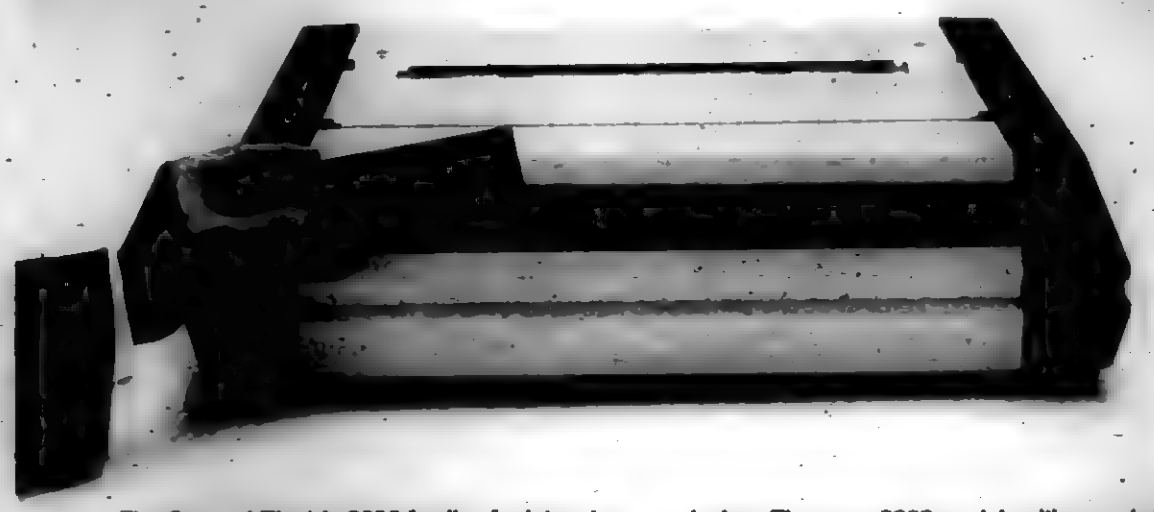
Successful influence behavior is not defined by personality. Influence skills are grounded in a multifaceted process that involves analytical behavior, logical behavior, creativity and good interpersonal skills. These skills and practices can be learned and used.

The benefits of influence behavior are available to managers who make the effort to learn how to use it. There is a method for dealing with managerial situations in which you have no direct control.

In the three-day Forum Influence Seminar, participants learn to analyze, build, use and sustain influence. Teaching techniques include simulations, group tasks, role playing, case studies, individual and group exercises and video. Each participant receives an individual feedback report rating his performance on the 23 influence practices that make up the process. Through individual personal-planning sessions, participants develop a specific plan for what they will do differently when back on the job.

ONE OF THE BEST BRAND NAME PRINTERS HAS A BRAND NEW NAME.

GENICOM



The General Electric 3000 family of printers has become an industry leading product. But now, this popular printer series has a new name, because the Data Communication Products Department of GE is now an independently owned company called Genicom.

At Genicom today, we offer the same complete line of printers we offered while a part of General Electric. We have the same facilities, the same nationwide service network, and the same corps of experienced employees...only the name has changed.

Above all, Genicom offers you the same reliable product quality you've come to expect from us over the years. Our Genicom 3000 printers feature outstanding performance for end-users as well as superior flexibility for many OEM's, distributors, retailers and dealers. There are 3000 models with speeds from 40 to over 400 cps. Single or dual mode printing. Type quality from EDP to NLQ. Multi-color printing. Graphics. Selectable type fonts. American craftsmanship and more. There are even 3000 family printers for personal computers...ideal for business needs.

We're proud of the excellent brand reputation we established under General Electric. But now we're going to make a new name for ourselves by bringing you more innovations, and more of the reliable quality you've always found in each of our products.

Genicom Corporation, One General Electric Drive, Dept. M331, Waynesboro, VA 22980. In Virginia, call 1-703-949-1170.

[illegible] FUTURE.

The highly sophisticated 5620 asynchronous terminal is indicative of what you'll be working with in the future, as well as what you can expect from Teletype Corporation. It's a low-cost, dot-mapped, UNIX*-based terminal that offers a good value in switched or point-to-point private line environments.

What's most impressive about the 5620 is its unique capability to divide the display into multiple "windows" of varying sizes. Our electronic red "Mouse" lets you easily create and control the windows. And because the host views each window as a separate terminal, several functions can be in process on the 5620 at once. For example, a programmer can work on one program while one or more are compiling and the terminal is receiving and displaying electronic mail. You can also download the 5620, and [illegible] programs independent of the host.

[illegible] While the 5620 is a programmer's dream, it's also a valuable [illegible] and contrast multiple business situations or cases simul- [illegible] while one or more are being executed; or to examine two sets of files [illegible] side by side.

[illegible] no matter how much you put on the screen. The dot- [illegible] per inch resolution on a 15 inch diagonal monitor. You can address a [illegible], which gives you full graphics capabilities. Line drawings and tracings can

[illegible] difficult to operate. You can use the "Mouse" to control [illegible] menus. There's also a full complement of ergonomic [illegible] enough to rest in your lap, a high resolution screen with [illegible] glare.

[illegible] nationwide service organization for prompt service. [illegible] take a look at our 5620. Its windows make it easy to [illegible]. For more information, write Teletype Corporation, [illegible] or call 1 800 323-1220, Extension 601.

[illegible] SETS US APART.

AT&T
Teletype Corporation

— who had to do what and when. We had to establish cost parameters and agree on a definition of expected results.

"Finally, all the members of the team, which would include my people, Tom's people and perhaps others, would have to be committed to move ahead and understand the roles they had to play.

"If it all worked out, this plan would save time and money. It would also lead to the best possible decisions because everyone involved would be putting in their best ideas.

"The first thing I did was to find out something about Tom. I casually asked around and learned two things that seemed important. One was that marketing was rolling out two new products.

"The other thing was his admitted reluctance to deal with MIS or any other service that would get him tied up with computers. It seems he was a little phobic about computers.

"Tom's an old-timer and a real pro. Everyone thinks he does a great job. But like a lot of people who get used to doing things a certain way, he was leery about change. Now I knew that he was under pressure and that he had a negative preconception about MIS. Once I was ready to address these real factors, I had a handle on the situation."

In a traditional hierarchical setting, a manager's power is his power to command. In influence situations, which by their very nature lack command, another kind of power has to be utilized. This power is based on one's own knowledge and expertise and is used to achieve collaboration.

Taking it slow

Adam reasoned that he ought to take a slow and easy approach. He decided to talk with Tom as soon as he could, but he wanted the setting to be as informal as possible. At the first opportunity, he casually joined Tom at a table in the lunchroom to share a coffee break.

Adam had two objectives on his agenda for his informal chat with Tom. First, he wanted to acknowledge Tom's current pressure. Second, he wanted to begin the process of defusing the computer/MIS mystique.

The purpose of this type of approach was to begin to establish a relationship that would lead to Tom's trust and eventually his cooperation and acceptance. After all, Adam thought, what I'm offering Tom can definitely reduce the pressure he's under, and at the same time I can teach him something about computers and MIS.

Over coffee, Adam made no mention of his idea. Instead, he made it easy for Tom to talk about marketing, a subject he truly liked. When Tom finished, Adam began to talk about the MIS department. He didn't try to convince Tom of anything, all he wanted to do was teach him something about MIS. By the time they'd finished their second cup of coffee, they had had a real exchange of information, and Adam felt he had accomplished his immediate objectives.

After their first talk, Adam and Tom had several more informal interactions. The result of these exchanges was an increased understanding of each other's departments and a growing sense of mutual trust. Finally, when they happened to meet on the elevator, Tom said, "I think it's time to talk about your idea, Adam. I'll call you this afternoon after I check my calendar."

How he did it

Adam succeeded in his effort to work with Tom and the marketing department. When his idea was finally implemented, after much input from Tom and his people, Tom did indeed thank him. The question now is: How exactly did Adam gain Tom's cooperation?

At first glance, it might seem that Adam just acted like a friendly guy whose pleasant personality won Tom over. On closer inspection, however, we see that Adam followed several important steps to reach his objective.

First Adam built a relationship, so Tom felt he was being supported. Then he purposefuly increased the amount and quality of the communication between them. As the process developed, he consciously involved Tom in the decision making and did not try to impose his own plan. The multiple inputs they received from each other and the one or two other people they consulted along the way increased the quality of their decision making.

And finally, through Adam's initiative, the two of them came up with an MIS plan for marketing that they could accept and implement.

ATS introduces MASTERKEY.

The ultimate way to unlock the mysteries.

If you're a DP Manager, you know that when it comes to unlocking the mysteries of the IBM® PC for your people, you couldn't ask for a more brilliant source than ATS.

(After all, who has more experience than we do? We've been unlocking the mysteries of computers for more than a decade.)

MASTERKEY establishes a whole new standard of tutorial excellence. Certainly, there are other good IBM PC teaching courses out there. Yet none combines in one package, the dazzling clarity, the building block by building block simplicity, the sweeping, comprehensive range of MASTERKEY.

Consider just a few of its advantages:

MASTERKEY makes learning a snap for anyone. It requires no previous training whatsoever — even for those who seem to have the least aptitude. In astonishingly little time, MASTERKEY will give them a solid grasp of the IBM PC. It does this through an extraordinary combination of powerful graphics, animation and sound. MASTERKEY also boasts another innovation: an interactive but separate audio cassette. This unique concept allows students to pace themselves with far greater ease, thereby making comprehension practically effortless.

Unlike virtually every other course, MASTERKEY doesn't content itself with just teaching the keyboard and the operating system. It goes well beyond that. Students are introduced to word processing, communications networks, business graphics and spreadsheets.

MASTERKEY leaves nothing unexplored. It offers full instruction on how to use the IBM PC as a smart terminal, and how to access, retrieve and store information from S/34-38. It even advises you on what additional software you may need.

As you can see, MASTERKEY is a tool of incalculable value. It enables you and your data processing department to take firm control over all data processing functions.

Sound good?

For more information — or to order MASTERKEY directly — simply call the number below.

Or write to: Automated Training Systems

REPORT WRITER
for DEC computers
under RSTS and VMS

- Very powerful and user-friendly
- Better than DEC's Datatrieve
- Costs much less

etc ENTERPRISE TECHNOLOGY CORPORATION

Adam's tactics:

- He showed interest in Tom as a person.
- He acknowledged Tom's unique knowledge and talents.
- He encouraged Tom to come up with ideas.
- He was accessible to Tom, but not overly forceful.
- He carefully selected the language and tone he used with Tom.

In a traditional hierarchical setting, a manager's power is his power to command. In influence situations, which by their very nature lack command, another kind of power has to be utilized. This power is based on one's own knowledge and expertise and is used to achieve collaboration.

The process that took place between Adam and Tom allowed each of them to do a better job. The ultimate output of their teaching/learning exchange, in which each widened his knowledge of the other's functions, was a higher level of decision making. Their final decision to work together was based more on fact and less on personalities and guesswork. It proved a more efficient way than exchanging irritating memos and phone calls.

The skills Adam is learning in his interactions with Tom and other managers have made him more productive. He is even being considered for a much more important position in the corporation. "I'm in the mainstream of the company now," he admitted. "There's no telling how far I can go. This never even entered my mind when I was down in the basement."

The influence process

The managerial skills on which Adam's success is based are not magical. Their foundation is the influence process, a complete and rational approach to the problems posed by today's changing business world. This process is based on the values of cooperation and collaboration to achieve overall goals.

Most managers don't know they have the influence option. They think their options are limited to giving orders or manipulating. This is not true — influence is another option. For example, Adam could have tried to manipulate Tom to get his cooperation, and perhaps he would have succeeded — the first time. But the next time around, Tom would have been more leery than ever. Nobody likes to be used and manipulated.

Adam's approach, however, was straightforward. He gave as much as he got. Chances are good that he and Tom will cooperate again in the future. As a complete system of planning and action, the entire approach Adam used represents the influence process.

Influence is a way to get results in a changing environment. As a specific management process designed and developed by The Forum Corp., a management consulting firm located in Boston, influence is based on extensive research into the work habits and interpersonal skills of more than 4,000 successful managers.

The process allows managers to succeed in situations in which they have no control over the people and resources whose cooperation and utilization are necessary to the accomplishment of their tasks.

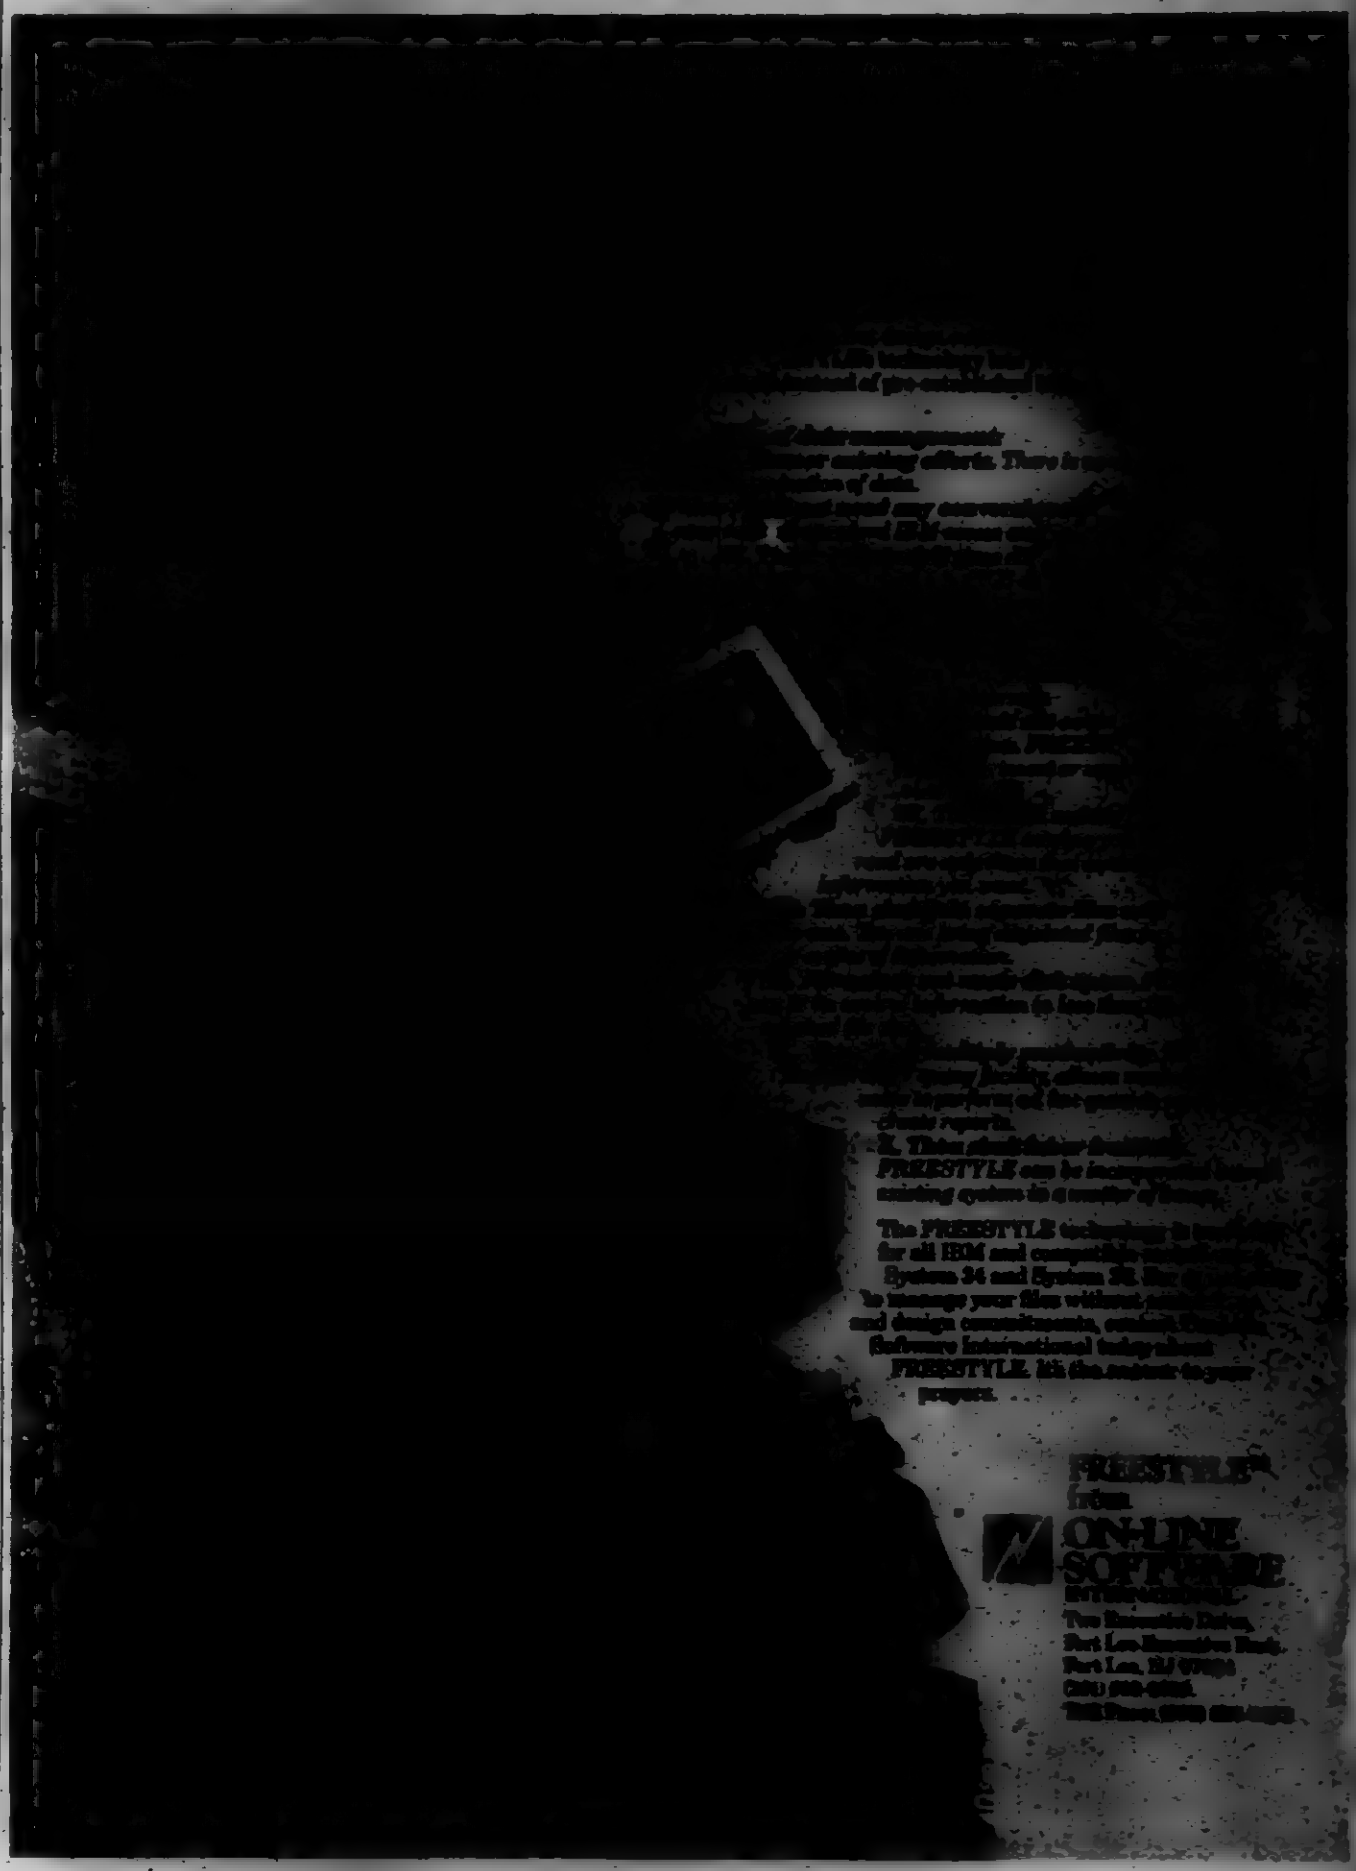
The foundation of influence behavior rests on a set of general values that are expressed by:

- Being supportive and helpful to others.
- Being willing to share power for the sake of an overall goal.
- Behaving in ways that lead others to trust you.

The influence process has three phases, which operate concurrently.

Building influence. In order to exert influence, you must first have it. The manager who builds influence does so by acting as a catalyst or initiator and by building reliable ground rules within an influence group. To do this successfully, a manager must be perceived as supporting and helping others. As a result of building influence, managers are able to make their work relationships more efficient.

Using influence. The manager who has built influence is now in a position to use it. He will encourage others to try new ideas and also provide a way to narrow down all the ideas generated to several reasonable alternatives, thereby capturing the collaborative power of



the influence group. To do this, the influence manager must also demonstrate an understanding of the importance of sharing power in the interest of the overall goal. The result of using influence in this way is that high-quality decisions are reached after a thorough examination of a wide variety of options.

Sustaining influence. The manager who has built and used influence faces the challenge of sustaining it. To do this, the individual must demonstrate an ability to get people to commit themselves to decisions and ideas, as well as remain open and flexible about change.

Underlying these traits is a fundamental method of establishing mutual trust within a network. The result of sustaining influence is the consistent execution and implementation of plans and ideas as intended.

The influence process tells people what to do and how to exert influence. The technically valid components of influence behavior are presented as precise, small-scale pieces of behavior that will cause you to be perceived as a manager who is efficient, makes creative, high-quality decisions and implements efficiently.

For example, you are leading the initial meeting of a project team composed of your peers, people over whom you have no control. Your mission is to get the project done. You have come to the meeting with a preconceived idea of how the team ought to function. As other team members express their views, you can respond in either an open or closed way.

Being closed to the opinion of others is a dead end. They cannot help but view you as a loner rather than as a team player. And if you are viewed as a loner trying to impose your preconceived view on the team, the other members will feel devalued, which leads to a lower level of their input.

If you are open, others will naturally feel free to express their ideas, which is essential to the success of any team.

Interest in others

In addition, your openness demonstrates your interest in the ideas of others, which enables them to think more creatively. The result is a genuine group effort to reach the best, most informed decisions possible. If you are able to motivate creative thinking, your mission is more likely to succeed.

But with the time pressures of your job, part of you just wants to present your ideas and get the meeting over with so you can go on to the next thing on your schedule. This behavior only tends to isolate you from the group and weaken your position in it. In the long run, this behavior is minute-wise and hour-foolish.

The most efficient use of your time is to create an atmosphere in which communication, cooperation and consensus are valued. Encourage others to express their ideas and take risks. Make sure everybody's role is clear. Arrive at agreed-upon ground rules on how the members of the team will work together.

Body language

There are specific things you can do in such influence situations. To demonstrate your interest in the ideas of others, keep the discussion going, don't close people off. Instead of fiddling with your pencil or looking out the window while someone else is talking, look into their eyes. Say a word or two to indicate your interest and keep them talking. You might move closer or smile. All of these specific actions were discovered as the result of a study of influence behavior.

The implications of the availability of influence techniques are broad. Not only are they essential in no-control situations, they are also extremely valuable in traditional hierarchical settings.

Their usefulness to MIS/DP managers makes them invaluable in one of the fastest growing areas in corporate management.

As Adam Michaels put it, "So that's what I've been doing, practicing influence. I didn't know what to call it, but believe me, it works."

CORRESPONDENCE QUALITY FOR THE CORPORATE WORLD OF THE IBM PC

Introducing the Diablo 32 CQ Correspondence Quality printer, perfectly matched to the IBM PC. It's a single printer that does everything. This remarkable dual speed machine delivers both high speed printing in draft mode and superior print quality in correspondence mode. The extended character set, combined with full graphics capability, lets you get the most from your IBM PC. And all at a surprisingly affordable price.

The Diablo 32CQ: quality you can see at the Diablo dealer nearest you. Call 800-556-1234 ext. 186. In California call 800-441-2345 ext. 186. Diablo Systems Inc., A Xerox Company, Fremont, California.

HARD TALK
Tom Henkel
CW Senior Editor

Can PCMs fend IBM's pressure?

The race appears to be on in the high-end IBM mainframe arena. IBM started things off by replacing its 3080 line of mainframes with six new processors, called the X models, which offer up to 14% more performance than the older models at the same price. The catch is, users of the older processors cannot field-upgrade to the new systems.

Now Amdahl Corp. has joined the race. The company recently announced dual- and multiprocessor versions of its 5860 processor, which offer 1.25 to 1.4 times the performance of the most powerful uniprocessor in the 580 line. At the same time, the company cut prices on its existing 580 series processors, boosted available main memory on all 580 series processors to 64M bytes and promised to offer up to 128M bytes of main memory on the processors by the first quarter of 1985.

The turn of events is simple. IBM would like to do to Amdahl what it has already successfully done to the manufacturers of 4300-compatible processors — make the firm squirm. Amdahl, as it has done in the past, appears ready to fight back.

It is probably more than coincidence that Amdahl chose to announce its new systems exactly one week (almost to the minute) after the IBM announcement. It is also not surprising that the Amdahl processors offer slightly more performance at a slightly lower price than their IBM counterparts.

The question is: How long can Amdahl keep it up? IBM has more research and development money than all of the plug-compatible manufacturers (PCM) put together. It also has the power to change the ground rules in the high-end main-

Why IBM has to replace its high-end 3420 tape drive

By James Connolly
CW Staff

For more than five years, industry watchers have been predicting that IBM is on the brink of announcing a new, advanced tape drive to replace its aging 3420 tape unit. During that time, IBM has remained silent. Many have criticized IBM, claiming the company has failed to provide its users with an adequate means for backing up disk drive data to tape. Others have found the persistent rumors of a tape drive announcement quite humorous.

Once again, rumors of a new tape drive are flying. But this time, analysts say, IBM has to make the announcement. Without the new tape unit, they say, IBM cannot announce a larger disk drive nor can it announce its much talked about Sierra line of large computer systems.

Industry observers cite the need for a new tape drive to provide effective backup to the IBM 3380 disk drive and to handle the transfer rates of processors that are two generations beyond the 3420-type tape drives.

"Two good computer life cycles have come and gone, and we still haven't seen any significant change in tape technology. Systems like the 4341 and up need tape systems that are a lot faster than they are now. The processors and disks have progressed, but the tape hasn't," said Ken Harvey, president of CSP by Ken Harvey, Inc. of Toronto.

Don Collier, general manager of the Freeman Reports, a storage system report published by Freeman Associates of Santa Barbara, Calif., said that even for currently available devices, like IBM's 3380 disk drive, the 3420-type system suffers from lack of speed. The unit is as big as a refrigerator, he said, adding that it is too expensive for its performance. He said the tape technology hasn't kept pace with disk and processor technologies.

"What is needed is something cheaper, smaller and newer. The performance of the 3420 is somewhat mismatched for the 3380. The 3420 transfers at just 1,250K bit/sec, while the 3380 is at 3,000K bit/sec," Collier reported.

International Data Corp. consultant Charles Greco likened the process of dumping a 3380 disk to a circa-1971 3420 backup to "running a Corvette in a 55 mph speed limit."

All three men said problems with the 3420-type rest not only in the transfer rates, but also in the storage capacity.

Collier said that a 3380, transferring

MAP 6420 array processor out

BILLERICA, Mass. — Computer Signal Processing, Inc. (CSPI) has announced its first 64-bit array processor, the MAP 6420, which reportedly can execute up to 7 million floating point operation/sec (flops) and comes with a Fortran compiler.

Available in August, the unit is designed for use with Digital Equipment Corp. VAX-series front-end processors.

The MAP 6420 is a rack-mountable unit 21 in. high. Initial systems will be available with between 4M and 18M bytes of main memory, but a spokesman said the MAP 6420 is capable of addressing up to 1G byte of memory. He said that in about five years the system may be able to utilize the full 1G-byte address space.

The unit comes with a Fortran-77 compiler and a library of matrix and vector functions. The unit can accommodate up to four disk controllers, each of which can manage four disk drives. According to the spokesman, various disk drives can be used on the system, but the standard device used is a 167M-byte Winchester disk drive.

The MAP 6420 with the Fortran compiler costs $100,000. The unit was designed for structural analysis, integrated circuit design and scientific simulation uses.

CSPI is located at 40 Linnell Circle, Billerica, Mass. 01821.

IBM's 64K-bit chip said to operate at 16 to 20 nsec

YORKTOWN HEIGHTS, N.Y. — Researchers at IBM's T.J. Watson Research Center here claim to have developed a 64K-bit memory chip which can operate at between 16 and 20 nsec, considerably faster than currently used chips, which operate between 70 and 300 nsec.

IBM said the chip achieves its performance through several new design concepts. These include:

- A self-timed sensing circuit that permits the chip to operate faster than conventional circuits.
- An address buffer that allows the chip to read information faster than conventional chips.
- A simpler timing technique said to reduce the number of clocks necessary to keep the chip operating properly.

In addition to faster access time, the experimental chip can discharge information in blocks twice the size of conventional memory chips. The experimental chip can discharge 16-bit blocks of information at one time, IBM said.

Another advantage of the memory chip, IBM said, is that fewer chips are required to achieve the standard 16- or 32-bit word size commonly used in many processing systems. The 64K-bit chip uses a four-device memory cell instead of the single-device cell architecture commonly used in memory chips.

The experimental chip is roughly a ¼-in. sq and is an N-channel metal oxide semiconductor, field effect transistor device. Physically, the chip consists of four 16K-bit blocks, or quadrants, of memory cells, with associated row and column decoders in adjacent blocks, IBM said.

The chip was developed at the Watson Research Center and was fabricated and tested at IBM's General Technology Division located in Burlington, Vt.

The central intersection of IBM's experimental chip magnified 400 times.

SYSTEMS & PERIPHERALS

PROCESSORS

DIMIS, INC.
Total 100

Dimis, Inc. is now marketing its Total 100 computer system as an upgradable starter system for wholesale distributors. The system features the Modular Computer Systems, Inc. Classic II superminicomputer with 512K bytes of memory, an 80M-byte storage disk, a streaming tape drive and a 300 line/min printer.

The system also comes bundled with two CRT terminals and a document printer or with three CRT terminals, the vendor said. Installation, training and software for applications such as sales analysis, pricing service and billing are all included in the system's $75,000 price.

Dimis, P. O. Box 2283, Ocean, N.J. 07712.

DATA STORAGE

APPLIED DATA COMMUNICATIONS, INC.
Series 4000 Initialise/Copy System

Applied Data Communications, Inc. has announced a robot-fed floppy disk copy system that formats and copies both sides of a disk at once. Output data formats are held in memory separate from replicated data.

The Series 4000 Initialise/Copy System comes with a robotic disk

PCM from page 79

frame market overnight.

And perhaps most importantly, IBM is making so much money that it can afford to shave a little off its profits on big systems to hurt the competition.

But let's put the marketing games aside for a moment. Users of high-end mainframes pay a lot of money for CPUs. This is a marketplace where systems start at $1 million. If, by the flip of a circuit board, IBM can make major corporate investments as worthless as scrap metal, who is really getting hurt?

Given its power and resources, IBM could easily squash a company like Amdahl. But must users be the pawns in IBM's power plays? In many ways, IBM is already the only game in town. Owning better than 70% of the worldwide mainframe marketplace, many users are so deeply committed to IBM's systems software that a conversion to another vendor's line of mainframes is simply impossible.

For many, the only alternative to IBM has been the PCMs. But the PCMs appear to be dying off at an alarming rate. Magnuson Computer Systems, Inc. wound up filing for protection from its creditors under Chapter 11 of the Federal Bankruptcy Act. Control Data Corp. dumped its Omega line of 4300-compatible processors. IPL Systems, Inc. is hurting. Smaller firms like Cambex Corp. appear to be barely surviving. The only makers of IBM-compatible systems that have been profitable are those competing against the upper end of IBM processors. Now IBM appears bent on making companies like Amdahl and National Advanced Systems, Inc. squabble for smaller pieces of the mainframe pie.

Is IBM going to take over the world? Right now, it appears to have the power to do so. But even if it succeeds in killing off its competition, IBM is big, bureaucratic and conservative. There will always be room for new vendors offering new ideas. Perhaps what has hurt the PCMs more than IBM's hell-bent devotion to destroying them is the PCM firms themselves. Companies that started out as entrepreneurial firms became big, bureaucratic and conservative — basically smaller versions of IBM. Playing a game of one-upmanship with IBM on a product level is one thing, but emulating IBM corporate structure is not a good idea. Indeed, if anything ever does IBM in, it will be its almost uncontrollable size.

For the PCMs, survival depends on getting back to basics. A "me too" product line just will not make it. The PCMs have to come up with innovative products that happen to work in an IBM environment. And they have to be more aggressive about it.

TAPE from page 79

data uninterrupted, can fill a 2,400-ft tape in 144 seconds. But he said that normal interruptions bring that time up to five or 10 minutes.

When that tape is full, a technician, if standing by, spends at least 30 seconds replacing it, a process that must be done at least 14 times in more than an hour of copying a 3.2G-byte disk onto backup tape, Collier said.

Harvey said that one drive that has exceeded the 3420's overall speed is the plug-compatible Storage Technology Corp. 4800 tape drive with cache memory. But he stressed that IBM and plug-compatible manufacturers haven't taken the lead in developing a tape subsystem that keeps pace with the high-end disk drives.

Greco blamed the delay on technical problems, such as developing an effective read/write head and dealing with the "starting and stopping" of the read/write process. He also cited the possibility that IBM is letting its plug-compatible competitors, known for copying IBM's innovations, suffer.

Collier cited the technical problems and IBM's emphasis on disk technology.

But even when the 3420 replacement is announced, it could be outdated, Harvey noted. "The product people are waiting for will be an instant compromise. It won't be fast enough, and it will still be less than 300M bytes, which is a basic and fundamental flaw. It will still need three cartridges to dump one 3380," Harvey said.

The consultants agreed that a new product could fall further behind if IBM increases the density of its disk drives and that the use of other media, such as smaller disks, for backup would be too expensive for most companies.

Greco predicted that a new IBM drive would result in "massive conversion efforts."

Greco, Harvey and Collier said any new product is likely to use cartridges rather than reel-to-reel tape.

Only Lee Data's Universal Terminal System can satisfy all of your information processing needs... 3270, Async and personal computing.

Finally, there's a single, universal way to satisfy the individual information processing needs of all your people. From sales manager to accountant. From research to production. The Lee Data Universal Terminal System can do it all.

And our system is modular by design to provide you any or all of these cost-effective, problem-solving advantages:

3270-compatibility plus more

Combine complete 3270 system-compatibility with an innovative Lee Data design and you have a System that delivers greater convenience and flexibility.

Our System not only offers standard 3274-compatible local and remote control units, but now also provides combination local/remote controllers with a unique dual-host access capability.

In addition, you can choose from a full line of terminal capabilities, beginning with our cost-effective 3178-compatible display on up to our popular All-In-One Display which offers, in a single unit, four selectable screen sizes—including 132-column—a great advantage in program development, spread sheet applications and many others where flexibility is required.

3270-plus-Async: another cost-effective advantage

If your application needs currently find you switching between 3270 and VT100-style terminals to get the job done, Lee Data has a better way.

As part of our System, you can enjoy the further advantage of a 3270/Async capability that allows dynamic selection of 3270 and VT100 operating modes from a single Lee Data display. A simple command entered at the keyboard provides you access to applications running on an IBM CPU, non-IBM systems (such as DEC, H-P or Prime), as well as timesharing services. Another Lee Data solution to simplifying your company's terminal network.

And now integrated personal computing too

That's right! Now our System also includes a sophisticated personal computing package that can easily be integrated into an existing Lee Data 3270 system.

With our approach, you get continued interactive access to host-based files, plus all the advantages of professional business computing from the same Lee Data workstation.

Advanced features include a host file transfer capability, a single-board design, four standard system expansion slots and, of course, complete IBM-compatibility.

All these additional capabilities plus the same user-friendly Lee Data displays.

Plus these added benefits...

To any Lee Data System, add our unique Coax Eliminator products and realize additional savings of up to 85% in cabling costs alone.

Combine this with all the outstanding features already mentioned and you'll find a System offering everything you need for efficient, cost-effective operation.

Discover the advantages of our Universal Terminal System for yourself. For more information, call our system specialists toll free:

handler as a front-end subsystem. Total copy time for 5¼-in., double- or single-sided, 48 track/in. diskettes is 21 sec/disk. Double- or single-sided, 8-in. diskettes take 39 sec/disk, the company said.

The unit has the ability to generate copies for over 300 different target system formats, the company noted, and includes error checking techniques and read-after-write testing. Security is provided by a number of copy-protection schemes including coded serial nubers, scrambled sector headers and logical traps.

Series 4000 systems are priced from $29,000, depending on configuration.

Applied Data Communications, 14272 Chambers Road, Tustin, Calif. 92680.

ALSPA COMPUTER, INC.
HD series

Alspa Computer, Inc. has introduced modular hard disk drives that are plug-compatible with any of the company's network workstations and computer systems.

The HD series is available in 10M-, 20M-, 35M- and 50M-byte versions and can be used to expand the storage capacity of an entire Alspa-Net local-area network and to distribute storage capacity throughout the network, the company said.

The vendor said the only expansion costs are for peripheral hardware and cabling. Extra communications lines do not need to be added.

The HD-5010, with 10M bytes of storage, is priced at $2,495; the HD-5020 (20M bytes) costs $3,495; the HD-5035 (35M bytes) costs $4,495; and the HD-5050 (50M bytes) costs $5,495.

Alspa Computer, 477 Division St., Campbell, Calif. 95008.

VERMONT RESEARCH CORP.
Model 83AA

Vermont Research Corp. has announced a 44M-byte disk subsystem for use with the Sperry Corp. V-77 minicomputer and the Sperry E-bus.

The Model 83AA was designed for use in difficult environments, with an operating range of zero to 50° Celsius.

The system reportedly consists of two removable cartridges and two fixed disks, each with 9.66M bytes of formatted storage allowing for self-backup; a controller; power supplies; a mounting enclosure with cooling fans; and hardware for 19-in. equipment racks.

It is said to perform formatting, format verification, block scanning, bad block checking and display and firmware track sparing.

The subsystem is available for OEMs and end users 10 weeks after receipt of order. It is priced at $13,225 per system in quantities of 50.

Vermont Research, Precision Park, North Springfield, Vt. 05150.

CIPHER DATA PRODUCTS, INC.
GCR Cachetape

Cipher Data Products, Inc. has announced a line of 6,250 bit/in. group-code-recording (GCR) tape drives designed to meet the storage requirements of 32-bit computer systems manufactured by such companies as Digital Equipment Corp. and Data General Corp.

The first models in the GCR Cachetape line, Models M991 and M990, reemploy the vendor's ½-in. tape interface for hardware integration plus the vendor's cache technology for system software compatibility.

The M990 features a cache size of 128K bytes and a maximum transfer rate of 450K byte/sec. The M991 has a 256K-byte cache size and a 790K byte/sec maximum transfer rate, a spokesman said. The maximum block size is 32K bytes for the M990 and 64K bytes for the M991.

The M991 reportedly features downstream erase, which eliminates tape repositioning on write error retries, according to the spokesman.

The models provide up to 180M bytes of data storage on a single tape reel. This capability reportedly allows the M990 to support the backup of a 500M-byte Winchester disk drive with less than three reels of tape.

The M990 will be available after June, and the M991 will be available three to four months later.

The drives will be available in OEM quantities. The M990 will be priced between $6,000 and $7,000, and the M991 will cost between $7,000 and $8,000.

Cipher Data Products, 1800 Embarcadero Road, Palo Alto, Calif. 94303.

SYMBICON ASSOCIATES, INC.
CT-5654

Symbicon Associates, Inc. has announced a self-contained processing system designed for use as a controller with up to four 3M Co. HCD-75 cartridge tape systems.

The CT-5654 is said to feature read-only memory (ROM), programmable ROM and I/O features built around an Intel Corp. 8089 I/O processor.

It reportedly uses a dual-bus architecture to allow the I/O processor to communicate with on-board devices over a 16-bit local bus and with the host system over the Intel Multibus.

The Intel 8089 reportedly performs all disk and tape control, error correction, retries and direct memory access control and executes user-written programs from system memory or from local ROM.

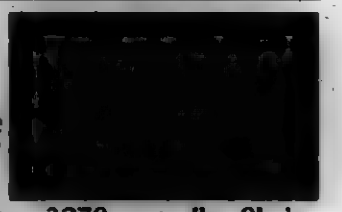
The controller is available to OEMs and end users now for $910, the company said.

Symbicon Associates, 39 St. 101A, Amherst, N.H. 03031.

She's Director of Decision Support, the leader in IBM 3270 mainframe/PC networks.

IRMA is taking charge! Her performance in over 25,000 IBM 3270 mainframe/PC installations has made her the industry's leading Decision Support Interface.™ Why? Because IRMA works. Easily and economically, IRMA's on the job giving PC users mainframe data access, selection, storage and communication back to the mainframe.

She's more capable than ever.



IRMA is a printed circuit board that slips into any available IBM PC/PC XT slot and attaches via coaxial cable to a 3270 controller. She's as easy to work with as the PC itself and provides standard text file transfer software

SYSTEMS & PERIPHERALS

TERMINALS

PRITECH
GTC314

Pritech has announced a color graphics terminal said to offer bit-mapped display, a 4,000-color palette and programmable character sets.

The GTC314 features a 512- by 480-pixel resolution display. Utilizing a Tektronix, Inc. 4027-compatible protocol, the graphics terminal can display arcs, circles, pies, vectors, bars and polygons. Also, a Tektronix 4010 emulation mode permits use of software such as the Tektronix Plot 10, Isaco, Inc.'s Disepla and Tellagraf and Precision Visual, Inc.'s DI 3000.

Other features include dual-processor architecture, a detached keyboard and optional tilt-and-swivel stand. The GTC314 costs $2,850 and includes two RS-232C ports said to operate at speeds up to 19.2 bit/sec.

Pritech, 16902 Von Karman, Irvine, Calif. 92714.

PRINTERS/PLOTTERS

DIGITAL EQUIPMENT CORP.
LVP16

Digital Equipment Corp. has announced a color graphics pen plotter designed for use with its line of microcomputers and its VAX series superminicomputers.

The LVP16 reportedly draws on plain paper or transparencies and offers a palette of 10 colors with a choice of six for paper and seven for transparencies. It is said to accept standard U.S. and European paper and transparency sizes, to feature .001-in. accuracy and to offer a maximum speed of 15 in./sec.

The plotter features software control of the pens and a view button that allows the user to interrupt the plotter while it is operating. It also is said to allow eavesdropping, where connecting the plotter and a printer to a host frees the host for other communications needs.

The unit is available now at a price of $1,995. Interface kits cost $40 for the DEC Rainbow personal computer and VAX-11 and $35 for the Decmate and Professional series microcomputers. The eavesdrop cable for serial printer connection is priced at $75.

DEC, Maynard, Mass. 01754.

GRAPHICS SYSTEMS

PARAGON TECHNOLOGY CORP.
Series 200A; Series 300

Paragon Technology Corp. has announced that the CPU for its Model 200 computer-aided design system has been upgraded from 16 bits to 32 bits.

The upgrade, Series 200A, was designed around a 15-MHz Digital Equipment Corp. LSI-11/73 processor.

It offers an independent, 16-bit proprietary graphics processor, a company spokesman said. The system has up to 512K bytes of memory and reportedly enables the user to design complex boards that contain up to 64 layers and 1,000 equivalent integrated circuits and measure up to 32 by 32 in.

Pricing for the Series 200A upgrade is $3,000. The Series 200 is priced at $59,950 in single-unit quantities.

The company also has introduced another system, the Series 300, a 32-bit, network printed-circuit board, color computer-aided design and manufacturing system.

The Series 300 features a 32-bit DEC LSI-11/73 CPU with an associated video display console called the Network System Manager (NSM), the spokesman said.

The NSM reportedly links up to 16 of the vendor's Model 301 and/or Model 302 graphics workstations in any combination over a fiber-optic local-area network with a maximum length of one kilometer, the vendor said.

Each workstation consists of a CPU, a 16-bit graphics processor, a video display console and keyboard and a 14- or 19-in. color monitor. The system comes with a set of applications software, according to the spokesman.

Prices for the Series 300 NSM start at $35,000.

The Model 301 graphics workstation is priced at $32,500, and the Model 302 graphics workstation costs $37,500.

Paragon Technology, 2129 Nurse Drive, Pleasant Hill, Calif. 94523.

for VM/CMS and MVS/TSO mainframe environments, in addition to optional APL Terminal Emulation.

KS series

KEC Electronics, Inc. has added the KS series of multi-output units to its line of switching power supplies.

Available in 100W, 130W, 170W, 200W and 300W models, the units incorporate various output voltage combinations.

In addition, the outputs can be modified to suit special applications, the company said.

Unit prices range from $186 for the 100W model to $365 for the 300W model. Quantity discounts are available.

KEC Electronics, 20617 Western Ave., Torrance, Calif. 90501.

BOARD-LEVEL DEVICES

NATIONAL SEMICONDUCTOR CORP.
BLX-218

National Semiconductor Corp. has announced the BLX-218, a floppy disk controller board that is said to be capable of supporting up to four 8-in. or 5¼-in., single- or double-sided disk drives.

The BLX-218 expansion module is the latest addition to the firm's Series/80 family of Intel Corp. Multibus products. The units are compatible with any board utilizing the BLX on-board I/O expansion interface, the company said.

The BLX-218 supports IBM 3740 single-density, IBM System/34 double-density or other formats with sector lengths up to 8K bytes. It also performs operations in either single or mulitple sectors and has on-board data separation logic performing data encoding and decoding. In addition, it operates in either direct memory access (DMA) or non-DMA environments, the company noted.

The controller board is available for $493 in single quantities.

National Semiconductor, 2900 Semiconductor Drive, Santa Clara, Calif. 95051.

CYBERCHRON CORP.
CVM-5030

Cyberchron Corp. has announced a 1M-byte add-on memory card for the Digital Equipment Corp. VAX-11/750, VAX-11/730 and VAX-11/725 superminicomputers.

The CVM-5030 is packaged in a single hex-size module and is now available. It reportedly features 64K bytes of dynamic random-access memory and additional error check and correction bits to permit correction of all single-bit errors and most multiple-bit errors.

The memory enhancement is said to include an on-board switch that allows the memory to be taken off-line for diagnostic purposes without removing the card. It was designed for full plug-compatibility with the DEC M8750 add-on memory expansion module.

The price is $1,995.

Cyberchron Corp., P.O. Box 196, Garrison, N.Y. 10524.

SPECTRA LOGIC CORP.
Spectra 120

Spectra Logic Corp. has announced Spectra 120, a single-board storage module drive disk and ¼-in. tape controller for Data General Corp. Nova and Eclipse minicomputers.

The system features 35 sectors, increased sector buffering, compatibility with Federal Communications Commission standards and drive configuration through a single programmable read-only memory, according to the vendor. Spectra 120 attaches up to eight formatted, ¼-in. tape drives or four removable-pack or Winchester disk drives, the vendor said.

The product costs $4,800.

Spectra Logic, 1227 Innsbruck Drive, Sunnyvale, Calif. 94089.

HYBRICON CORP.
4-3010C-VHF

Hybricon Corp. has introduced a socket board that will provide a 22% increase in available board space over the firm's earlier products. The unit was designed for use with Intel Corp. Multibus systems.

According to the vendor, the 4-3010C-VHF allows the designer to place more circuitry on one board and combine analog and digital functions in one place.

The board can hold up to 168 16-pin, dual inline packages. The top I/O on the board will accept two 50-pin and one 40-pin ribbon cable connectors.

The price is $405 in single and small quantities. Delivery is within two to four weeks.

Hybricon, 410 Great Road, Littleton, Mass. 01460.

AUXILIARY EQUIPMENT

NIKON, INC.
Microplan II

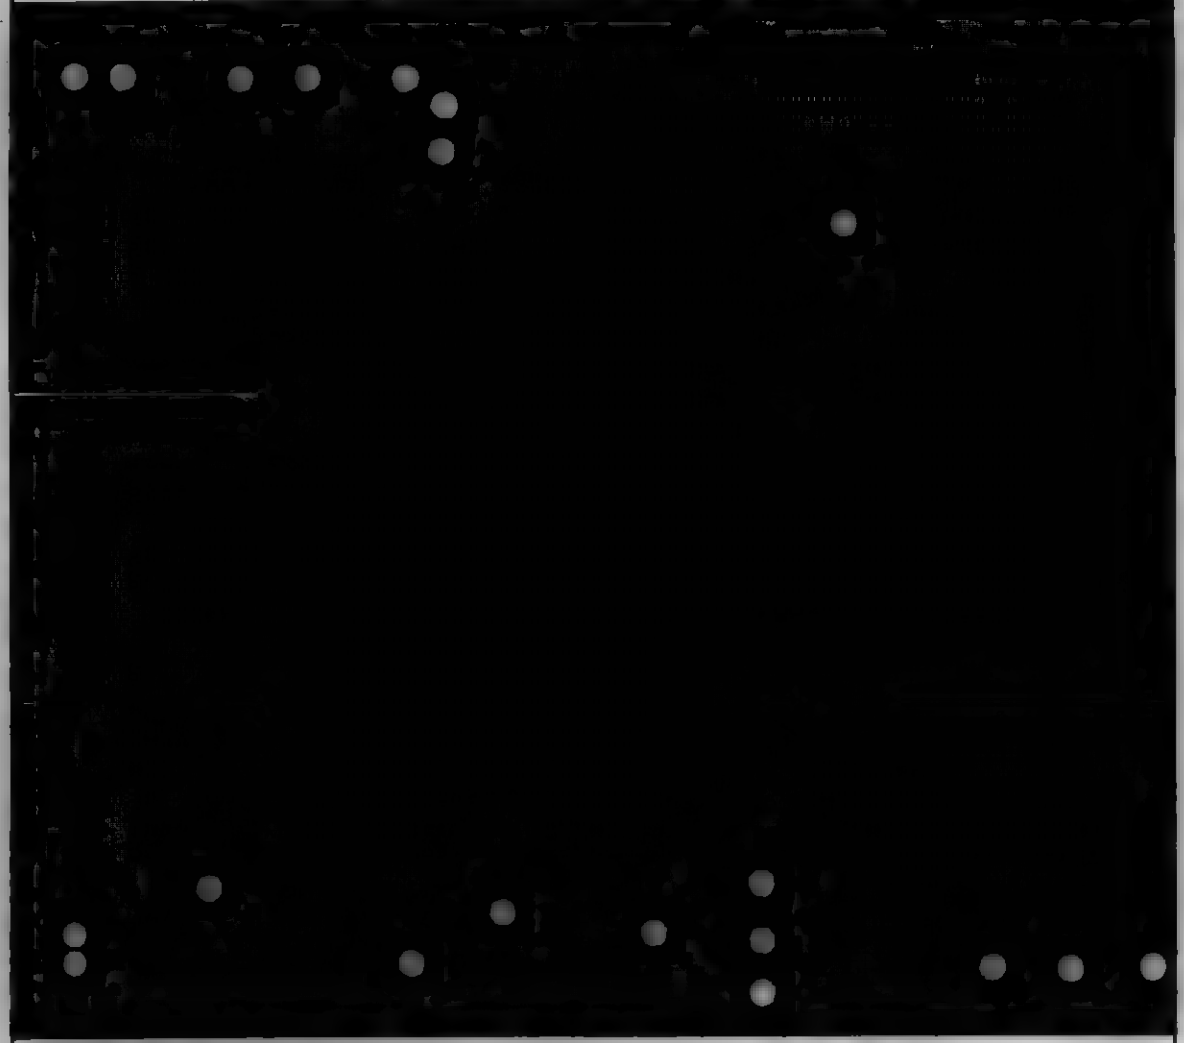
Nikon, Inc. announced Microplan II, a two-dimensional image processing system.

Microplan II includes a digital planimeter, which measures distances in two dimensions rather than one; a microprocessor; and an 80-col. dot matrix printer. The system can be used with any microscope to determine particle sizes, counts and distributions, the vendor said.

A digitized pen version of the system costs $4,165; a system with a five-button cursor sells for $4,500.

Nikon, 623 Stewart Ave., Garden City, N.Y. 11530.

TIME



Making yourself memorable.

You don't have to be a giant in the industry to attain a leadership position. Just having your name among the leaders can make a noticeable difference.

Your advertising presence in TIME Magazine can do more than gain you the attention and interest of the business community. It can position you among the major companies who already know the value of reaching greater numbers of purchasing influentials with greater visibility.

TIME's audience offers you both selectivity and reach – with the right demographic and geographic patterns for increasing your share of market as well as building awareness within the business and financial communities, and among your dealers. Being in the world's foremost news magazine puts you in the main arena. And TIME has specific demographic and geographic editions to accommodate your budget and implement your marketing strategy.

Your reputation is probably the most important element in your continued growth. Now that you're making a name for yourself in the industry, perhaps it's time to make more of your name.

To learn more about how you can use TIME and its various editions, call Charles Craig at (212) 841-2831.

TIME

Get more out of it.

What three letters represent the most powerful on-line computer in business today?

TX

The most powerful on-line

Time was, the answer to the previous page was as easy as ABC.

But that was yesterday.

Today, the world of business computing is being introduced to a system featuring over two-and-a-half times the performance and twice the price/performance of its nearest competitor.

A versatile system. Able to compile the information of the largest corporations into a single relational data base. Instantaneously updated and fully available across the entire system.

An expandable and compatible system. Allowing the simple addition of future programs and equipment, without sacrificing past investments.

And most importantly, a system that won't let you down. Because its fault-tolerant design won't let itself down. Even if a major component fails.

This system isn't from IBM.

It's from Tandem.

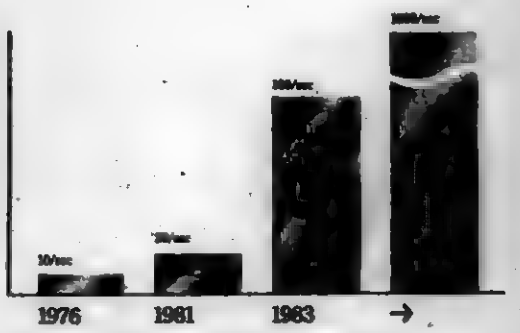
Introducing the NonStop TXP™ system.

TXP: 32-bit transaction processing.

The TXP system processes high volume loads faster and more economically than any other system. Executing over 100 transactions per second now and thousands of transactions in the near future.

It's built around multiple parallel 32-bit processors. Each addressing 16 MB of physical memory and over a gigabyte of virtual memory.

To help memory keep pace with that kind of processing, TXP pulls 64 bits on each memory access.



Our success can be summed up in a second. *Transactions per second. Numbers unsurpassed in the industry. On-line systems that fit your needs today. And tomorrow. With more processing power on the way.*

The TXP system also features parallel data paths. Manipulating 32 bits of information in a single cycle, two 16-bit operations in the same cycle.

And TXP incorporates extensive pipelining, to process multiple instructions simultaneously. Each processor overlaps instructions in three levels: Fetching one, while preprocessing a second, while executing a third.

While helping TXP deliver full 32-bit power, for less.

Cache memory pays off in faster response times.

Cache memory is a high-speed data storage area between the processor and main memory. It lets the processor store more frequently used information closer. So it can get to it faster.

And our tests have shown that the TXP cache memory has a 98% "hit rate." Which means the requested data is virtually always nearby for fast access.

The result? Larger volumes of work can be processed in shorter amounts of time. Helping TXP to be even more productive.

Making cache memory pay big dividends.

A system you'll expand, not disband.

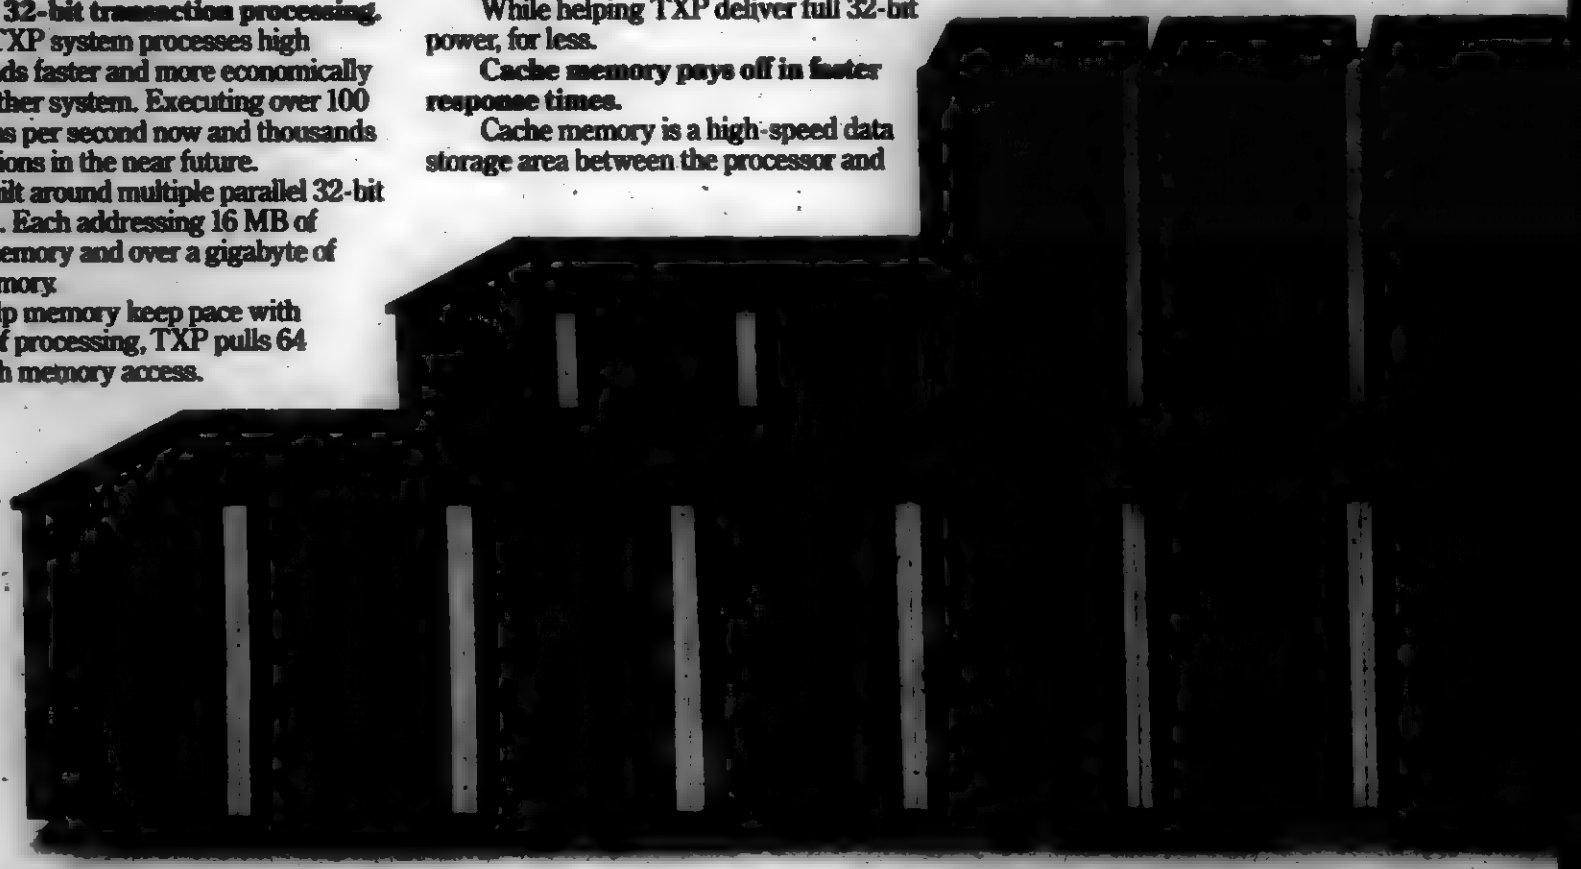
Most computer systems have very limited expandability. So if a company outgrows its computer's capacity, it usually means starting again from scratch.

Selecting and buying a larger and more expensive system.

Then reprogramming.

Then re-training.

Plus all the chaotic disruption and



XP

computer in business today.

massive loss of revenue that's unavoidable during the switch-over.

Not so with the TXP system.

It can expand from two to 16 processors. Increasing its power by a factor of eight.

That's more power than any of the largest mainframes.

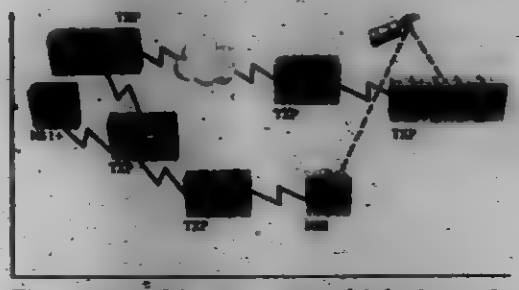
And the additional processors can be installed while TXP is running at full speed. No downtime. No reprogramming.

Still not enough power? Up to 14 TXP systems can be joined together by high-speed fiber optics. Linking the systems together as one computer with 224 processors.

But that still isn't the full potential of the TXP.

TXP systems at up to 255 sites can be joined in a worldwide network. Generating the power of over 4,000 processors.

And that gives TXP the most powerful on-line computer capacity in business.



The most powerful computer network in business today. *Users access a single unified global data base from any of thousands of terminals anywhere in the system.*

Expandability our competition wishes they could disband.

NonStop™ system compatibility from the people who started it all.

TXP can process more information and support more programs, users and devices than any other computer designed for on-line transaction processing.

Devices you most likely already have. Even devices made by IBM.

But what if your company isn't quite ready for the TXP system's awesome power?

We suggest the Tandem NonStop II™ system. The second most powerful on-line computer in business today. The cost effective solution for medium to large corporations.

What if your company is somewhere between a Nonstop II and a TXP?

No problem. They can be combined. They can share the same data and programs. In fact, NonStop II and TXP processors can coexist in the same cabinets.

And what if your company needs even a smaller computer? We make a smaller computer. The Tandem NonStop 1+ system. Perfect for those low-volume sites where less processing power is needed.

Tandem literally wrote the book on NonStop™ transaction processing. That's because we introduced the first NonStop system.

Over eight years ago.

And for over eight straight years, despite attempts by others, we've continued to lead the industry.

Learn all about TXP, ASAP.

For complete literature, contact your local Tandem Sales Office.

Or write Tandem Computers Incorporated, 19333 Vallco Parkway, Cupertino, California 95014.

Or call us, toll-free. (800) 482-6336.

TXP is the most powerful on-line computer in business today.

Without question.

The ta… formation from IDC's … Session on two easily … Conference Journal Cas… … ULTAK and CW Communications

What eight emerging technologies will revolutionize the office of tomorrow? Will the ARPANET breakup change the course of telecommunications? What's next for personal computing?

For the answers to these and many other critical questions, don't miss IDC Computers the Future, your two-cassette conference journal program of interviews featuring a distinguished panel of experts from the International Data Corporation family of information technology companies.

In Part I, Vice President Bill Hodgman and Tom Willmott discuss the impact of new technologies on the evolving office, both today and tomorrow. Thane Hall Hickman, IDC's graphics expert, gives you an insider's view on the state of computer graphics. In Part II, noted hi-tech author John Gantz plays Socrates with Zachmann to shed exciting new light on the future of personal computing.

But here's the best part. You and your associates can "attend" these lively information video conferences over and over again at your leisure. The entire 90-minute tape of your Office Conference Journals, still [illegible] for $49.95. To [illegible] (303) [illegible]

MICROCOMPUTERS

Need for micro shopping questioned

By Paul Kerzaniowski
CW Staff

NEW YORK — "In the business world, computers and vendors in place tend to remain in place," Donald Smith, president of MH Financial Management Systems, Inc. here said recently.

"Now, one might expect that since personal computers are a new phenomenon, that market will be open to careful consideration and comparison shopping."

But comparison shopping plays only a minor role in corporate microcomputer purchases; Smith told a seminar on "The PC Revolution in Business," sponsored by *Fortune* magazine.

"The current mainframe vendor has a head start and an entrenched position," he explained. "It is not easy for one vendor to displace or even gain a toehold on another. The sales force of the vendor presently in place is a powerful agent for the current vendor. A comfort level with the current vendor will overcome all but the most glaring product weaknesses," he said.

While some may question an allegiance to a vendor, Smith said he thinks it has advantages. "New vendors frequently fail to perform according to their promises and sometimes fail completely," Smith said.

MH Financial Management Systems is a subsidiary of Manufacturers Hanover Trust Co., which developed a plan to control the purchase of microcomputers. The company has already purchased 200 microcomputers, and Smith projected that it will purchase 350 microcomputers before the end of the year.

First, Manufacturers Hanover Trust determined how computers are used. "Simply, every act performed within the business relates to corporate records stored on a data base," Smith said. Manufacturers Hanover Trust divided these acts into three categories. First, there is data capture, which ensures the accuracy and currency of data. Another use is data-base inquiry for reporting. Third, knowledge workers use a computer for analysis and statistical evaluations to determine the health of the company.

Manufacturers Hanover Trust limited its micros to two brands of personal computers: IBM and Wang Laboratories, Inc. "We have IBM mainframes; IBM was a logical choice," Smith said. A number of departments were using Wang VS100 superminicomputers for word processing, so the Wang Professional was also chosen. "Right now, we are a two-vendor shop, but that could change," Smith said.

After deciding which brands of hardware to use, the company determined how to distribute personal computers. "All requests for personal computers are approved by user senior management and acknowledged by the office automation group," Smith said. "In response, office automation formed a separate personal computer unit to focus on the task."

Purchases are made at an in-house computer store. "The store is a learning center in which demonstrations and tutorials are conducted," Smith said. "Manuals are

Can't take the heat? Avoid micro software mart

By Lynn Haber
CW Staff

SAN JOSE, Calif. — The microcomputer software industry is gearing up for intense product and marketing competition, and companies are already vying aggressively for future positions in the next major market battleground — new-generation software, sales of which will reach $6.5 billion by 1988, according to a report recently released here.

According to the report, titled "Integrated Software," published by Creative Strategies International, Inc. (CSI), new-generation software — both integrated software and the new operating environments typified by the "mouse and window" systems, such as Apple Computer, Inc.'s Lisa and Visicorp's Vision — will rapidly become the standard. Many companies fear that the integrated products will absorb so many of the future markets that there will be little room left for standard single-application software packages.

After 1986, sales of integrated software packages will be eclipsed by new operating environment shipments, which CSI forecasts to grow at a compound annual rate of nearly 250% through 1988. By that year, integrated software sales will be growing slowly, while sales of operating environments will still be taking off.

New product entries will be coming quite rapidly, and market shares can change quickly. CSI sees a software shakeout approaching, as leaders gain in the main markets.

What follows are the emerging trends for new-generation microcomputer software as highlighted in the report:

■ Standard new-generation software by the end of the 1983-1988 forecast period. Almost every microcomputer system will be able to address several hundred thousand characters of random-access memory, and nearly all will be able to

MICRO BITS/Thomas W. Madron

Nonstandard operating system seen as roadblock

The advent of generalized microcomputer disk operating systems software houses, such as Digital Research, Inc. and Microsoft, Inc.—whether large or small — should no longer produce hardware-specific software.

When software is associated with an operating system rather than with a specific manufacturer's hardware, it is probably more difficult, initially, to market the product. Especially with the success of the IBM Personal Computer, software houses have attempted to capitalize on the IBM image in order to sell programs. Thus, we see numerous advertisements for IBM this and IBM that.

The advantage of such a marketing approach is that the novice user has some right to assume that the program will function on the specific machine advertised. The disadvantage is that even though the program may run on other equipment, it is clearly a gamble to make that assumption. More of a disadvantage is the tendency of hardware-specific software to encourage hardware manufacturers to produce and maintain proprietary disk operating systems.

Radio Shack, with its various models of TRS-80 microcomputers that are based on Zilog, Inc.'s Z80 microprocessor and proprietary TRS-DOS, is perhaps the "best worst example."

Because Radio Shack was an early entry into mass microcomputing, and because at one time it was one of the dominating forces in the market, Radio Shack was able to maintain use of TRS-DOS even when it became clear that many TRS-80 users were interested in using Digital Research's CP/M. It was only after Radio Shack lost its foothold in the microcomputer market that it decided to make CP/M available on its Z80 systems. Several of the TRS-80s may have found greater acceptance as business machines had Radio Shack adopted a more standard approach at an earlier date.

With the obvious popularity of 16-bit machines, especially those using the Intel Corp. 8088 or related microprocessors, we seem to be redoing past history, this time with the IBM Personal Computer. The unfortunate thing that makes the proprietary approach different from IBM's is that Radio Shack was never in a position to be a vertical monopoly in computing.

Although IBM's PC-DOS operating system for the Personal Computer came first, it is clearly turning out to be a subset of Microsoft's MS-DOS. Microsoft's development of the two operating systems seems to be in favor of compatibility, and we can hope that IBM will let that development take place. At the present time, it appears that any program written for MS-DOS will run under PC-DOS.

The war is not yet won, but it is clear that Microsoft's MS-DOS has the opportunity to become the industry standard for 8088-based systems, just as CP/M became the industry standard for Z80 systems.

However, Digital Research has not yet thrown in the towel. Its Concurrent CP/M may develop into a competitive product. It is also possible that many users will be forced to use CP/M for some applications and MS-DOS for others, although most major software houses seem to be making their products available for both operating systems.

Applications software houses, as well as consumers of microcomputer products, should probably pressure both Microsoft and Digital Research to adopt some joint standards, but without expecting the two firms to make their two operating systems the same.

Incompatibility, of course, can also be encouraged by hardware manufacturers intent on acquiring marginal profits. The decision by Digital Equipment Corp., with its Rainbow 8088-based system, to use

Hewlett-Packa surge in office

Introducing the Person

The principle is simple. Boost the productivity of individual PCs. Your people, your department, even your entire company will follow suit.

The first boost occurred when we introduced the touchscreen HP 150 as an office and managerial workstation. This made personal computing so much easier and faster that individual productivity soared.

Now the Personal Productivity Center combines the flexibility of the HP 150 with the power of our HP 3000 family of distributed computer systems.

You can shape each Productivity Center just the way you want it by adding other office and computing products from our extensive range.

You can link managerial and secretarial work stations. Create impressive presentations, merging business graphics and word processing. Store them on large disc files. And print them out on laser printers and color plotters.

Your PCs also grow more productive by increasing the range of software they can run. In addition to leading PC programs like 1-2-3™ from Lotus™ and popular word processing packages, they can use HP 3000 business software like our exclusive DeskManager. This combines electronic mail, quick memo

rd touches off a productivity.

al Productivity Center.

writing, personal filing and calendar functions. And each PC can access data processing systems and large corporate data bases.

Personal Productivity Centers can communicate with similar networks in other parts of your company, as well as your mainframes. Each system can expand to handle more than 100 workstations. And you can grow without involving your programmers in any software conversion.

So if PCs alone are making your people more productive, just wait till you see them all working together. And you can see them right now by calling your local HP sales office listed in the white pages. Or write for complete information to: Hewlett-Packard, Dept. 03191, 19447 Pruneridge Avenue, Cupertino, CA 95014. In Europe, contact Henk van Lammeren, Hewlett-Packard, P.O. Box 529, 1180 AM Amstelveen, The Netherlands.

It could turn your whole company into a productivity center.

Productivity. Not promises.

GET THE WORD ABOUT TRANSACTION PROCESSING. IT'S IN THE BOOK.

In our free 82-page book, "SYNAPSE TRANSACTION PROCESSING. SYSTEM OVERVIEW." And it's a revelation. To non-technical management, technical management, and staff alike.

It spells out how to accelerate development and minimize maintenance of high-performance, fault-tolerant, online transaction-processing systems.

It also discusses miracles: how to get dazzling performance from a Relational DBMS and how to expand a transaction-processing system online under power.

It reveals how to provide fault tolerance without redundant hardware and without programming. How to use a system-wide dictionary to standardize and control all definitions and relationships. How to completely automate database integrity, concurrency and recovery.

It's all there. Chapter and verse. Even a comprehensive index. To get your copy, simply mail the coupon or give us a call at (408) 946-3191. And let there be enlightenment. Synapse Computer Corporation

Protact targets DEC micro

HOBOKEN, N.J. — Advanced Systems Concepts, Inc. has announced the extension of its integrated-applications control package for Digital Equipment Corp.'s Professional 300 series microcomputer. Called Protact, the product provides terminal, file and network management for the Professional 300.

Protact allows one or two users on a Professional to access applications that may be on a local or remote Professional, PDP-11 or VAX processor. Protact's terminal manager presents a form to be filled in by the terminal user. Primary edit checks, specified by the programmer, are verified as the user enters each field.

Several implementations of Protact are available. The Protact Developer's Kit enables users to write and implement applications on the Professional. The Protact Run-Time System consists of the Protact components used while an application is executing. The Terminal Server has terminal and network management components for use in a Xerox Corp. Ethernet local-area network.

Protact runs on DEC's P/OS V1.5 and V1.7 operating systems. The Developer's Kit costs $2,500, the Run-Time license is $395, and the Terminal Server is $595. Multiple CPU discounts are available. Advanced Systems Concepts is located at 22 Hudson Place, Hoboken, N.J. 07030.

MCBA's general ledger tool out

MONTROSE, Calif. — MCBA, Inc. has announced the Micro Level II General Ledger package written in Ryan-McFarland Corp.'s RM/Cobol.

Designed for use with Ryan-McFarland's RM/COS operating system, the MCBA package runs on a variety of microcomputer systems including Altos Computer Systems, Inc.'s ACS 68000 and NCR Corp.'s Tower I, according to a spokesman for the company. The Micro Level II General Ledger package is said to feature a user-defined general ledger account number structure and full multicompany capabilities.

The Micro Level II General Ledger package is also said to allow profit centers to be grouped into financial entities for sectional reporting, and the user can select the level of detail to retain and make adjustments to prior and future periods.

Inquiries reportedly can be made into general ledger accounts through the terminal screen. Further, the package formats user-defined financial statements using a built-in report generator, according to the spokesman.

Micro Level II General Ledger is priced at $900.

Additional information is available from MCBA, which can be contacted at 2441 Honolulu Ave., Montrose, Calif. 91020.

Portable fits IBM micros

ROCKVILLE, Md. — International Systems Marketing, Inc. has announced an IBM Personal Computer-compatible portable computer.

The Unisystem-PC reportedly is a 16-bit system featuring the Intel Corp. 8088 microprocessor, 256K bytes of internal memory, two 360K-byte floppy disk drives and a 9-in. monochrome monitor.

The company also announced a Unisystem-XT portable, designed to be compatible with the IBM Personal Computer XT. It reportedly features an internal 10M-byte Winchester disk drive and a 360K-byte floppy disk drive.

The company also announced that a color monitor will be available as an option.

The Unisystem-PC and XT are scheduled for delivery in the second quarter of 1984, while the color monitor will be available in the third quarter.

The Unisystem-PC base price is $2,795, and the XT price is $3995. The color monitor will cost an additional $500.

International Systems Marketing is located at Suite 6, 932 Hungerford Drive, Rockville, Md. 20850.

Lotus forms Boston group

CAMBRIDGE, Mass. — Lotus Development Corp., producer and marketer of microcomputer software, has announced the formation of a Boston-area Lotus User Group.

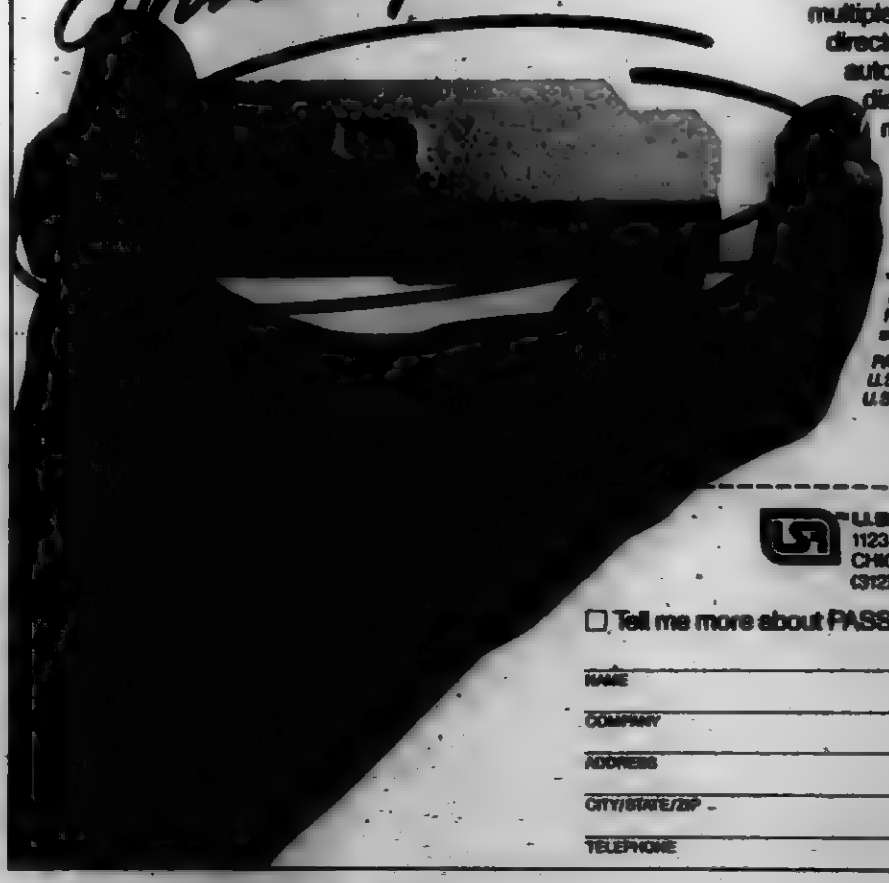
The first meeting of the group is scheduled to take place Tuesday, March 13, at 7 p.m. at Boston University's Sherman Union Building. Mitchell Kapor, president of Lotus, will be the guest speaker.

Lotus' 1-2-3 is a program that integrates spreadsheet analysis, graphics and information management.

Several independent users groups already exist throughout the U.S. All current and potential users of 1-2-3 are invited to attend the meeting.

Lotus can be reached at 161 First St., Cambridge, Mass. 02142.

Our Password™ modem's sophisticated new control panel



THE BUSIER YOU ARE, THE BETTER YOU LIKE IT.

PASSWORD™ is a modem so efficient and convenient there is little to do but turn it on to transmit at 300/1200 baud. Operating features include auto dial/answer, auto mode/speed select, full/half duplex. PASSWORD has all this, plus a two-year limited warranty, at a price of just $449.*

TELPAC™ telecommunications software (optional) programs PASSWORD to transfer files, in terminal or host mode, with multiple error checks. Phone directory gives choice of timed automatic or one-touch dial and logon. Command mode includes file display and update, menus and help, and much more. Write or call for complete specifications.

*Suggested list for PASSWORD complete with power, phone, RS232 interface cables. TELPAC software optional extra, $79.

Study ponders Microsoft, Digital Research

By Patricia Keefe
CW Staff

SAN JOSE, Calif. — Microsoft, Inc. is on its way to becoming the first billion-dollar software company, while its competitor, Digital Research, Inc., may be left with minimal market share unless it comes up with something innovative, according to a recent study released here by Strategic, Inc.

"Digital Research/Microsoft — The Key Issues" called IBM's decision to endorse Microsoft's MS-DOS — and thereby dethrone Digital Research as the "undisputed leader" of microcomputer operating systems — "one of the most important events in the last decade in microcomputers." This move not only "repositioned" Digital Research and Microsoft in the 16-bit market, but "cut off" Digital Research's greatest potential growth path, the report said.

It also chastised Digital Research for initially refusing to put its own languages under MS-DOS, while Microsoft was planning to support Digital Research's CP/M-86 with its own languages. Now the positions are reversed, Strategic claimed, with Digital Research making its languages available under MS-DOS and Microsoft stopping with a CP/M-86-compatible Basic.

The study also claimed that there are several kinds of applications software and other functions that should be standardized and built into future operating systems. These include graphics, data base, communications, multitasking and a much higher level of user interface. Praising Microsoft for taking an "ambitious" approach to address all these areas in integrated and compatible sets of MS-DOS and Xenix, the report accused Digital Research of addressing these areas "piecemeal" with separate extensions to the various versions of CP/M for graphics and networking and with multitasking and multiuser versions.

Strategic predicted there will be no contest between an integrated Microsoft Xenix-compatible version of MS-DOS with all the above functions and the "fragmented" CP/M-86 line, "especially if IBM licenses both MS-DOS and Xenix for the Personal Computer to sell under its own name, as is expected.

"Digital Research must regroup and plan a coordinated development strategy in order to have any hope of regaining market share in operating systems," Strategic asserted. The report added that while Digital Research can keep some share of the market by having products that are compatible with those of Microsoft's, it "will not have a very large share unless it can find some major enhancement that Microsoft has not considered. Reacting to Microsoft is not enough. A commitment to long-term, coordinated development is needed," the report concluded.

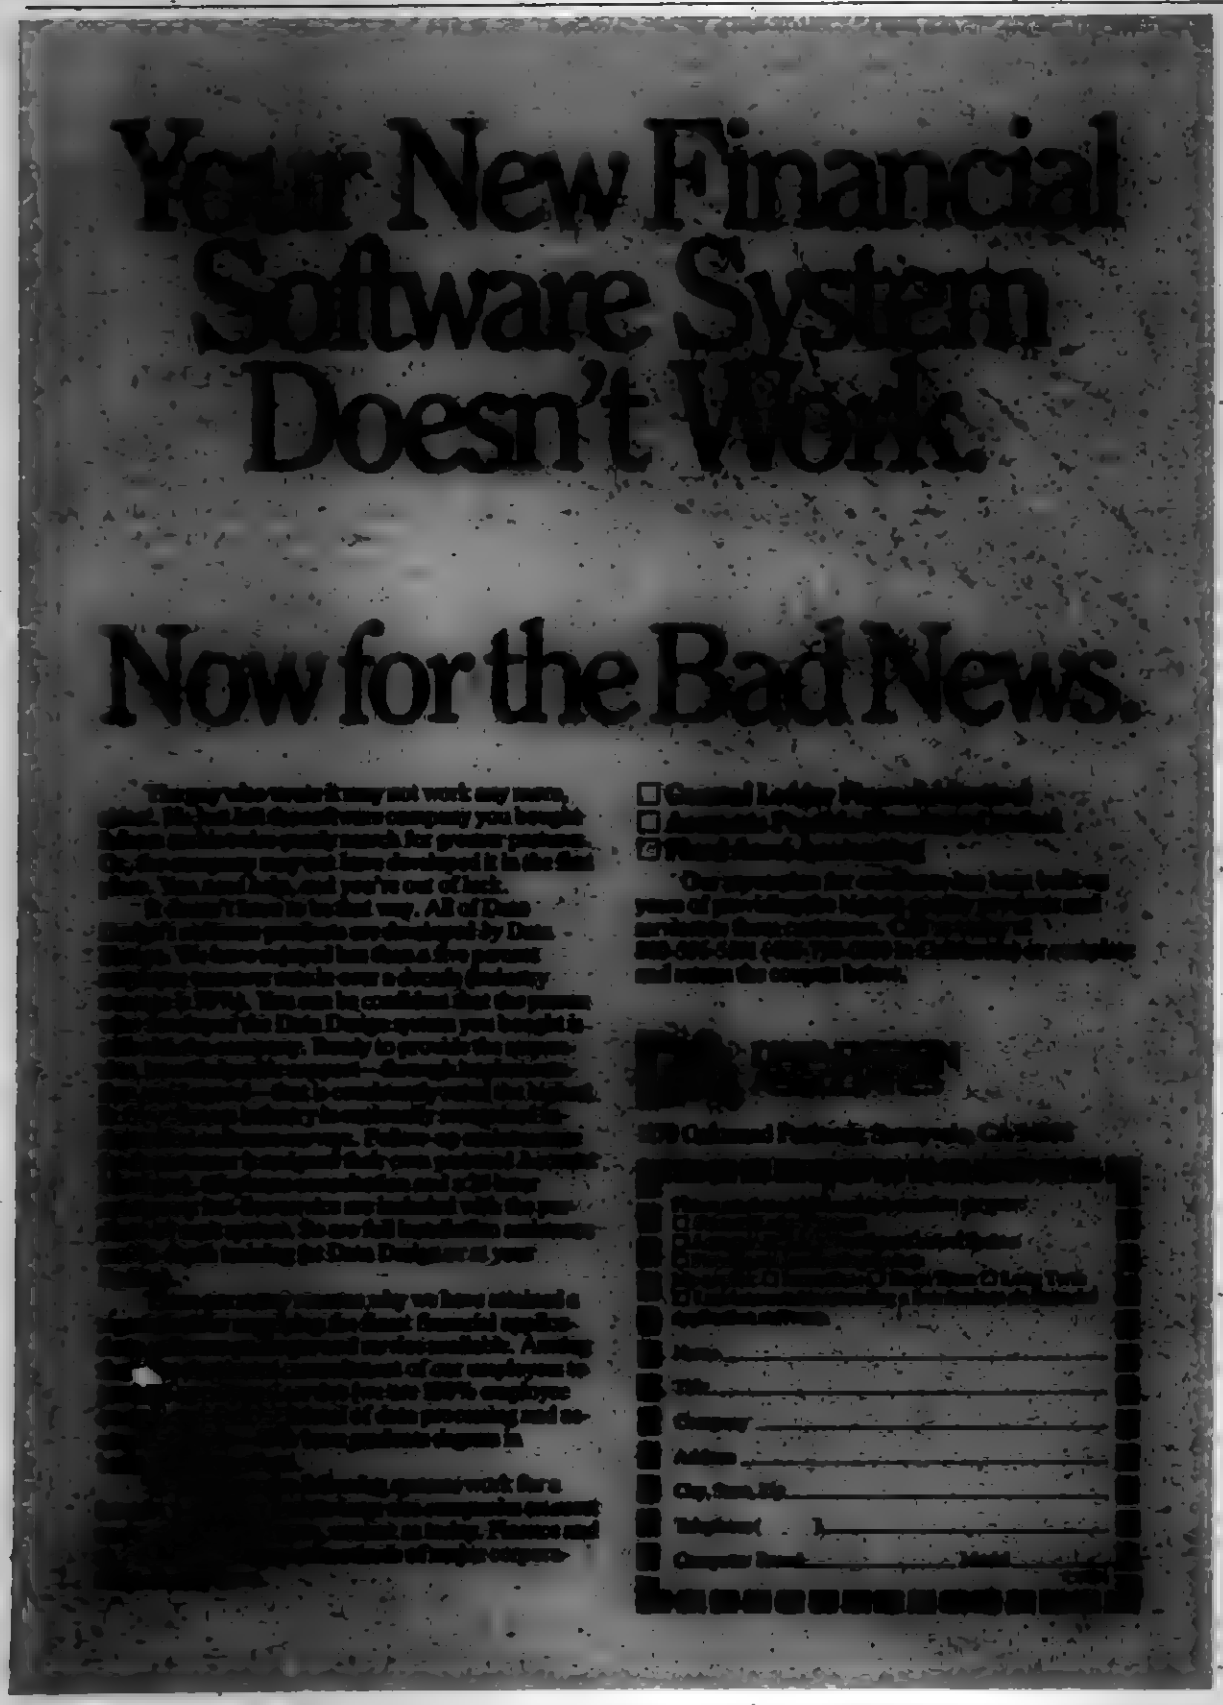
Digital Research also comes in for some scolding over customizing. The report claimed that Digital Research has left the customizing of CP/M almost entirely to the manufacturer or user and, as a result, has collected much less information on user needs and has less contact with industry than has Microsoft. "Consequently, Microsoft knows the product plans of most of the major manufacturers of home computers and 16-bit systems," the report said.

Another area where Strategic sees Microsoft outmaneuvering Digital Research is in the home computer market. However, the report pointed out that "the company that sells operating systems has an advantage in supplying programming languages and applications." Digital Research, it noted, is not about to lose its programming language market and still has opportunities in applications.

While Digital Research has gained some ground on Microsoft with its multitasking Concurrent CP/M-86, which IBM itself is selling, Strategic predicted it will lose ground to a multitasking version of MS-DOS unless it can find the path to greater levels of integration and function.

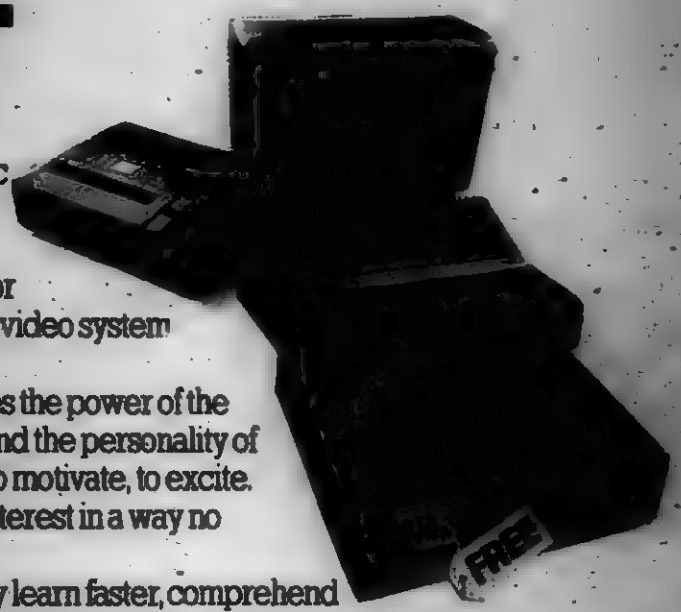
Microsoft, on the other hand, "is the only company that can set the [operating systems] standards to suit its own needs," according to the report. While developing new operating systems and applications, Microsoft can gain leverage from other software houses that are forced to support its systems software, the report added.

Overall, Strategic expects Microsoft will be expanding rapidly in the next few years. Although it originally did little besides languages, Strategic described Microsoft as "an important hardware maker, the leading operating systems house and a very significant applications developer."



A WORD TO ANYONE LOOKING FOR UNIX TRAINING:

FREE.



Introducing Vision. The first Unix Interactive Video Training Curriculum. And our last Free Introductory Offer.

Now you can own an IBM Personal Computer, laser videodisc player, color monitor and Interactive Training System Controller, absolutely Free.

Simply lease our new Unix Interactive Training Curriculum for one year. And get this complete interactive video system at no extra cost.

Interactive video training combines the power of the computer, the speed of a laser disc and the personality of classroom instruction. To involve, to motivate, to excite. To capture and hold a student's interest in a way no other medium can.

Students learn by doing, so they learn faster, comprehend more and retain information longer. They spend less time away from the job. And are more productive once they return.

Because training is targeted, students learn only what they need to know to do the job. Now.

What's more, Vision was developed by Interactive Training Systems, the leader in interactive video training, and Computer Technology Group, the leader in Unix training.

The result? Unix training so fast, so effective and so affordable, we back it with a full 30-Day Money-Back Guarantee.

Take advantage of our Free Introductory Offer. Send in the attached coupon. Or call us at 1-800-227-1127.

AFTER MARCH 31, 1984 OUR FREE INTRODUCTORY OFFER IS NO LONGER FREE!

☐ Please have a representative contact me immediately.

☐ Please send me more information about Vision, the Unix Interactive Video Training Curriculum.

Micro-to-mainframe:

Before you settle for solution, ask a few serious

Choosing a micro-to-mainframe communications system is no game.

If you make the wrong choice, the consequences can be very expensive.

So before you toy around with "easy" solutions, do yourself a favor and ask some serious questions.

You might want to start with these:

Will this product support full IBM Terminal Emulation?

Make sure the system you choose offers *full* protocol emulation. It should be able to emulate remote batch and interactive IBM terminals and terminal systems.

Does the company offer a variety of products to solve my problem?

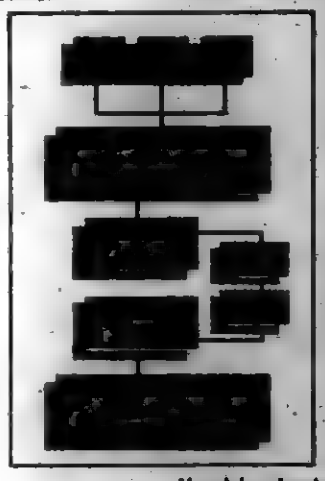
The manufacturer you select should be able to handle *any* operating environment. You should have your choice of stand-alone front-end processors, IBM PC or XT boards, or an OEM board. And make sure the products will run on the most popular operating systems, including CP/M, MS-DOS and UNIX.

Can I get fast answers to my questions?

Insist on toll-free access to qualified service personnel before and *after* the sale. A Product Support Group should be available during your normal business day.

What if I need a quick analysis of a problem?

If you run into a problem, you shouldn't have to sit through a lengthy question-and-answer session over the phone. Ask if the manufacturer has a Communications Test Center that allows for product testing over public phone lines. And find out if the product has internal diagnostics that point out problem areas right on the screen.



Suppose something goes wrong with the unit?

Be sure the company offers a service plan that includes a 30 day money-back guarantee and a 12 month warranty that includes a free replacement unit.

a simplistic questions.

What about future product development?

It's not enough for a company to solve your communications problems today. Ask about their commitment to R&D. Are they working on products you're going to need soon? If not, you might want to consider someone who is.

Who am I dealing with anyway?

In a market as volatile as this one, you need some reassurance that the people you buy from will be around to back up their products. Ask how long they've been in business. The longer, the better.

How much is all this going to cost?

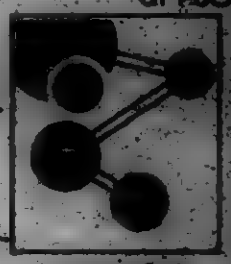
There are lots of micro-to-mainframe solutions with lots of price tags. But here's a point of reference for you:

Our own DataTalker™ product line will give you all the capabilities and services we've just described for as little as $695. Complete.

Granted, this isn't all the information you'll need to choose the right micro-to-mainframe solution. But it's a good start.

If you'd like to know more—and there certainly is more to tell—contact our Marketing Support Group at 1-800-321-7785.

We'll make sure you get the answers you need. And we won't play games.



Providing Data Communications Solutions

Winterhalter, Incorporated
3853 Research Park Drive,
P.O. Box 2180, Ann Arbor,
Michigan 48106. 313/662-2002.

MICROCOMPUTERS

STORAGE

UNISOURCE SOFTWARE CORP.
Hard disk with Venix/86

Unisource Software Corp. has announced a hard disk expansion unit, loaded with Venturcom, Inc.'s Venix/86 operating system.

The disk plugs into a floppy disk slot on IBM's Personal Computer and allows the user to run Venix/86, Venturcom's version of the Unix operating system, the vendor said. The system features a hard disk partition for Venix/86 and Microsoft, Inc.'s MS-DOS files and programs, four editors and a C compiler, the vendor said.

The unit costs $2,095.

Unisource Software, 71 Bent St., Cambridge, Mass. 02141.

AUXILIARY EQUIPMENT

THE EVALUATOR
The Order Processing and Billing Manual

The Evaluator has introduced the second in a series of business systems reference and software comparison manuals.

The Order Processing and Billing Manual, which follows the Accounts Receivable Manual, reportedly provides detailed microcomputer software package comparisons for each of the listed business questions.

The cost of each manual is $18.95, plus $3 shipping and handling. Annual trimester updates are available at a cost of $44.50 per manual.

The Evaluator, P.O. Box 4348, 1004 Hope St., Springdale, Conn. 06907.

CONDOR COMPUTER CORP.
Hands-on Condor

Condor Computer Corp. has introduced "Hands-on Condor," a self-teaching workbook made up of 12 lessons that help users learn about the Condor Management System.

According to the vendor, the workbook emphasizes business uses of the Condor, teaching each of the Condor commands with a sample application, including personnel, scheduling and transaction processing.

The workbook is priced at $24.95 and requires Condor software and a microcomputer. It will be available March 15.

Condor Computer, Suite 125, 4984 El Camino Real, Los Altos, Calif. 94022.

APPLE COMPUTER, INC.
Apple Modem 300, 1200

Apple Computer, Inc. has announced two modems, a 300 bit/sec unit and a 1,200 bit/sec model, for its Apple II, Apple III, Macintosh and Lisa personal computers.

Using the modem and standard telephone equipment, users can transmit and receive data files, electronic mail and programs to and from other personal computers, minicomputers and mainframes, Apple said. In addition, the Apple microcomputers can be used for home banking transactions or can tie into information services.

The modems are command-compatible with Hayes Microcomputer Products, Inc.'s Smartmodems and work with a variety of communications software packages, the company noted.

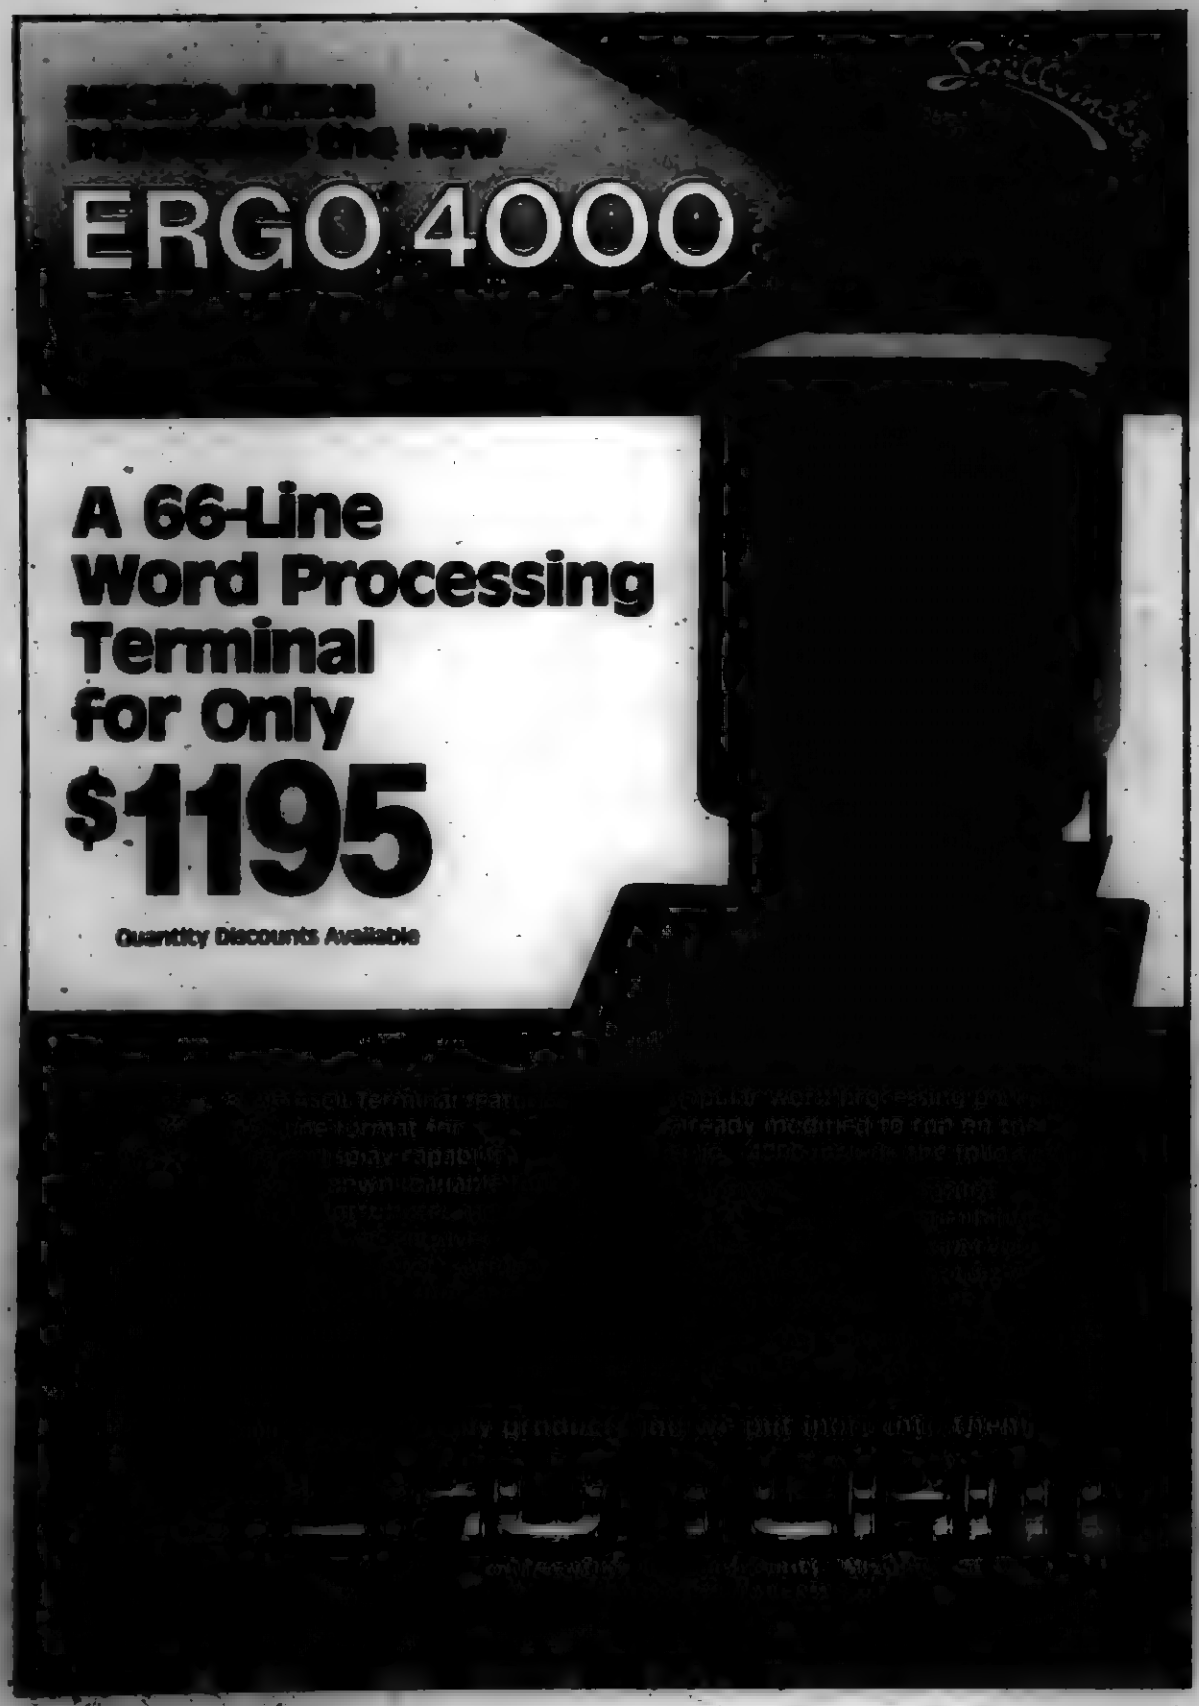
The Apple Modem 1200 operates at both 300 and 1,200 bit/sec, while the Apple Modem 300 operates at speeds of 300 and 110 bit/sec. Both modems provide built-in autodial and autoanswer functions.

The modems use an RS-232C serial interface with a 9-pin connector. A serial interface card is required to connect the modems to an Apple II. The modems plug directly into the built-in serial port of any Apple III, Apple III+, Macintosh or Lisa microcomputer.

Each modem comes with an accessory kit that contains an installation manual, a user's manual and the connector cables designed to support the user's particular systems. Apple II users may purchase an optional accessory kit that includes the serial interface card.

The Apple Modem 300 is priced at $225, or $299 with the optional accessory kit and card; the Apple Modem 1200 costs $495, or $570 with the kit and card.

Apple Computer, 20525 Mariani Ave., Cupertino, Calif. 95014.



SOFTWARE

SOFTWARE CONNECTIONS
LAN: Mail Monitor

Software Connections has introduced LAN: Mail Monitor, a package for local-area networks.

The software turns networked IBM Personal Computers, Apple Computer, Inc. Apple II and IIe micros and compatible systems into electronic mailboxes, the company said.

The product is a store-and-forward electronic mail system designed to be used as an internal message system and a file transfer system that can send data over phone lines.

Two versions are available: A standard package for up to 25 users costs $745; the large network version allows up to 10,000 users for $1,195.

Software Connections, 2041 Mission College Blvd., Santa Clara, Calif. 95054.

NBI, INC.
Tools fit Ossys

NBI, Inc. has announced that three popular microcomputer software

Continued on page 100

"The computer is down."

Every day another business goes "on line." Every day the world becomes more dependent on computers. And every day it becomes more important for the world to have a computer that won't go down, or even skip a heartbeat.

Over the past decade there have been computers designed to withstand hardware failures and eliminate downtime. However, all previous approaches depend heavily on software techniques to provide fault tolerance. A comparison of these old systems with the new Stratus/32 Continuous Processing™ System will illustrate how far we have come in one leap, by using advanced hardware technology instead of complex software.

How the Stratus Hardware Solution Supersedes the Software Solutions.

Stratus's hardware design means that fault tolerance is invisible to your application programs and users. You can even move previously developed applications to Stratus with NO CHANGES and NO PERFORMANCE LOSS for fault tolerance. In contrast, the software-based systems require complex, performance-stealing software in order to implement fault tolerance. This means that new programs are more difficult to develop, they run slower, and existing programs can't be run without major changes.

An added benefit of the Stratus fault tolerant design is that you can expand your system with additional processors as your computing needs grow. In fact, you can have up to 32 fault tolerant processors, 2000 communication lines, and 100 billion bytes of storage in a single Stratus system.

Hardware Self-checking Causes a Breakthrough in Service.

Each Stratus/32 tests itself EIGHT MILLION TIMES A SECOND while it executes your programs, so faults are detected BEFORE they corrupt your data. And when there is a failure, there's no need to rush to call your Stratus service technician. For one thing, the failed component, be it a CPU, controller, disk, or power supply, has a partner that continues operations as usual (without slowing down the system), so there's NO DOWNTIME. In addition, repairs can be made WITHOUT STOPPING THE SYSTEM. It is so easy to repair a Stratus/32 that our service is provided at about one-half the average price charged by other computer manufacturers.

$140,000, Software Included.

Our prices are competitive with "normal" systems (i.e. ones that do not provide fault tolerance), and substantially lower than the software-based fault tolerant systems. $140,000 buys you a complete four megabyte 32-bit system with 60 megabytes of disk storage, magnetic tape drive, and system SOFTWARE. If you like our hardware, you will be even more impressed with our software. (A common reaction among our users.) Briefly, our software offering includes VOS (a virtual operating system), transaction processing, networking, IBM communications, data management system, interactive forms builder, symbolic debugger, COBOL, Basic, PL/I, Fortran, Pascal, word processing....

To get more information call us at 617-653-1466.

The computer you can count on has arrived.

CONTINUOUS PROCESSING™

Now that the world relies on computers it needs a computer it can rely on.

MICROCOMPUTERS

Continued from page 98

packages — Microsoft, Inc.'s Multiplan and GW Basic and Ashton-Tate's Dbase II — are now available for NBI's Onyx 2000 workstations.

NBI's Multinet interface allows its Onyx 64 controller to connect Onyx 2000 workstations. The three programs can be shared in the network, according to the vendor.

For one to 16 users, Multiplan costs $750; for 16 to 32 users, it sells for $1,500. GW Basic comes with Microsoft's MS-DOS operating system, which costs $425 per copy. Dbase II costs $1,995.

NBI, P.O. Box 9001, Boulder, Colo. 80304.

CONSUMERS SOFTWARE, INC.
Spreadsheet Auditor

Consumers Software, Inc. has introduced Spreadsheet Auditor, which permits users to audit the formulas behind their Visicorp Visicalc, Lotus Development Corp. Lotus 1-2-3 or Sorcim Corp. Supercalc spreadsheets.

The auditor displays the formulas on a grid on the user's screen and wraps long formulas around for easier reading, according to the vendor. With the Spreadsheet Auditor, users of Lotus Development's 1-2-3 can get a complete listing of all named and other special ranges contained in their work sheet, the vendor said.

Versions of the Spreadsheet Auditor are available for Apple Computer, Inc.'s Apple II+ and Apple IIe computers with at least 48K bytes of memory and for IBM's Personal Computer, Personal Computer XT and Personal Computer compatibles with 128K bytes of memory.

The Spreadsheet Auditor licenses for $90.

Consumers Software, Inc., Suite 106C, 214 E. Holly St., Bellingham, Wash. 98225.

NOVELL, INC.
Netware/P Operating System

Novell, Inc. has announced the Netware/P Operating System for Proteon Associates, Inc.'s Pronet local network hardware system that connects as many as 64 IBM Personal Computers, Personal Computer XTs and other Personal Computer compatibles.

Netware/P is said to make available to networking microcomputers 150M bytes of disk storage attached to a central Netware file server, which can be any IBM Personal Computer-compatible microcomputer. Up to three printers can also be connected to the file server, a Novell spokesman said.

A file server design allows different computers' operating systems to coexist on the network, sharing the same mass storage devices under the Netware shell.

Netware/P currently supports IBM's PC-DOS 2.0 and Version 1.1 and Digital Research, Inc.'s CP/M 86.

Netware/P is priced at $1,495.

Novell, 1170 N. Industrial Park Drive, Orem, Utah 84057.

AUTOMATED PROFESSIONAL SYSTEMS, INC.
Apagraph

A business graphics program called Apagraph, running under Digital Research, Inc.'s CP/M 80 operating system and able to access data from spreadsheet programs, has been announced by Automated Professional Systems, Inc.

The software produces line graphs, pie charts, bar graphs, stick graphs, step graphs and scatter plots and can read multiple data files and produce a single graph with overlayed images for each set of data, according to the vendor.

Apagraph is for the executive or professional who needs to produce graphs quickly and wants to do so without learning a command language, said Amal Chaudhuri, Automated Professional's director of research and development.

Apagraph is priced at $295 and is available through Automated Professional's software dealer network.

Automated Professional Systems, 270 Madison Ave., New York, N.Y. 10016.

DATAMENSION CORP.
Report Manager enhancements

An advanced version of Datamension Corp.'s Report Manager spreadsheet for the IBM Personal Computer has

Changing our ribbon is a snap.

Most printers make you fool with a messy ribbon.

But with Digital's Letterprinter 100, all you have to do

is snap in one of our replacement cartridges.

You'll instantly get at least 5 million more characters' worth of ink.

Easy, isn't it?

The fact is, everything about the Letterprinter 100 is easy.

For example, with just a flick of a finger you can select

up to five different typefaces. Or let your

computer do it for you, automatically.

If you can't find a typeface you like,

we'll customize one for you.

Now why would the world's second

largest computer company go to

such lengths to make the

Letterprinter 100 so

accommodating?

Simply so it can spend more

time doing what you bought it

to do in the first place.

And that's printing crisp

manuscripts and graphics

quickly. Some of our customers

in high speed printing applications

even in only 15 months.

The Letterprinter 100.

Digital is proud to announce

for the small printer

environment.

For the

Printer.

digital

MICROCOMPUTERS

Continued from page 100

been released, incorporating 60 enhancements, including a cut-and-paste feature and key word search, the vendor said.

Using the cut-and-paste feature, managers can download column data from any program, whether on a micro, mini, mainframe or time-sharing system, the vendor said, so long as the proper communications for the data transfer are established.

The software's new nested-sort feature, meanwhile, allows columns, rows or pages to be sorted individually or collectively on as many as three sort fields, the vendor noted.

The enhanced Report Manager also includes 11 new preprogrammed functions, bringing its total to 68. Among them are time-and-date stamping and billable hours calculator, the vendor said.

The advanced version of Report Manager, including a training diskette, tutorial manual and on-line Help function, is available for $495.

Datamension, 615 Academy Drive, Northbrook, Ill. 60062.

PERSONAL COMPUTER PRODUCTS
Package of file transfer programs

Personal Computer Products has released a package of file transfer programs, featuring new conversion utilities, that will allow users of Digital Research, Inc.'s CP/M-based computers, the Apple Computer, Inc. Apple II and III models or Radio Shack personal computers to route files to IBM Personal Computers and IBM Personal Computer compatibles.

According to the vendor, the package features key word fix-up, which aids the spacing of Basic programs.

The file transfer programs, the vendor said, will transfer any file, whether it is in Ascii, embedded control codes, compressed binary formats, encrypted data bases, high-level language, Visicorp's Visicalc electronic spreadsheet, word processor files or Apple's random files.

The complete package is available for $129.95.

Personal Computer Products, Suite C-18, Santa Clara, Calif. 95050.

DWJ ASSOCIATES, INC.
Pecom

IBM Personal Computer users can emulate a Hewlett-Packard Co. HP 2622A terminal and transfer files to and from their Personal Computer using a new program called Pecom from DWJ Associates, Inc.

Users will also be able to emulate HP 2623 and HP 2624B terminals, but without the graphics mode and alternative character set, the vendor said.

According to the vendor, Pecom is compatible with DOS 1.0, 1.1, 2.0 and 2.1 and has a 13 menu-function key hierarchy for selecting operating modes and performing other terminal and printer controls.

The program comes on one 5¼-in. IBM-format floppy disk and is available for $450. A $20 manual may be ordered separately.

DWJ Associates, One Robinson Lane, Ridgewood, N.J. 07450.

DELTAK, INC.
Teach Yourself Visitrend/Plot on the IBM PC

Deltak, Inc. has announced an instructional software program for IBM Personal Computer users who want to learn the vendor's Visitrend/Plot program.

Teach Yourself Visitrend/Plot on the IBM PC is said to provide users with the skills to manipulate Visitrend/Plot subprograms and menus to access various program features.

Three education diskettes provide on-line instruction, and the program handbook provides tutorial assistance and practice exercises.

Minimum program requirements are an IBM Personal Computer with 128K bytes of random-access memory, the IBM PC-DOS Release 1.0, 1.1 or 2.0 operating system, one single-sided diskette drive and an IBM video terminal that can be used with a color/graphics adapter.

The program is available now for purchase for $70. Rental rates also are available.

Deltak, East-West Technological Center, 1751 W. Diehl Road, Naperville, Ill. 60566.

THE BUSINESS LIBRARY CORP.
Business Library Information Retrieval Volume

The Business Library Corp. has added an information retrieval and report generator module to its Business Library software for the IBM Personal Computer and compatible systems.

Designated the Business Library Information Retrieval Volume, the software is said to permit data recovered from password-protected files to be used as generated or to be merged into other data files. Using a universal data base management program, it can be turned into various formatted reports or, using standard communications software, be passed to a mainframe processor for further analysis.

While the software integrates with other Business Library volumes as required, it also contains a second level of security so that confidential data such as payroll information remains protected, the company said.

Users are able to tap as many as three different data bases simultaneously, accessing as many as 40 different data fields in each, to produce a new record with a maximum of 251 characters.

The Business Library Information Retrieval Volume costs $395.

The Business Library, P.O. Box 844, Pasadena, Calif. 91102.

See TOOLS page 104

From

, to

Nobody puts ideas on paper so many ways.

If you're using your printer with a personal computer, you probably need one that can handle a variety of functions.

At the same time, the price should be in line with the computer itself. Low.

The pint-sized Dataproducts printer in the picture costs about as much as one good software package.

It prints spreadsheets, graphics and illustrations, labels, multi-part forms—even letters that look like they were typed.

But let's say you're running a big computer and it's hundred-page reports you need. Pronto. Or documents by the millions.

The printer on the right finishes a full computer printout page in less time than it takes to sneeze. At 2,000 lines a minute, it prints much faster than you can see. Three shifts a day. Year after year.

In between these two special-duty Dataproducts printers are whole families of other Dataproducts printers—daisywheel printers, non-impact printers, high-security printers for the government, and more.

In fact, we make more different kinds of computer printers than any other independent printer company in the world.

Very likely we make one that fits your needs exactly.

Write us at 6200 Canoga Avenue, Woodland Hills, CA 91365. Or phone (818) 887-3924. In Europe, 136-138 High Street, Egham, Surrey, TW 20 9HL England.

Dataproducts computer printers.

TOOLS from page 102

SELECT INFORMATION SYSTEMS
Select Bilingual

Select Information Systems has released a Spanish/English word processing package that includes both Spanish and English menus, Help screens and commands.

The package reportedly contains a bilingual version on-screen interactive tutorial, a Spanish/English spelling checker and a mailing list merge/print function.

Select Bilingual requires an IBM Personal Computer, Personal Computer XT or compatible system operating under IBM's PC-DOS Release 2.0 or 1.1, 128K bytes of random-access memory and two double-sided disk drives or a hard disk drive. It is priced at $395.

Select Information Systems, 919 Sir Francis Drake Blvd., Kentfield, Calif. 94904.

SOFTWARE ARTS, INC.
Visicalc Advanced Version

Software Arts, Inc. announced Visicalc Advanced Version, an enhanced version of Visicalc for the IBM Personal Computer.

"This advanced spreadsheet has a number of new capabilities including variable column width, keystroke memory, an extensive help facility and support of the Microsoft, Inc. mouse," said Dan Bricklin, chairman at Software Arts.

Visicorp in San Jose, Calif. was exclusively marketing Visicalc until Software Arts filed suit last month to terminate a marketing agreement the two companies signed in 1979. Visicorp continues to sell Visicalc. Visicalc Advanced Version costs $99.

Software Arts, 27 Mica Lane, Wellesley, Mass. 02181.

MARKET from page 89

move back and forth from one application to another.

Though most integrated software products are aimed at business markets, even the inexpensive home and personal computers will incorporate these features at a fraction of the 1983 price of such innovative systems as the Apple Lisa or the IBM Personal Computer XT.

According to CSI, as competition for hardware sales intensifies, manufacturers will find themselves forced to offer free software or lose important market share.

Market leaders will continue to spend more and more money on establishing name identity and brand image, and, eventually, brand-name identification will be a key barrier to entry.

Key competition in this market ultimately will center on the operating environment, offering a more sophisticated combination of single-user, multifunction features.

Telecommunications compatibility will be a major competitive battleground in upcoming years.

The report also speculates that Japanese computer companies will make significant advances into the U.S. personal computer market, and that there will be substantial room for innovation in the new-generation microcomputer software market.

The report costs $1,450 and is available from Creative Strategies International, Suite 275, 4340 Stevens Creek Blvd., San Jose, Calif. 95129.

DISK from page 89

a unique disk format without providing any formatting capability forced users to buy diskettes from DEC. Better judgment finally prevailed, and DEC recently announced the availability of a formatting program that will allow consumers to use other than DEC diskettes. We can hope that IBM will let Microsoft make PC-DOS compatible with MS-DOS rather than following DEC's bad example.

Vanilla versions

If applications software manufacturers will attempt to use "vanilla" versions of DOS and avoid nonstandard features, the efforts toward compatibility will be strengthened. Also, if consumers of microcomputer products will make known the desire for compatibility, the process will be encouraged.

Finally, hardware manufacturers would do the public a service by refraining from using proprietary operating systems. In the long run, the use of a nonstandard DOS will not benefit anyone: not the consumer, not the applications software houses and not the original hardware manufacturers.

Madron is manager of computer services at North Texas State University, Denton, Texas 76201.

PURCHASE from page 89

available, and prospective users are encouraged to learn about a package by running it.

"The store ensures that Manufacturers Hanover Trust does not wind up with an expensive inventory of unused, unsupported, misunderstood systems."

Since the store opened, the type of employee evaluating a personal computer has changed dramatically, Smith said.

"While technically oriented managers and professionals were the first to show interest in personal computers, the balance is beginning to shift to business-oriented managers," Smith said.

You can advertise your product in 40 computer publications in 25 foreign countries—with one phone call.

There's a market for your product abroad.
You can reach the right people in the major computer markets throughout the world. The people who make the buying decisions—in countries already importing more than $3 billion in computer hardware, software and supplies.

CW International Marketing Services gives you one, efficient source for direct contact with the leading local computer publications in the world's major computer markets. How can we do this for you? We have a wide network of editorial offices around the world and provide first hand marketing information to our clients. Plus, we have over 10 years experience in the publishing industry.

We're a division of CW Communications/Inc., publishers of *Computerworld* and the world's largest publisher of computer-related newspapers and magazines.

CW International Marketing Services makes it easy.
We'll translate your ads for you and give you production services to meet the specifications of any or all the newspapers and magazines we publish or represent—and—we'll even bill you in dollars. What's more, when you place your advertising through CWIMS, you save the V.A.T. (value-added tax). It's as easy as advertising in your local publications.

We'll even help you with market facts, and, in the case of the People's Republic of China, we can arrange for you to give product and marketing seminars there! You can run your ads in our periodicals in these countries:

*Argentina	*Denmark	*Italy	*Norway	*Saudi Arabia	*Sweden
*Australia	Finland	*Japan	*People's	South Africa	*The Netherlands
*Brazil	*France	Korea	Republic of	*Southeast Asia	*United Kingdom
Chile	Greece	*Mexico	China	*Spain	*West Germany

Now you don't have to be rich to be powerful.

Riches and power don't always go together. Take Plexus, for instance. The world's most powerful UNIX*-based supermicros.

Powerful because multiple processors share the UNIX load. So processing power is distributed to where it does the most good.

Terminal I/O. Disk I/O. Data communications. And, of course, data processing.

Our unique architecture also lets us bring you the world's first UNIX Network Operating System (NOS). So you can combine Plexus systems in an Ethernet network for even more power.

NOS gives you real time, continuous access to files. From anywhere in the network.

Files are also updated on the same basis. So everyone in the network works with up-to-the-minute data. Automatically.

No waiting for file transfers. And that's a decided improvement over everything else that's out there.

You also get to save money on powerful UNIX-based software, including COBOL, FORTRAN, Pascal, BASIC, and C. Database management and word processing, too. As well as hundreds of third party UNIX packages.

Plus our own software and maintenance support. And even a software referral service for your OEM programs.

Does all this make us expensive?

Absolutely not.

In fact, Plexus systems cost thousands of dollars less than the minicomputers we outperform.

To get a better idea of just how good that performance is, come get a demonstration. Call *800-528-6050*, ext. *1444*. In Arizona, *800-352-0458*, ext. *1444*. Or write Ralph Mele at Plexus Computers, Inc., 2230 Martin Avenue, Santa Clara, CA 95050.

You see? You don't have to be rich to be powerful. Just smart.

Big promises belittle Trilogy

Trilogy Ltd. may have a problem similar to that being experienced by would-be Democratic presidential candidate Walter Mondale — setting its sights just a little too high, it risks severely damaging its credibility as expectations must be modified to accommodate reality.

Trilogy has again announced a delay in the scheduled shipment date of its better-than-IBM-compatible computer that will utilize wafer-scale semiconductors purported to allow dense packing of integrated circuits.

But this time Trilogy announced it has decided to "simplify" the design process in order "to reduce the level of technical risk associated with the development project."

That revision means the originally planned single processor machine would be too slow, so the company has decided to produce a dual-processor model and later on — it says a year later — put out a four-way processor.

Putting its best face on, Trilogy said the redesign will make the wafer-scale technology more "suitable" for applications other than the Trilogy machine. Undoubtedly, Sperry Corp. and Digital Equipment Corp. must be pleased to hear that the technology they've invested a combined $68 million in will be easier to plug into their own development plans.

But Sperry and DEC must surely now be having second thoughts about Trilogy's ability to carry through with its plans in a timely manner.

Delays are always to be expected with development of new technology. That's one good reason why vendors desiring credibility should not raise expectations too high, too soon.

Delays, therefore, are one thing to be

See TRILOGY page 118

Micro mart strong in business

But home personal computer mart still an enigma

By James Connolly
CW Staff

BOSTON — The market for personal computers in 1984 will continue strong in the business area, a "vacuum cleaner" for computers, but the home market is still unidentified, according to a director of user research for International Data Corp. (IDC) of Framingham, Mass.

Speaking at IDC's 19th Annual Information Processing Industry Briefing Session in Boston, Tom Willmott said, "I call business a vacuum cleaner because it is literally sucking up everything that we have, at least in experimentation with things."

Willmott also said he saw no immediate end to the "debacle" of the "price-sensitive" home computer industry.

"The home market clearly is still an unidentified application. That is not to say there won't be a crossover work load at home for business applications. Portables will be coming at us like a wave this year — business machines that can be brought home for business, word processing applications and spreadsheet applications. But that is not updating a checkbook, and you still can't get cash out of a telephone, so far as I can see. That says something about home banking. The struggle is in the fact that we have a device that costs $600 or more and really doesn't do much for us," he said.

He noted that the long-term home computer market is not the "keyboard and TV" market, but a market for the complete systems bought by professionals.

Willmott said he sees "excitement" in the use of computers in education, particularly with companies providing computers to public schools. He also reported that the use of personal computers is growing in engineering, particularly with computer-aided design and manufacturing at the personal-computer-based workstation. But he said there is "limited" use for the micro in scientific applications because most personal computers don't use the specialized programs that would be needed.

Willmott based his predictions on a recent IDC survey of personal computer users.

He said that other IDC research showed

Few takers for embedded protection

By Edward Warner
CW Staff

PETERBOROUGH, N.H. — Piracy is estimated to cost software developers millions of dollars in lost revenues, and efforts are under way to develop hardware-embedded protection for commercial programs. But there appears to be no great demand for the products as yet.

Software Protection Devices, Inc. is attempting to incorporate its Copyrighter software protection system into a microcomputer chip under joint development with The Western Design Center.

Romlock, Inc., meanwhile, has linked up with K-Byte, Inc., an OEM of video-game cartridges, to incorporate its software protection circuitry into K-Byte's cartridge circuitry. Romlock President W. V. Moore said his firm is researching applications for use in protecting software stored on diskettes.

The Copyrighter system is, however, in-

Kaypro, Mitsui join forces to market portable

By Patricia Keefe
CW Staff

NEW YORK — Kaypro Corp. has linked up with a major Japanese company and will reportedly begin marketing this summer a notebook-size computer that uses programs designed for the IBM Personal Computer.

The computer is manufactured by Mitsui Co., a $70 billion Japanese trading group. Kaypro announced at its annual meeting last month that it has become the "first-choice U.S. distribution channel" for the Japanese firm, in a move that gives both Kaypro and Mitsui a "foot in each market."

Kaypro plans to sell the machine as a high-end addition to its current product line, but declined to offer specifics on price and performance. When connected to its base station, the tiny computer reportedly runs programs such as Lotus Development Corp.'s Lotus 1-2-3. IBM compatibility suffers when the portable is freed from the base because of video screen differences, according to reports. Its permanent memory is said to hold programs for word processing and spreadsheets.

The distribution agreement between Mitsui and Kaypro underlines the latter's belief that success in the personal computer market is based primarily on marketing rather than engineering technology or manufacturing, according to a spokesman.

Listing market position and distribution channels as its strategic assets, Kaypro sought to capitalize on those strengths by teaming up with a partner offering "formidable engineering and manufacturing capabilities, but with limited distribution channels," according to Blair Newman, Kaypro's director of marketing and strategic planning.

As a result of the agreement, "Kaypro gets tremendously expanded production, manufacturing and engineering capabilities without spending millions to bring it in-house," explained Michael Dortch, a consultant to Kaypro. Mitsui receives the benefits of U.S. marketing and distribution channels, something Japanese players in the micro industry have always lacked, according to Dortch.

More specifically, Kaypro will handle the bulk of the research and development work, while Mitsui will either provide the manufacturing or serve as purchasing and negotiation agent for Kaypro, Dortch said. Implementation of the agreement will also allow Kaypro to label Japanese products, as well as provide access to robot assembly and advanced components.

Newman summed up Kaypro's new strategy saying future products may be labeled: "Designed in the U.S. by top independent technical talents, made in Japan by robots and sold worldwide by Kaypro."

Kaypro also announced recently it has signed a $25.2 million contract with Seagate Technology, Inc. for an undisclosed number of Seagate's ST212 half-height, 5¼-in. Winchester disk drives over an 18-month period. The 12M-byte drives will be incorporated into the Kaypro 10 portable computer.

"Have you got a card for someone who's been replaced by a computer?"

SCIENCE/SCOPE

Some of the fastest digital integrated circuits yet built have been demonstrated by Hughes Aircraft Company scientists. The circuits, made of gallium arsenide, are bi-phase clock flip-flops configured to perform frequency division. They were operated at frequencies up to 5.77 GHz, the highest division speed yet reported for integrated circuits operating at room temperature. The circuits were fabricated by electron-beam lithography (using a Hughes system) to produce gate lengths of 0.5 micrometers in the MESFET switching transistors. These gallium arsenide devices could be used in very-high-frequency signal processing or as interfaces to more complex chips, including Very High Speed Integrated Circuits.

A novel engineering tool for producing the AMRAAM missile is expected to save the U.S. government and Hughes millions of dollars and months of work. A full-scale prototype of the Advanced Medium-Range Air-to-Air Missile has been completed using actual engineering drawings, materials, and processes. The purpose of this "precision physical model" is to refine AMRAAM's design and detect potential manufacturing problems, especially those stemming from late improvements. Among other things, the model has been used to determine routes and lengths for wire harnesses so that mating connectors will line up. It also was used in designing handling and test fixtures, and to show how its components react to vibration. AMRAAM is in full-scale development for the U.S. Air Force and Navy.

Six gallium arsenide field-effect transistors, designed for power amplifiers in radar and communications applications, have been introduced by Hughes. The single- and dual-cell power transistor chips are mounted on internally matched chip carriers. The devices consist of 10-GHz, 13-GHz, and 15-GHz power FETs capable of output power levels up to 1.5 watts. They are matched to operate in a 50-ohm-in/50-ohm-out system for a full 2-GHz bandwidth.

Military commanders can get a detailed picture of tactical situations and the current status of their resources with a new display terminal. The Hughes HDD-8000 has two display screens, with one producing seven-color graphics with about twice the resolution of commercial TV. An innovative touch panel controlled by computer software lets an operator retrieve and display data very quickly. Commands that combine several complicated processes can be made with the touch of a fingertip. The system is built in modular form and is so flexible that it can be reconfigured to meet changing needs immediately. In an air defense command and control system, for example, it normally would display tactical air battle data and tactical air force resource data. As a battle grew and more information was needed, additional screens could be used.

The Hughes Tucson facility, located in picturesque Southern Arizona, is a large, modern manufacturing complex with capabilities for producing advanced missile systems developed by Hughes. We have openings for experienced and graduating engineers to work on such advanced systems as the electro-optical Maverick, radar-guided Phoenix, TOW, and AMRAAM, the Advanced Medium-Range Air-to-Air Missile. Please send your resume to Professional Employment, Dept. S3, Hughes Aircraft Company, P.O. Box 11337, Tucson, AZ 85734. Equal opportunity employer.

GSA store revamps federal micro procuring

By Andrew Blair
Special to CW3

WASHINGTON, D.C. — The General Services Administration's (GSA) computer store is radically altering the federal government's procurement of microcomputers. Instead of buying micros from GSA schedule contractors or local stores, government users are flocking to the GSA store in overwhelming numbers.

The impact of the GSA store will likely increase if GSA extends the concept to its 10 regional headquarters and expands product offerings to include telecommunication equipment.

The GSA store, called Office Technology Plus, is operated under contract with The Math Box, a local retailer that teamed up with five other firms to provide a range of consulting, sales and service. First opened for business only six months ago, the store has already surpassed GSA's original estimate of $2.5 million annual sales and is now grossing over $1 million per month.

The GSA store sells a variety of popular micros, peripherals, software and supplies and also offers training and maintenance. While the store offers processors from 15 manufacturers, only some of these makes are on hand in the store for demonstration.

The store is considered a success by GSA, according to William Fraser, special assistant to the GSA administrator. "Office Technology Plus is a full-service store that can provide configuration analysis, product information, side-by-side demonstrations, sales and follow-up training and service," he said recently. "We wanted more than hardware sales. The store serves an educational function and also permits government users the same access to microcomputers as their counterparts in the private sector."

Prime contractor The Math Box agreed. "The government has the same needs as a Fortune 500 firm," said Avner Parnes, president of The Math Box. "We offer the most popular models that reflect the commercial marketplace. In deciding to accept equipment for sale in the store, we look for its volume of commercial sales, compatibility with existing makes and available supply."

So far, approximately 45% of the processors sold have been IBM Personal Computers, 45% have been Compaq Computer Corp.'s Compaq Portable — which is IBM-compatible — and the remainder scattered among other vendors. Because of delays in delivering the Personal Computers, the store agreed to halt Personal Computer sales until back orders are filled and there is sufficient inventory to satisfy new orders.

User response has been enthusiastic. Tom Lewis, director of the Automated Systems Division for the Executive Office of the President, called the store "a good resource." According to Lewis, who has used the store several times, "The need for expertise is great. We need advice and counsel, sales and training." Lewis said the White House has also bought micros off GSA schedules. However, Lewis said he found the sales calls of hardware representatives often disruptive and a waste of time, and he prefers using the store at his convenience. According to GSA, the only problems with the store — mainly late and partial deliveries — stem from the unexpectedly large response the store has received.

The GSA store is already affecting established procurement channels. For low-dollar micro purchases, federal users previously bought micros from local stores under small-purchase procedures or from GSA schedule

Micro mart shake-up seen calling for top managers

By James Connolly
CW Staff

BOSTON — The shake-up of the personal computer industry does not mean less vendors, but it does call for more responsible and better managed firms, according to International Data Corp. (IDC), a market research firm based in Framingham, Mass.

Where there were 70 personal computer companies in 1981, 180 are competing in 1984; but those 180 must be innovative, well financed and responsive to user demands, IDC Research Manager Aaron Goldberg said at the IDC Information Processing Industry Briefing Session held here.

"[The year] 1983 was the end of the gravy train," Goldberg said as he outlined causes for computer company bankruptcies to an audience of industry representatives.

However, he emphasized that a shake-up, — not the assumed shakeout — is in progress. He said that changes were inherent in a shake-up, but that a shakeout would indicate market maturity or stagnancy.

Goldberg said the market cannot support 65 IBM-compatible machines and 12 integrated systems for those machines. Some of those companies are likely to die in the competition, he conceded.

Research manager of IDC's Santa Clara, Calif., branch, Goldberg noted that other manufacturers have been scared of IBM and afraid to take initiatives. He said that while there is "a whole bunch" of investment capital available, the competition will still be tough on the small, independent companies.

Instead, he said that established manufacturers such as Wang Laboratories, Inc., Honeywell Information Systems, Inc. and Burroughs Corp. can succeed in the microcomputer market because they have the $40 million to $100 million needed to develop and sell new products.

Goldberg said price stability is important in the personal computer market, particularly for resellers to maintain profit margins.

But he warned that new products and low prices don't guarantee success. "The biggest thing is that consumers are taking over. It's no longer just the 8% to 12% who understand computers. The people don't care about technological advances. They care about doing the job," he charged.

Goldberg said personal computer buyers want instant gratification when they plug in their systems, rather than intimidating 700-page instruction manuals. As an example, he cited word processing packages that allow users "to do something instantly better than they did it before."

A key to that instant gratification is the turnkey approach to hardware and bundled software, an approach used successfully by Kaypro Corp., he said.

He said computer buyers will look at personal computers as part of corporate information systems, not stand-alone buses, and that they will maintain brand loyalty for years to come.

Goldberg also told the industry representatives that virtual memory will be available for personal computers in 1985, and that there will be more multitasking and nonkeyboard tools such as mice and trak balls.

IDC from page 109

that 40% of Fortune 1,000 companies and a like number of government agencies have finalized multiple purchase contracts and that 70% of these organizations have at least completed corporate statements of direction as to personal computer standards and guidelines.

Noting the trend toward multiple buying, Willmott said, "Clearly, cost reduction was the reason for that kind of multiple unit acquisition. It isn't very glamorous, but we can get more hardware in the door for less money."

Willmott reported that the success of micro-to-mainframe links depends less upon technological breakthroughs than on information management. He cited as an example the fact that companies may discover that there is no need for the micro user to have a payroll program, but that the user may just need access to payroll information from the mainframe.

He said IDC surveys of buying patterns indicate direct vendor-to-user sales will "go through the roof," and that regional computer stores have taken a surprisingly large share, 32%, of the micro market.

But he also warned that for anyone to be successful in the small to medium-size business market, he must offer more than a box of equipment "with a good luck sign on it." He said added value is crucial and that it may be in the form of service or support.

Sigma Data files Paradyne suit

BALTIMORE — Sigma Data Computing Corp., a subsidiary of M/A-Com, Inc., filed suit in federal court here last week seeking damages from Paradyne Corp. in connection with Paradyne's alleged misconduct in winning an $84 million Social Security Administration contract.

That contract, which prompted a Securities and Exchange Commission suit charging Paradyne with defrauding the government, was awarded in March 1981.

Sigma reportedly claimed in court that it had the second lowest bid on the contract in question and would have won the award if Paradyne had not acted improperly.

The company seeks $20 million in compensatory damages, which it seeks tripled, and $10 million in punitive damages.

Stress financial managing, high-tech executives told

By Patricia Keefe
CW Staff

BURLINGTON, Mass. — Analyzing the marketplace is a prerequisite to financial planning for high-technology firms, an executive of an accounting firm involved with high-tech accounts told a group of chief financial officers recently.

Robert P. Schechter, partner-in-charge of Coopers & Lybrand's high-tech practice, told the executives that winners will take advantage of the opportunities afforded by technology while steering clear of risks unique to rapid innovation. Noting three elements said to be key to a company's success — technology, business strategy and marketing skills — Schechter said he would add a fourth element, financial management.

Speaking at a recent luncheon sponsored by the American Electronics Association for chief financial officers of high-tech firms, Schechter said financial management is important because it builds a company's internal financial measurement systems, determines how costs are allocated within an organization, creates the transfer pricing schemes for moving goods and services within the organization and generally implements the business manager's motivation systems.

This is particularly important due to the attributes that differentiate high technology from other industries as well as create unique types of risks. Those attributes include the volatility of technology, shortened product life cycles, rapidly dropping prices and an increasing number of suppliers competing within the same marketplace, he said.

Most financial managers fail because they lose control, he said, adding it is difficult to remain in control in an environment of fast growth. "You need to focus on projecting cash flow, making sure the financial plan is integrated with the business plan and tracking order rates."

Schechter outlined what he called factors for success for financial management in the "Pac-Man Age."

He advised planning according to product life cycles. Because computer products and services typically have a short life span, Schechter urged financial officers to make decisions on investment, leasing programs and payback periods in the context of short and very uncertain product life cycles. He also noted that successful companies have planned the process of ending a product's life prior to its introduction.

Prudent risk taking should be encouraged, he said. Measurement systems influence the way people behave, and managers have to be careful about what it is they measure, Schechter said. Too much control results in risk avoidance, but too little control exposes the firm to abuses and unwarranted risk, he added.

Authority and accountability must go hand in hand, a relationship that is a special problem among young and rapidly growing businesses, Schechter said. "Make sure the people with the payroll and ledger responsibilities also have balance sheet responsibilities," he said, adding "You need a clear set of rules for the game so that people can act responsibly and be accountable for their actions."

Timely, relevant and accurate information gives business an edge, Schechter said. Bills of material, cash collections and status of customer orders are extremely time-critical, according to Schechter. If information is late or inaccurate, he added, it impedes the management process and causes dissidence within an organization.

Schechter said many "of the problems that surface publicly in the computer business generally have their roots in the marketing organization running far ahead of the financial organization," and he urged "a fair amount of movement in lockstep."

GE announces plans for entering personal computer repair market

SCHENECTADY, N.Y. — General Electric Co.'s Instrumentation and Computer Service Department (ICSD) has entered the personal computer repair service, expecting the market for such maintenance to reach $1 billion within the next two years.

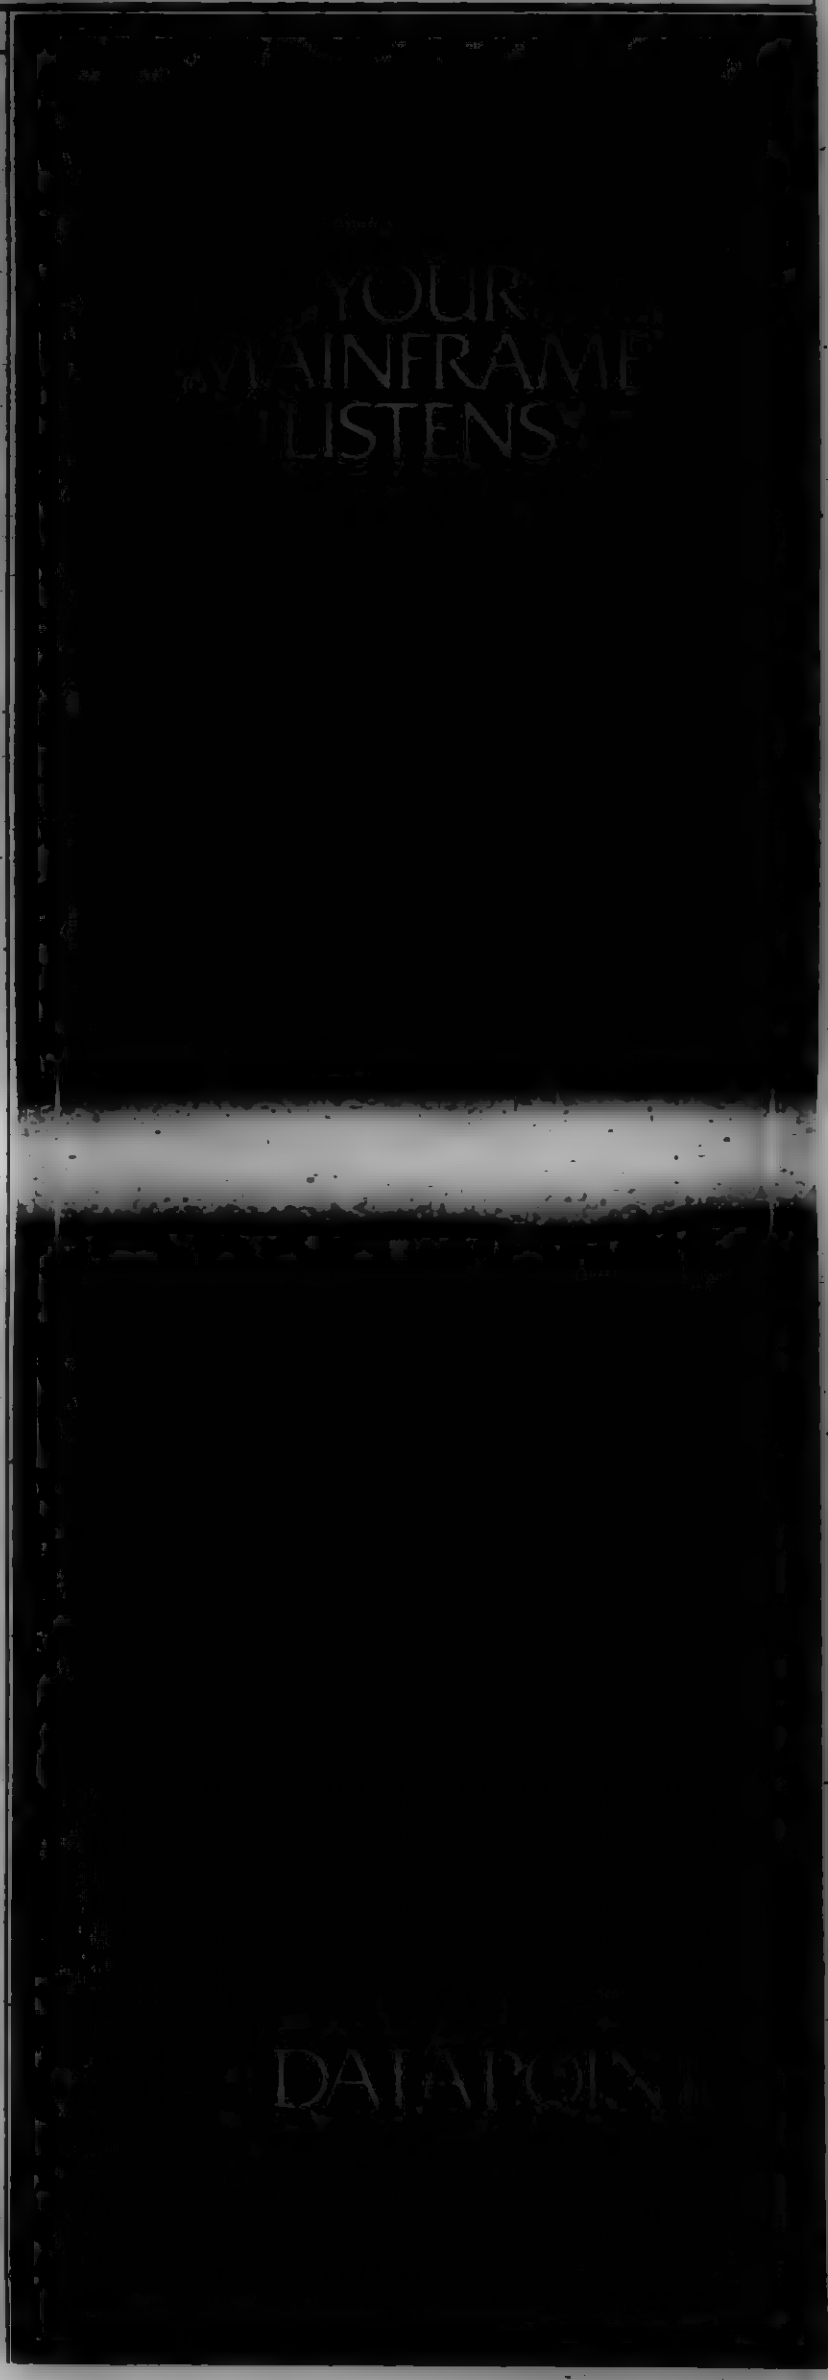
The personal computer service program is the first nationwide program under which a "loaner" computer may be offered for the duration of the repair, a GE spokesman claimed recently. Next-day delivery of equivalent hardware is provided under the loaner program, he continued.

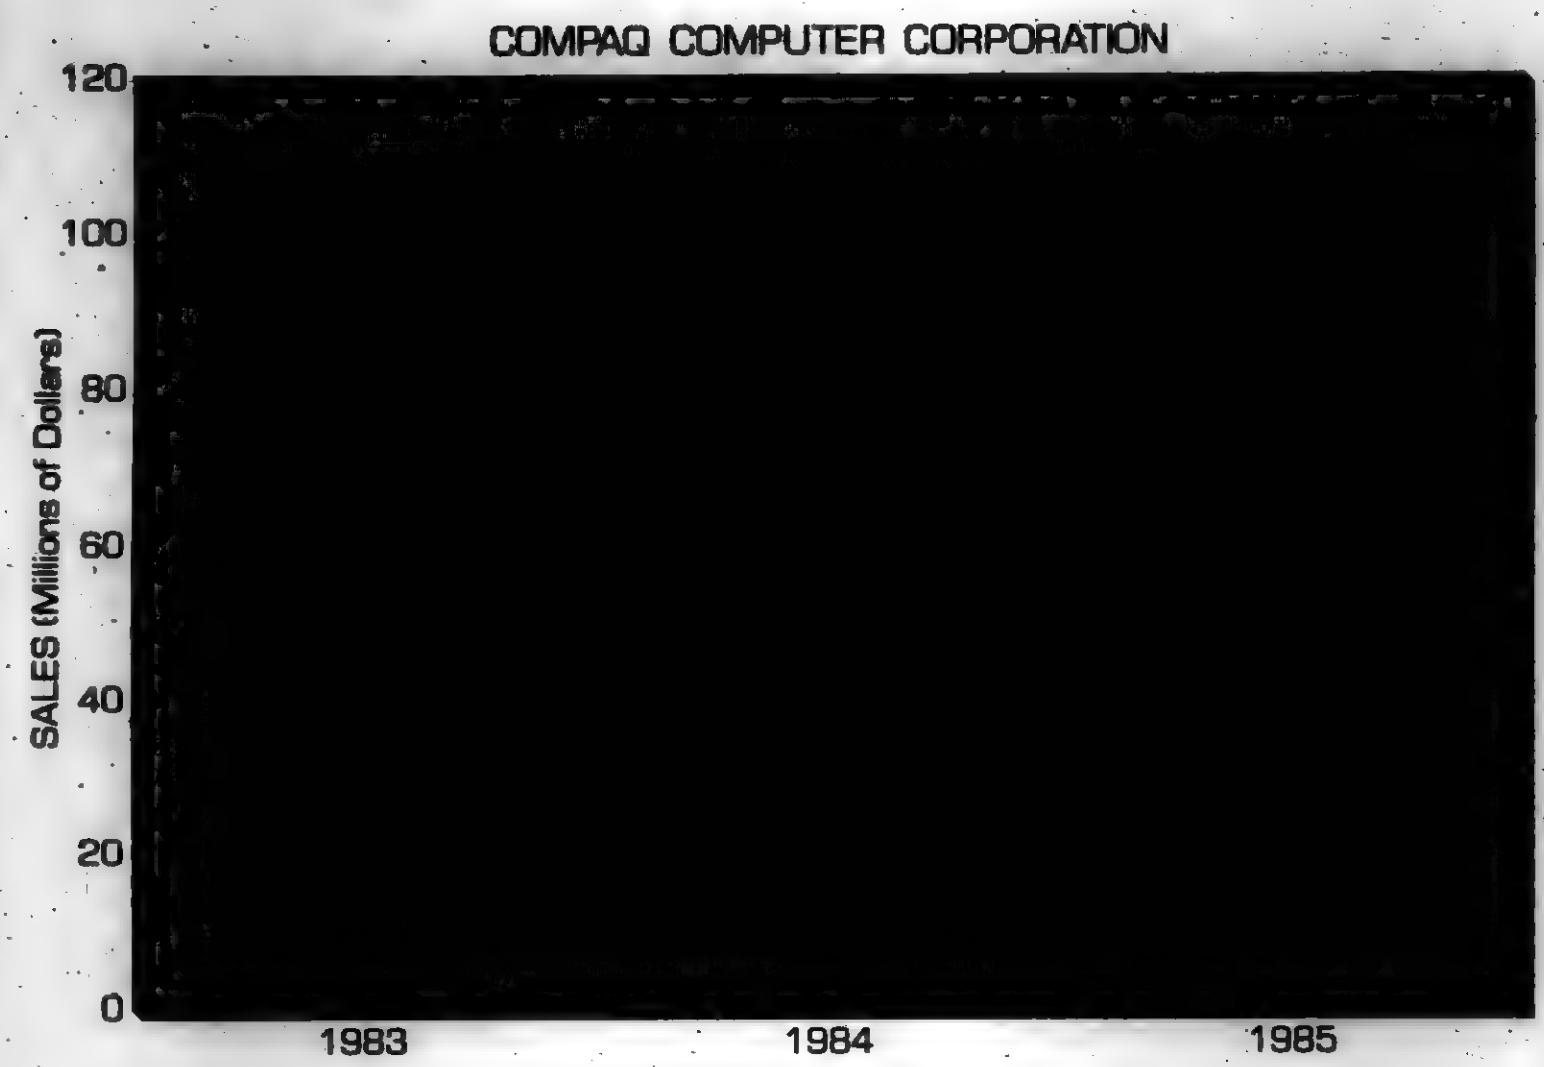
Among the personal computers that GE said it will service are IBM's Personal Computer and Personal Computer XT; Apple Computer, Inc.'s Lisa series, Apple IIes and IIIs; and computers from Hewlett-Packard Co., Compaq Computer Corp., Kaypro, Inc., Digital Equipment Corp. and Wang Laboratories, Inc.

In most areas of the country, GE said it offers on-site personal computer service at the customer's place of business or carry-in service through a nationwide network of GE service centers. Other service options available include annual service contracts and service center (depot) repair with or without the provision of a loaner computer or transaction service, which is a per-incident repair at a pre-established rate.

GE also provides equipment leases and rentals, service and repair of minicomputers, printers and data communications equipment and private branch exchange and data communications networks.

ICSD is located at Building 4, Room 300, 1 River Road, Schenectady, N.Y. 12345.





No other company can make this statement.

COMPAQ® Computer Corporation had the most successful first year in the history of American business.

We sold $111 million worth of the COMPAQ Portable and COMPAQ PLUS™ personal computers.

What made them so successful? They simply work better.

They work better because they're truly IBM®-compatible. So they run all of the most popular, most useful programs. And because they show high-resolution text and graphics on the same built-in display. And because we built them compact and rugged enough to be portable. And versatile enough to grow with you: Both take IBM-compatible boards. And the COMPAQ Portable can be converted to the COMPAQ PLUS with its integrated ten-megabyte disk drive.

By offering more capabilities than most personal computers, the COMPAQ Portable and COMPAQ PLUS have quickly earned a reputation as the most productive personal computers on the market.

What statement will we make in 1984? Our customers will have the final say. Yet in a recent survey, 98 percent of COMPAQ Computer users said they would recommend them to a friend. We like to think they'll say what we say: "It simply works better."

Victor's European distributor offers bail-out proposals

By Patricia Keefe
CW Staff

SANTA CLARA, Calif. — The European distributor for Victor Technologies, Inc. has offered two bail-out proposals to the troubled micro maker, currently in the throes of Chapter 11 bankruptcy proceedings.

Applied Computer Techniques PLC (ACT) of Birmingham, England, had given Victor, its creditors and lawyers until March 1 to respond to its offers. At press time, representatives from both firms were not available for comment.

One bid attempts to acquire the exclusive worldwide manufacturing and distribution rights to Victor products; the other less comprehensive proposal seeks acquisition of long-term full rights to manufacture Victor products in the UK.

ACT has been selling about 1,200 Victor (called Sirius in Europe) machines a month there and has an installed base of 25,000.

The latter bid reflects ACT's desire to protect its customer base and ensure a supply of Victor products, according to Christopher J. Buckham, president of ACT (North America), Inc., the company's subsidiary here. The first bid is seen by some industry observers as a buy out of Victor.

If accepted by Victor officials, either proposal could be financed from existing resources, Buckham said. These proposals are the only formal offers that Victor has received thus far, he explained.

The British computer maker also manufactures a computer called Apricot at its facilities located in Scotland.

If its offer is accepted, Buckham acknowledged that production of Victor computers could be moved to Scotland, resulting in the layoff of most if not all of Victor's roughly 500 remaining employees.

GUARD from page 109

tended for diskette-based software and would allow users of the software it protects to make an unlimited number of backup copies — but only for use on one computer, according to Heather Anderson, marketing assistant for Software Protection.

According to International Data Corp., a marketing and research firm based in Framingham, Mass., software piracy cost the software industry about $2 million in 1983 and will cost an estimated $4.5 million this year.

According to Anderson, software-based protection schemes, such as code words and fingerprint identification, are vulnerable to being broken. The company believes "a lot of software is being held back until good software protection comes out," because of confusion over judicial rulings on software.

Anderson said software publishers contacted about Copyrighter "think it's the way to go." But Chris Morgan, vice-president of communications for Lotus Development Corp., manufacturers of Lotus 1-2-3, said he couldn't recall having heard of Copyrighter, although "the principle sounds very good."

Jonathan Prusky, marketing manager for Microsoft, Inc.'s Microsoft word program, said he hadn't heard of Copyrighter either and expressed concern that software vendors that do adopt the system will be limiting their market, since software protected by that method will only run on what will initially be a few machines. "It's a catch-22," he said. "We are not going to limit our market."

Prusky did say he believes "the only type of protection that is unbreakable is a hardware scheme," and noted that one publisher of software for the IBM PCjr has been using that machine's

FORECASTS AND PERSPECTIVE

Breakup could aid Japan

The breakup of the Bell System will open the U.S. market to a flood of Japanese telecommunications equipment and will allow Japanese suppliers to capture as much as 40% of the U.S. private branch exchange market by 1988, according to "Japan in the Telecommunications Market."

The 174-page report from Northern Business Information, Inc. claims the AT&T divestiture has changed the U.S. telecommunications market in ways that benefit the Japanese.

According to the report, NEC America, Inc. is the Japanese company in the best position to capture a large share of the U.S. telecommunications market, having fully revamped its subscriber switching line during the last two years.

The report costs $995 from Northern Business Information, 66 W. Broadway, New York, N.Y. 10007.

Inertial guidance for robots

Industrial robots will soon be equipped with gyroscopes and inertial positioning devices, according to International Resource Development, Inc.

In a recently published 135-page report, "Inertial Guidance and Advanced Positioning Systems," the market research firm claims that efforts also are being made to build affordable plastic gyroscopes for automobiles, forming the basis of possible self-navigating cars in the future.

When built into industrial robots, the inertial guidance equipment, coupled with vision and collision-avoidance electronics, will reportedly enable future industrial robots to "go almost anywhere and do almost anything a human worker does."

Priced at $1,650, the report is available from International Resource Development, 30 High St., Norwalk, Conn. 06851.

Micro communications boom

The market for personal computer communications hardware, software and services will grow from about $300 million today to $1.4 billion by 1987, according to "The Personal Computer Communications Market."

The 222-page report by Frost & Sullivan, Inc. claims that circuit boards and associated equipment that allow personal computers to emulate IBM 3270-type terminals are the largest single hardware category, accounting for $76 million in 1983 sales. Sales in this area will hit $395 million in 1987, the report concludes.

Twenty-nine hardware vendors and their products are profiled in the report, along with 20 software firms and 12 information services companies.

The report, priced at $1,475, is available from Frost & Sullivan, 106 Fulton St., New York, N.Y. 10038.

Info services mart profiled

The market for cross-industry, stand-alone, generic personal computer software will decline substantially during the next five years, but the overall software market will show tremendous growth, according to "U.S. Information Services Industry, 1983-1988."

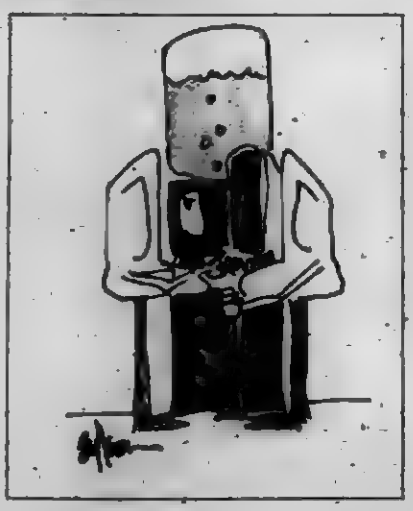
The two-volume, 500-page report from Input, Inc., a computer market research and planning firm, also claims that the market for batch processing will decline by 3% annually through 1988, based on a projected 6% annual inflation rate. Batch processing is on the decline for three reasons: an increasing demand for on-line response, the availability of inexpensive, powerful hardware and the proliferation of low-cost, quality software, the report concludes.

The report costs $2,500 per volume, or $5,000 for the set, and is available from Input, 1943 Landings Drive, Mountain View, Calif. 94043.

Price not all-important in OA

Reliability, available features and ease of use are more important considerations than price when a company is considering purchasing office and communications equipment, according to "Office Automation Survey: Analysis of Acquisition and Use of Office and Communications Equipment."

The survey from Venture Development Corp. cautions manufacturers against the use of the "price pitch" when trying to sell advanced office products. Manufacturers who sell through independent dealers and who also may have experience in consumer electronics tend to place too much emphasis on price, the survey indicated.



Computerworld presents the three most important factors in creating the #1 specialized business publication in the United States:

Factor 1 **Great Editorial.** When you ask $44 a year for a subscription — the editorial better be worth it. Ours is. Because we hire journalism skills first and computer industry background second. Our writers instinctively recognize the lead in a story. They can smell another story when they haven't even completed the one they're working on. They know how to interview; how to get the source to reveal facts that never were intended to be released.

Factor 2 **Great Editorial.** Our writers are pros at giving our readers what they need because they go where our readers are. They go to the same seminars, conferences, manufacturers' training programs and trade shows. And they don't just listen with our readers — they listen to them. So our readers get responsive editorial. And they regularly vote *Computerworld* "most useful publication" — both in our own studies and in those done by independent organizations.

Factor 3 **Great Editorial.** Because *Computerworld's* editorial department is supported by subscription revenue, our writers know who they're working for. They write the stories our readers need to see — independent from our advertising. And our advertisers appreciate our reputation for editorial integrity as much as our readers do.

Editorial. It's the most important factor in developing *Computerworld* as the #1 specialized business publication in the U.S. And you'll find that our sales people know as much about our readers and our marketplace as our writers do. They'll be happy to give you the facts, the numbers and a first-class overview of the marketplace. Just call Don Fagan, Vice President, Sales at 1-617-879-0700.

COMPUTERWORLD
THE NEWSWEEKLY FOR THE COMPUTER COMMUNITY

The survey includes information about ownership levels and the installed base, by manufacturer, of 13 products.

The study costs $1,950 from Venture Development, One Washington St., Wellesley, Mass. 02181.

Micro printer shrugs?

Vendors of microcomputer printers may be in for hard times in coming years despite booming sales of microcomputers, according to International Resource Development, Inc. A 174-page study, titled "Microcomputer Printers," concludes that trends toward micro networking, price cutting, slim margins and a lessening product differentiation are some of the major problems facing printer vendors.

The study describes major printer technologies and provides an analysis of printer markets and supplier structure. It also includes 10-year market forecasts.

The study costs $1,800 from International Resource Development, 30 High St., Norwalk, Conn. 06851.

Portable use to climb

The use of portable microcomputers will grow rapidly among major U.S. corporations by the end of 1985, according to "Microcomputer Usage Trends in 'Fortune' Corporations."

The 200-page report from Newton-Evans Research Co. contains details of a first-quarter 1984 survey of 150 DP and MIS executives from more than 150 Fortune-type corporations. The survey found that the use of portable microcomputers among these companies will grow from 2.5% presently to about 7% by the end of 1985.

Half of the responding organizations cited a need for integrated software. About 60% of the respondents believed that micro-based data base management systems are "very important" or "important" to their companies.

The report costs $750 from Newton-Evans, Suite 204, Bethany 40 Center, 10176 Baltimore National Pike, Ellicott City, Md. 21043.

GSA from page 111

contracts, which are indefinite-quantity contracts allowing the government to buy from an approved, preestablished price list. However, the GSA store offers many more services than are normally available under the GSA schedules. In addition, since GSA issued special regulations for store purchases, the store is also more convenient than competing private stores.

Jim Baroff, vice-president of Banana Computer, a local retailer, said his government sales have dropped since the store appeared. "I'm glad a small firm like The Math Box won the contract, but I don't think the government should be in competition with the private sector," he said. "The store is in a preferred position to sell to the government and has a captive audience. It represents a departure from procurement techniques meant to promote fairness."

Banana now sells through a GSA schedule. However, because of a change in GSA policy, Banana will not be able to market micros under GSA's general-purpose DP schedule next year. This will erode the competitiveness of Banana and other local retailers and heighten the GSA store's marketing advantage.

The store's impact will multiply if GSA decides to open stores in its regional headquarters. GSA's Fraser would not say whether GSA definitely plans to open new stores, although he admitted that the regional offices are clamoring for stores of their own.

Fraser did say that GSA is now considering expanding the store's product line to include office telecommunications equipment.

The store is also affecting federal microcomputer policy. Many individual users come to the store looking for advice on what to buy. Depending on the store's response, this could work to contradict the growing concern in government to coordinate micro procurement to ensure overall compatibility with agency policy.

Simware Delivers Protocol Conversion, PC Support ... and more.

Unique communications software
SIM3278™ is the unique, low-cost software communications package that transforms micros and ASCII video display terminals into simulated full screen 3278s. What's more, SIM3278 installs in minutes on VM or MVS systems, works with most terminals, supports from one to a thousand workstations, and operates without any additional hardware or software modifications.

More than just a protocol converter
SIM3278™ is loaded with extras no hardware converter can provide. Features such as on-line help, personal computer support, and a session manager that allows each workstation, including real 3270's to initiate up to 12 concurrent interactive sessions.

The Micro-to-Mainframe link
SIM3278™ has the added capability of providing the full screen micro-to-mainframe link for most personal computers, without having to install additional micro boards. Extended features for the IBM Personal Computer include attached printer support and file transfer during full screen operation.

SIM3278 from Simware
Today's cost-effective software solution. Get all the details and arrange for a trial demonstration today. Call (613) 235-6736

Panic over foreign competition discouraged

By John Gallant
CW Washington Bureau

WASHINGTON, D.C. — U.S. Department of Commerce Secretary Malcolm Baldridge recently urged American industry not to "panic" about foreign competition and not to rush to embrace trade protectionism.

Baldridge told a joint high-technology/basic industries policy conference here that a developing climate for economic health, an increasingly technically competent work force, plus management-labor cooperation is enhancing American industrial competitiveness.

Still, the Commerce secretary said U.S. management must be more flexible and show the "imagination and discipline" that other countries, particularly Japan, have shown in adopting new technologies in the work place. "We're not improving as fast as we once did. We're not failing," he said, adding that "other [nations] are catching up."

Anthony C. Stout, whose Government Research Corp. cosponsored the two-day gathering, told the conference that changing economic and industrial trends are "forcing on Washington a policymaking decision." New policies are needed, he said, but the different agendas of the two powerful constituencies of labor and high technology have "paralyzed" the government.

Saying the government is very responsive to its constituencies, particularly during an election year, Stout explained the conference was called to find areas of common ground between those two agendas before the political parties draft their political platforms at their national conventions this summer.

The conference was cosponsored by several industrial and high-tech associations, including the American Electronics Association, the Computer and Business Equipment Manufacturers Association, the Electronic Industries Association and the Scientific Apparatus Makers Association.

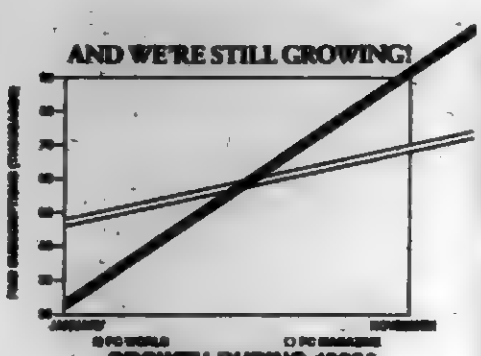
Baldridge, calling high technology "our last bastion of strength," said "too many of our companies are too timid" to adopt modern technology. He added, however, that he sees that changing. "Managers are becoming more flexible because they have to." Companies have "trimmed management fat," making them "leaner" and "more ready to compete," he added.

"We see management making progress," Baldridge said, explaining that technically trained people are beginning to take over companies from "the marketing types, the financial types."

Labor is beginning to cooperate more with management, Baldridge continued, which has helped fuel greater American productivity. He said the U.S. still has the highest productivity levels in the world, which helps offset higher wages. Japan, which is using lower wages and high-tech industrial processes to increase international competitiveness, still has productivity levels only two-thirds those of the U.S., he said.

Increased technological innovation and continued management-labor cooperation are the keys to maintaining American industrial leadership, Baldridge said. He urged U.S. business to eschew protectionism as a means to fend off foreign competition.

PC WORLD
HAS MORE READERS



IT'S A FACT: More people read *PC World* than any other IBM personal computer magazine.

In ten short months, *PC World* achieved a paid subscription base of more than 88,000 readers. After TWO YEARS the closest competitor, PC Magazine, had only 67,500 subscribers.

With their subscription dollars, readers have voted *PC World* #1 in its field.

And why shouldn't they? *PC World* is the best. We have the best writers, the best editors, and the best design. In a recent survey we found that 8 out of 10 *PC World* readers read every issue and that 93% rate *PC World* as a quality publication.

With every passing day *PC World*'s subscription leadership increases. We have the highest growth rate of any magazine in America. That's all you need to know when you're looking for the #1 IBM personal computer magazine. You can bet on *PC World* and win.

Call *PC World* today and find out what so many satisfied advertisers already know—it pays to go with the best.

*Claim statistics compiled from statements of ownership, management and circulation filed in October 1983.

TRILOGY from page 109.

expected. What is a little harder to swallow is a decision, far into the development stage, to redesign the basic technology and come up with an entirely new plan for how that technology will be configured into an actual machine.

Oh to have been a fly on the wall of the Trilogy boardroom when these decisions were made.

One has to wonder how Gene Amdahl and compatriots balanced off their own goals with the heavy-money concerns of DEC and Sperry. Serving two masters in addition to oneself can lead to ulcers; it must be expected that the two investors must surely be intent on playing a larger role in the decision-making process.

Just as would-be president Mondale is staggering under the load of union and big government endorsements, Trilogy from here on out is going to be scrutinized to see just who is going to call the shots over the long haul.

When you purport to be the coming savior, people tend to expect much more than most messiahs can produce. That can lead to serious problems when the savior turns out to be only human.

March 13 meet to cover U.S.-Japan ventures

SAN FRANCISCO — U.S. and Japanese business leaders and others will examine the growth of joint ventures between major corporations from both countries during a conference scheduled for the Fairmont Hotel and Tower here March 13-14 by The Conference Board, a nonprofit business information service, and the Japan External Trade Organization, a promotional body under the jurisdiction of Japan's Ministry of International Trade and Industry (MITI).

Sessions will include an analysis of pros and cons of technological cooperation, actual experiences, attitudes toward the role of government and prospects for cooperation in biotechnology, robotics and aerospace.

Speakers will include: David Packard, chairman of Hewlett-Packard Co.; Kaji Kobayashi, chairman and chief executive officer of NEC Corp.; Soichi Ishizaka, adviser to Nomura Research Institute and a former director of a MITI agency; and Sherwood L. Fawcett, chairman of Battelle Memorial Institute.

Conference registration fees are $515 for associates of The Conference Board and $565 for nonassociates. Information is available from the Board at 845 Third Ave., New York, N.Y. 10022.

CURTIS 1000 GIVES CORRESPONDENCE A CLEAN BREAK

When the computer helps out with your letters, make sure you don't end up looking rough around the edges. For correspondence with a personal look, Curtis 1000 makes a broad line of Clean-Cut letterheads, microperforated with laser-honed equipment. Curtis 1000 Clean-Cut comes in a wide variety of papers, including the popular Classic Laid. And, of course, Curtis 1000 can custom design Clean-Cut letterheads especially for your company. And Curtis 1000 offers Clean-Cut forms, too. But Clean-Cut letterheads and forms are just part of our mile-long list of products—including files, envelopes, and word and data processing supplies—that help you get the word from person to person, department to department, and company to customer. Curtis 1000. We supply the things that make business work. And we've been at it for over a hundred years.

1000 DIFFERENT PRODUCTS TO MAKE BUSINESS WORK

For samples, call your Curtis 1000 representative or write Curtis 1000 (CW-CC), Smyrna, Georgia 30080.

Tech growth seen in need of $1 trillion

NEW YORK — The information industry will need a capital infusion of $1 trillion to sustain its burgeoning growth through 1995, but will find itself competing with the federal government in a tightening credit market, two industry analysts believe.

The analysts recently predicted the industry will double its current contribution to the nation's gross national product by the end of that period and said its highest growth segments will be computer and office equipment manufacturers, telephone and telegraph services and makers of electronic components. They said these segments will increase their revenues by 250% by that year.

The analysts, Robert M. Kavner and W. Bowman Cutter, are cochairmen of the information/communication industry specialization program at Coopers & Lybrand, an accounting and consulting firm.

The three fastest growing markets, they said, will also be the ones most hungry for financing from 1985-1995. "It's likely these companies will be competing head-on with the U.S. Treasury for funds," Cutter said.

Those industry segments will be crying for capital, he explained, largely because of the great gains in productivity they will make by using mechanization to replace labor in that decade. As a result, Cutter said, it was likely that there would be no more than a 60% growth rate for information industry labor, and "we cannot look to the information industry to solve the long-term unemployment problems."

Kavner, meanwhile, pointed out that the shifting of the marketplace will cause companies to seek out what they think are safe market niches in this period. But, he warned, "Finding a niche, regardless of the industry, is like hiding in plain sight and then not inviting the competition to follow in your footsteps.

"My observations," he said, "can be summed up in two misleadingly simple points: First, too much control causes risk avoidance, too little exposes the business to abuses; and second, timely, relevant and accurate information gives management the edge, while late and unwieldy financial information impedes the management process."

This need for up-to-date information is critical, he said, because the product life cycle is shorter.

If you sell large systems software — quick — what will all your prospects be doing on June 20, 1984?

They'll be looking through a great new reference guide to software vendors — the *Computerworld Buyer's Guide to Large System Software* being published on June 20. And you'll definitely want to be there.

Look at what the Buyer's Guide gives you:

You get a large audience with heavy purchasing responsibilities — more than 114,000 paid *Computerworld* subscribers in the U.S. These subscribers are concentrated in the large professional computer-using organizations that control 84% of DP/MIS spending in 1983 — $72.2 billion. And research shows these subscribers have a significant degree of purchase decision influence — ask your Buyer's Guide sales representative to show you the *Computerworld* reader profile for details.

Look at what the Buyer's Guide gives buyers:

They get a one-source, comprehensive listing of purchase information about applications, DBMS, and systems and utility software for use with mainstream data processing systems. They get **two kinds** of listings — vendor listings and product offerings. **And**, they get a whole range of feature articles and tutorials covering new technology, large system software trends and buying techniques.

Now that you know where software buyers are going to go next June, you can arrange to be there with an ad for your product or service — right when they're researching vendors! Ad deadline is May 4. To reserve space in this issue, call one of the sales offices listed below or call Ed Marecki, National Sales Director or Kevin McPherson, Product Manager.

Suit accuses Apple of stock fraud

SAN JOSE, Calif. — Three shareholders of Apple Computer, Inc. have filed a class action suit against the company alleging senior officers reaped $84 million from stock sales after creating unwarranted optimism about the Lisa workstation computer.

The suit alleges fraud and violations of state and federal securities acts and names 13 Apple executives and/or directors, including Chairman Steve Jobs and President John Sculley.

The suit was filed in the Santa Clara County Superior Court here by attorney William Lerach of the San Diego law firm of Milberg, Weiss, Bershad, Specthrie & Lerach.

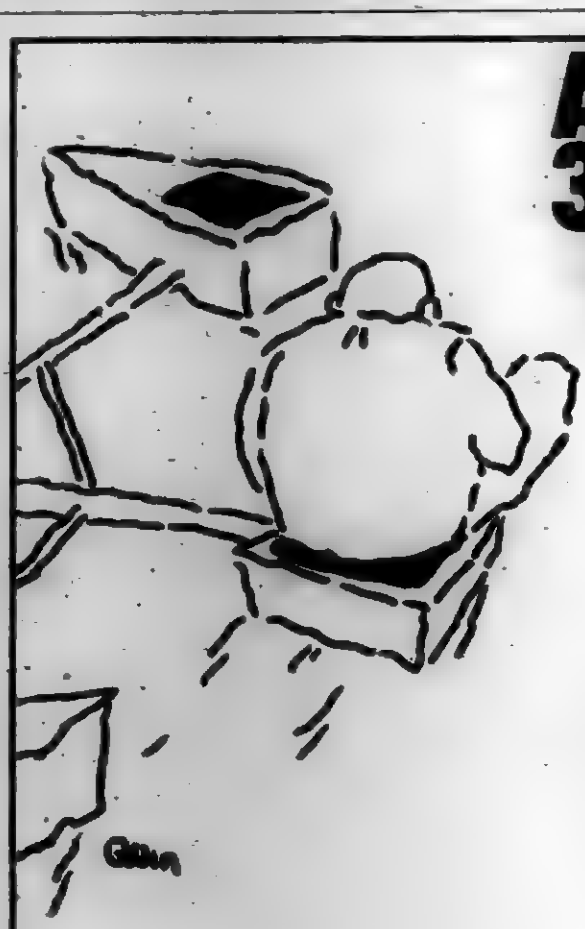
The three shareholders — William Schneider, a North Carolina resident who bought 25 shares of Apple stock, and Charles and Jeanne Cohn, Philadelphia residents who bought 150 Apple shares — alleged misleading statements concerning Lisa enabled the company's stock price to rise to $63.50 before plunging to $17.37 last fall, after the company announced a 73% drop in third-quarter earnings.

While the shares were at an "artificially inflated" price, the suit continued, the Apple officials, both present and former, sold 2.1 million shares resulting in gains of $84 million. The top seller, it asserts, was Jobs, who received $25 million on about 500,000 shares sold. Jobs has since confirmed these figures.

Despite claims the Lisa was a "revolutionary" and "phenomenally successful" new system that would "make Apple's growth before this look small," the suit alleges the product and the company were plagued by serious defects and difficulties that were known to the executives but not reported to shareholders.

Apple's general counsel, Al Eisenstat, said the company is presently reviewing the class action. "Our initial reaction is that the law suit is without merit, but we are certainly not considering it lightly," he added.

ANOTHER IBM 3274/76 USER AT THE HELM.



SORT OF.

The alternatives in printers for the IBM 3274/76 user could be categorized, basically, into two separate areas:

Take it, or leave it.

The AGILE 5287 Printer Protocol Converter allows you the intelligent alternative of a printer to suit your specific application. The flexibility to choose high speed printers, plotters, dot matrix, daisy wheel or even laser printers, provides you with the system control you intended. Pass the word: you're back in command.

Installation of the AGILE 5287 is simple. Its industry proven reliability, achieved through the 5287's built-in diagnostics, is backed by a full one-year warranty and a 30-day money back guarantee.

The AGILE 5287—call us for all the information necessary to make the choice.

MERGERS AND ACQUISITIONS

SKU, a national distributor of personal and small-business computer software headquartered in Berkeley, Calif., has been acquired jointly by McKesson Corp. of San Francisco and Actien Industries, Inc., Pittsburgh.

■

The Bank of America has announced plans to acquire Davenport Data Processors of Houston. Davenport Data Processors, a subsidiary of Kirby Exploration Co., provides online and batch processing applications to more than 100 companies in the Houston area.

■

Information General Corp. has signed a letter of intent to acquire Cyma Corp. of Mesa, Ariz. Cyma produces and markets microcomputer business software. Terms of the acquisition agreement will be finalized in March.

■

Scientific Micro Systems, Inc. (SMS) has acquired all the stock of Omti, a Campbell, Calif.-based supplier of Winchester-based microcomputer systems, storage systems and data controllers for Digital Equipment Corp.- and Intel Corp.-compatible markets. Omti will operate as an SMS subsidiary.

■

Computer Task Group, Inc., Buffalo, N.Y., has acquired Holvick Corp., a professional computer services firm headquartered in Detroit.

■

Visual Computer, Inc. of Tewksbury, Mass., a subsidiary of Visual Technology, Inc., has acquired Custom Computer Systems, Inc., Marlboro, Mass.

■

U.S. Tel, Inc. of Dallas and United Telecommunications, Inc. have announced jointly that United Telecom will acquire U.S. Tel through an exchange of one share of United Telecom common stock for each four shares of U.S. Tel common stock. U.S. Tel will be part of United Telecom's intercity communications group, United Telecom Communications, Inc.

■

Grumman Data Systems Corp. has agreed to acquire Ctec, Inc., a McLean, Va., computer software and systems engineering firm. Terms of the cash sale were not available.

■

Esprit Systems, Inc., Melville, N.Y., has announced an agreement in principle to acquire Percom Data Corp. of Dallas, a manufacturer of hardware and software for local-area networks.

■

Online Computer Library Center (OCLC) has acquired Avatar Systems, Inc. of Potomac, Md. Avatar will become a subsidiary of OCLC, known as the OCLC Washington Office.

■

Emulex Corp. has completed acquisition of Personal Systems Technology, Inc. (Persyst). Persyst will be operated as a wholly owned subsidiary of Emulex.

■

Xebec, Inc. and Evotek, Inc. have agreed to terminate discussions of a purchase by Xebec of Evotek.

SUPERSCRIPTS

Harris Corp.'s Lanier marketing operations in Europe, Africa and the Middle East are being integrated into Harris' Information Systems International Division, headquartered in Geneva. Lanier Business Products, Inc. merged with Harris in October 1983.

RCA Services Co. will provide third-party, on-site repairs and preventive maintenance for Pertec Computer Corp.'s System 3200 and 4200 series and the Pick & Associates, Inc. Pick operating system-based Pertec MC 68000 product line.

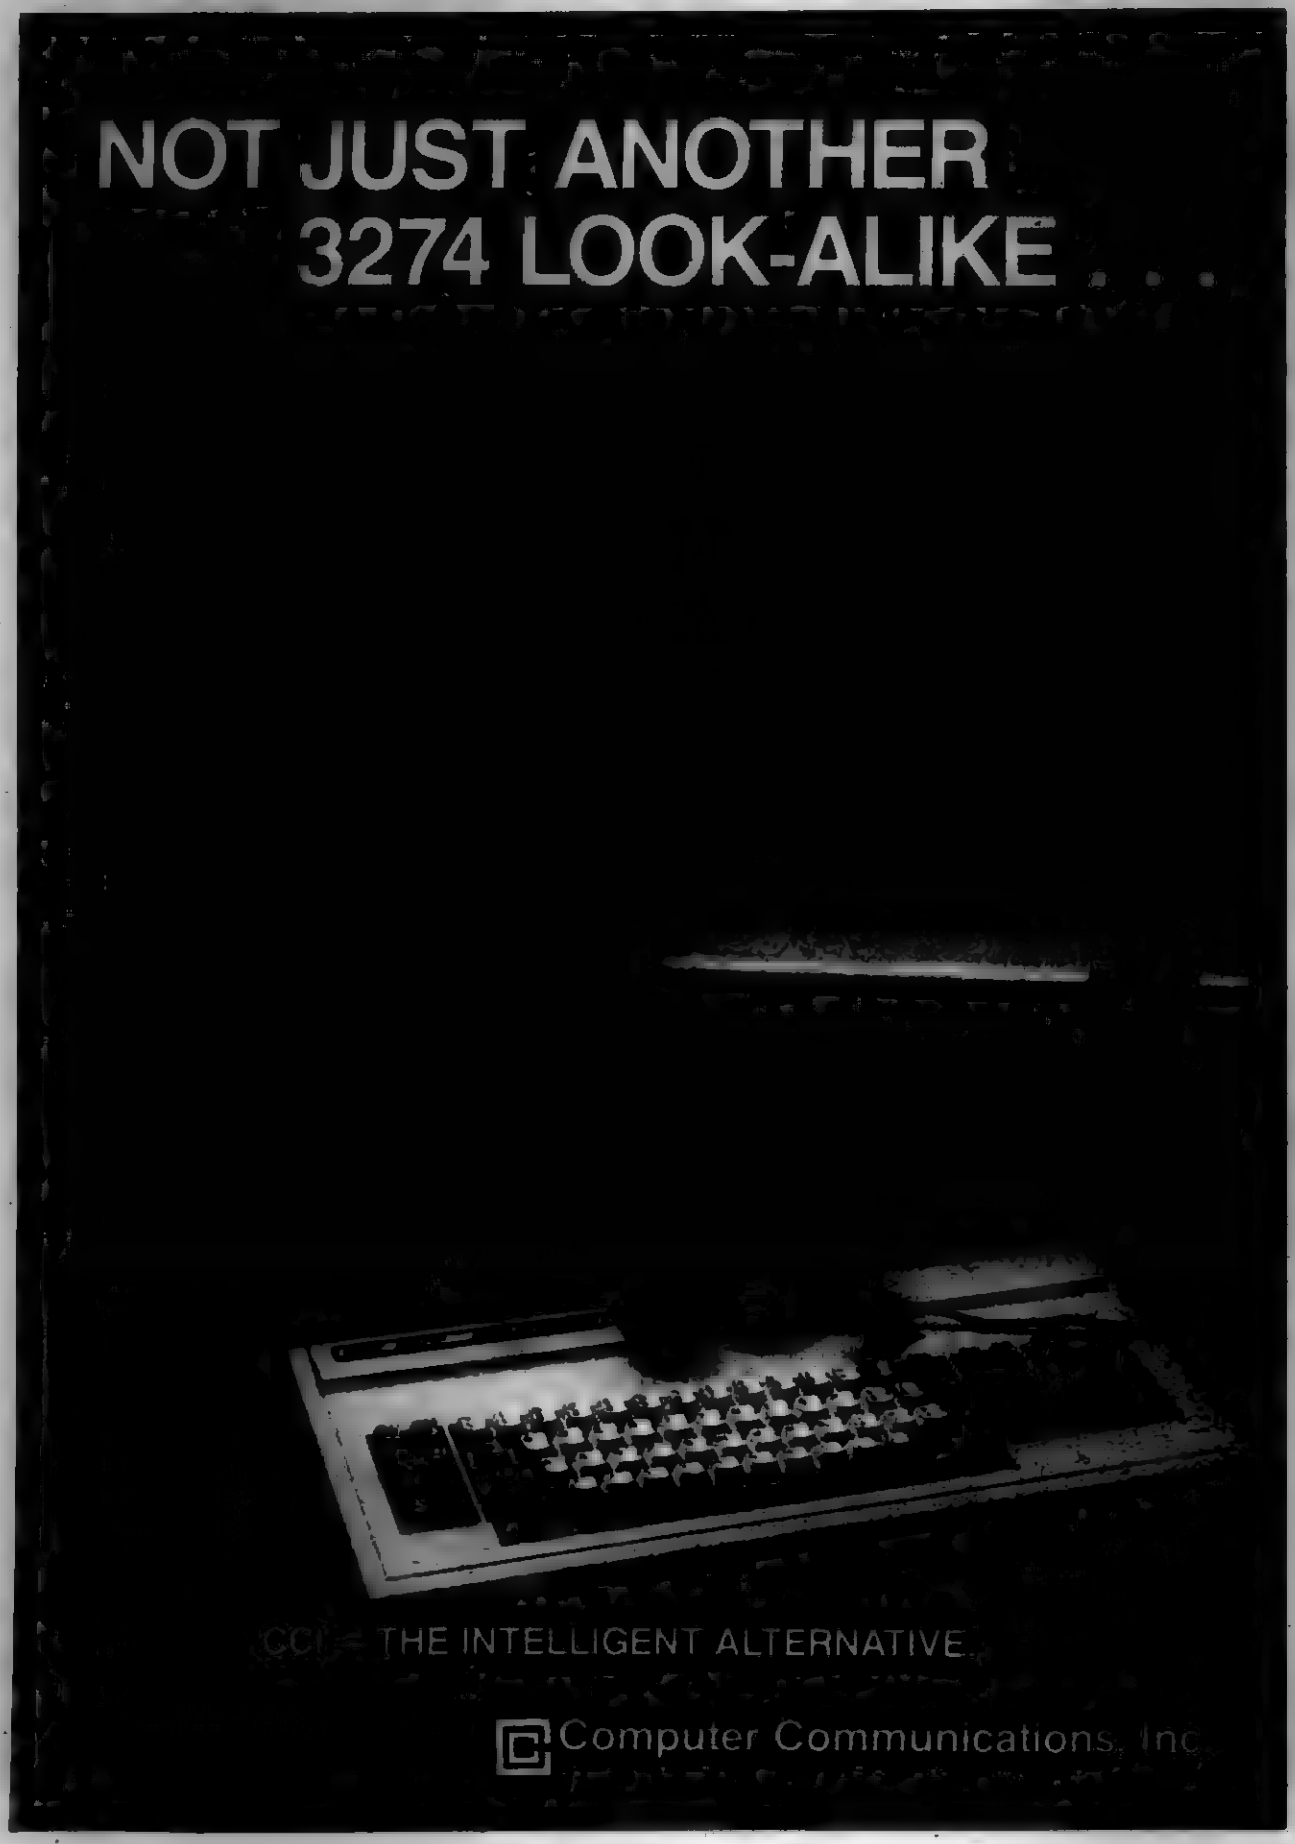
Crowntek, Inc. has announced formation of a new computer retailing subsidiary, Crowntek Technology Distributors, Inc. The new company has signed distribution agreements to handle IBM, Wang Laboratories, Inc., Sperry Corp. and Grid Systems Corp. personal computers and office systems.

Electronic Data Systems Corp. (EDS) has been awarded a contract by the U.S. Navy valued at more than $350 million over an eight-year period. EDS will replace selected computer systems by integrating hardware, software and a nationwide communications network, which will tie together remote job entry devices and several thousand CRT workstations. The contract includes two potential eight-year extension options.

Honeywell, Inc.'s Information Systems Customer Service Division has signed service agreements with Racal-Redac, Inc. of Westford, Mass., and Formative Technologies, Inc. of Pittsburgh. Honeywell will provide warranty service as well as third-party contract maintenance to customers of both companies.

Digital Equipment Corp. has agreed to manufacture, distribute and market Access Technology, Inc.'s Supercomp-Twenty, a spreadsheet for DEC computers including PDP-11, VAX, the Professional 300 series and All-In-One, DEC's integrated office environment.

The Harvard Business School announced last week that it will require the 780 students in this fall's class of first-year MBA students to use IBM Portable Personal Computers. The micros will be sold to students at a discount, and the cost is included in the roughly $17,000 expense for a student living on campus.



GUARD from page 115

game cartridge slot for users to insert a cartridge key, without which the company's diskette-stored software will not run.

Copyrighter protected software, Anderson said, would be encrypted by the software publisher program to scramble the software's machine code. Before the user could run the protected software, he would need to call an 800 number, supplied with the software, and receive a configuration code that would activate the Copyrighter decoding system.

The configuration code would permit the protected program to run each time the code is entered and, Anderson said, would allow unlimited numbers of backup copies of the program to be made, but only on the user's machine.

The Western Design Center, a Mesa, Ariz., microprocessor design firm, reportedly will design the new 16-bit CPU for pin-compatibility with the popular 8-bit 6502 microcomputer chip used in what may be as many as four million microcomputers, from the Apple Computer, Inc. Apple II to the Commodore International Ltd. Vic-20. This would reportedly upgrade 8-bit machines to run software applications designed for both 8-bit and 16-bit machines.

The potential market for the 6502-compatible, 16-bit upgrade chip is a large one, according to Steve Greenberg, spokesman for Commodore International. The 6502, he said, is the CPU for all Apple IIs, the Franklin Computer Corp. Ace, the Warner Communications, Inc. Atari 400, 600 and 800XL models and the Commodore International Vic-20. Should the upgrade chip catch on with performance-minded computer enthusiasts, "it's going to sell a lot of 8-bit computers," Greenberg said.

POSITION ANNOUNCEMENTS

DATA PROCESSING PROFESSIONALS

★ AUSTIN AREA ★

A golden opportunity to get in on the ground floor!

A leader in oil field instrumentation and industrial weighing systems has immediate openings in the Austin area for the following very special professionals:

● SYSTEMS ANALYSTS

Duties will include design, development and implementation of Manufacturing, Financial, Marketing and Distribution systems, performing systems studies, and developing systems proposals and cost justifications. Degree required, preferably in Computer Science, Marketing or Business Administration. Minimum of 3 years experience in systems analysis and design required developing batch and on-line data base applications. Experience with office automation applications also desirable.

● PROGRAMMER ANALYSTS

Duties include designing, developing and implementing batch and on-line interactive business application systems in Manufacturing, Finance, Distribution and Sales/Marketing areas. Needs degree, preferably in Computer Science, M.I.S. or Business with 3 years experience in COBOL (VSAM), DL/1, CICS, business applications.

● APPLICATIONS PROGRAMMERS

Duties will include designing, coding and testing of batch application programs, maintaining production programs. Needs degree, preferably in Computer Science, M.I.S. or Business, with 2 years COBOL (VSAM).

These permanent positions in the Austin area offer excellent salary, benefits and growth opportunity. Send resume and salary history in confidence to our company headquarters at: (Principals only.)

Senior Technical Specialists

Saudi Arabia

Booz·Allen & Hamilton, one of the world's most widely respected names in management and technology consulting has unique opportunities for experienced senior technical specialists to accept challenging assignments in Saudi Arabia.

As a professional with Booz·Allen, you will become a part of a world-class environment where your success is limited only by your abilities. These are long term career opportunities. The technical challenges are unsurpassed . . . and when your Saudi assignment is completed, you will continue to grow and develop within the Booz·Allen organization.

To qualify, you must have a technical degree and at least 7 years hands-on experience with all types of business systems applications. Knowledge of COBOL, FORTRAN and BASIC is required. In addition, your background should include the following:

- **IBM system hardware & software**
- **Telecommunications & network integration (SNA)**
- **ADP project planning management**
- **System life cycle development**

We offer an outstanding compensation and benefits package as well as the opportunity to develop your abilities to their full potential within a highly professional atmosphere. For more information and immediate consideration, send your resume, in confidence to: Ms. Judy Merkel, MISD, Booz·Allen & Hamilton, 4330 East West Highway, Bethesda, Maryland 20814.

DATA PROCESSING PROFESSIONALS

COME GROW WITH US!

The success of **Gold Circle** is a tribute to our talented and dedicated **Gold Circle** team, of which our high-caliber data processing professionals are a key part, making our ambitious growth plans a reality.

As a leading division of Federated Department Stores with 51 stores in 4 states and annual sales in excess of $800 million, we can offer you outstanding career opportunities in our Information Services (IS) department.

Our present equipment consists of an IBM 3083 Mainframe with an MVS-SP operating system, IMS DB/DC, CICS, ROSCOE, and TSO under VTAM/NCP, digital and analog network for EPOS/receiving to our stores. Here at **Gold Circle**, you'll find a state-of-the-art environment where you can meet your potential in the following areas:

INFORMATION SYSTEMS — Our IS professionals develop new user programs and systems in an environment where 70% of our systems resources are committed to new development of on-line and data base systems such as distribution, finance, EPOS, stores, receiving and sales. Needed in IS are:

PROJECT MANAGER — QUALITY ASSURANCE
PROJECT MANAGER — DISTRIBUTION SYSTEMS
SR. PROGRAMMER ANALYSTS **QUALITY ASSURANCE ANALYST**

INFORMATION PROCESSING — Providing Data Entry, Computer Operations, Production Control, and Technical Services functions to **Gold Circle**, this area uses state-of-the-art scheduling/production assurance techniques to ensure that service level objectives are met. IP's responsibility also includes system software such as the Operating System, Capacity Planning and Communications software. Needed in IP are:

SR. OPERATIONS ANALYST **MVS SYSTEMS PROGRAMMERS**

INFORMATION RESOURCE MANAGEMENT — Administering the use of our corporate information resource and providing tools for on-line access are primary duties of IRM. Additional duties are mangement of IS standards and guidelines, disaster recovery planning, IS training, and data security. Needed in IRM are:

IMS SYSTEMS PROGRAMMER **DATA BASE ANALYST**

Interested in these outstanding opportunities? Gold Circle believes in fast action. CALL COLLECT, Julie Smith, (614) 459-3589, Tuesday, March 13 through Friday, March 16, 9 AM — 5 PM (EST). Can't call us on those days? After March 16, CALL COLLECT, Julie Smith, (614) 438-5274, 9 AM — 5 PM (EST).

ASSISTANT VICE PRESIDENT FOR INFORMATION PROCESSING
University of Minnesota

The person selected for this new position will be the principal line officer for units and activities related to computing and telecommunications and will report to the Vice Presidents for Academic Affairs and Finance and Operations. The primary emphasis of the position will be on planning, coordination and management of these activities to serve the academic and administrative needs of the University.

Leadership and the responsibility for the University Computer Services, the Administrative Data Processing Division, and a new Department of Telecommunications Services to be established are major responsibilities of this position.

Candidates must have, as a minimum, a master's degree (Ph.D. preferred) in engineering, science, mathematics, management information systems, or comparable technical discipline; a minimum of five years experience in planning and management in the area of computer and/or telecommunications technology. Significant experience in a research university; understanding of and experience in conducting or supporting academic research, undergraduate and graduate education, or comparable experience in private or governmental laboratories.

Applications and nominations for this position are solicited and applicants should forward a resume, three letters of evaluation, and a personal statement in regard to the position *on or before April 20, 1984* to:

Dr. A.J. Lleek, Associate Vice President for Academic Affairs and Chair, Search Committee
213 Morrill Hall
100 Church Street S.E.
University of Minnesota
Minneapolis, Minnesota 55455

This is an administrative position of the University, with faculty benefits. Faculty rank and tenure status are possible in an appropriate academic department, depending on qualifications.

Salary: negotiable and commensurate with qualifications and experience.

The University is an equal opportunity educator and employer and specifically invites and encourages applications from women and minorities.

Systems Programmer

IBM 4341 • to $50K

An exciting opportunity exists within our banking institution's progressive data processing area for the right individual who possesses 5 - 10 years experience within an OS/VS-1, VM, CMS, CICS environment at the macro & command level. This individual must possess a solid knowledge base in COBOL, Assembler & PL1. Exposure to VSAM essential. We offer excellent benefits package as well as a stable shop environment in our conveniently located Central Nassau County, Long Island headquarters.

Qualified individuals may send resume in strict confidence to:

Box 888-S, 15 E. 41 St, NYC 10017

Communications Engineers and Programmers.

IBM in Boca Raton seeks Developers and Designers in both.

We are looking for a few exceptional people...

IBM Boca Raton is in the early stages of developing a family of information systems for the small to intermediate price marketplace. These products must achieve new levels of cost performance and quality, and will contain advanced facilities and functions establishing this effort as the *leading edge* throughout the latter half of the decade.

Engineering Development and Design

Communication Hardware Development

Must have knowledge of current microprocessor chip sets, communication and EDS technology, and extensive experience in development process—including ability to generate specifications, plans, etc.

Communications Microcode Development

Must have knowledge of communication protocols and modern programming development methods. Code will be developed using high-level language.

Communications Test Development

Knowledge of communications protocols required. Test cases, which will be developed with high-level language, will exercise all normal and exceptional conditions in communications HW and microcode.

Engineering opportunities also exist for Systems Architecture and Logic Design of VLSI Components.

Programming Development and Design

Communications Architecture

Will develop architectures for distributed systems communications. Must have in-depth experience with internals of communications architectures such as SNA and international standards for communication.

Communications Design

Structuring components within a distributed system framework. Must know SNA, X.25, LAN's or communications structures, and be able to map them to distributed system concepts.

Communications Product Development

Will implement communications products. Requires knowledge/experience in product detail design, high-level language development programming, and communications product testing.

The added attractions are many.

IBM offers outstanding technical resources and associates, company-paid benefits package, and opportunity to pursue advanced degrees. Boca Raton—between Ft. Lauderdale and Palm Beach—offers good living at quite moderate cost.

For prompt, confidential consideration, please send your resume to: IBM Corporation, Mr. Rick A. Thompson, Dept. 85B/234-1, P.O. Box 1328, Boca Raton, Florida 33432.

Texas

Information Center Analyst. Major San Antonio employer seeks a person with 4th generation language experience. 4-day work week. To $30,000.

Vendor Product Manager. Expansion of international and domestic markets has created multiple openings in San Antonio, Texas. Beautiful suburban location. To $45,000.

Diagnostic Software Specialist. New product development team needs an experienced professional. Beautiful suntech location. Low cost of living. To $50,000.

Engineering DBA — Ground Floor. Experience with any graphical data bases is needed in well-known San Antonio firm. Ground floor opportunity. To $45,000.

Software Engineers — Many Openings. Experience in visual/data combination equipment sought. Positions will lead to an exciting new product development teams. To $45,000.

Programmer/Analyst — Great Location. New development efforts have created a number of openings for people with PL/I or COBOL experience. Beautiful North/ San Antonio location. To $34,000.

CAE Software Engineer. Experience in CAD/CAM of printed circuit boards, could lead to several challenging career possibilities. Ground floor opportunity. To $45,000.

CICS System Programmer. Experience in CICS internals sought. Position will lead to a challenging opportunity in consulting. A real opportunity for a technical applications person. To $40,000.

Consultant — IBM Exposure. Software/ Consulting company is expanding and seeks IBM talent in these areas: structured COBOL programming and insurance agency experience. To $45,000.

Software Engineer. Technical degree, experience in firmware development sought by major Fortune 500 firm. Any exposure to Assembler and/or C helpful. To $40,000.

New Mexico

Programmer Analyst. Fast-growing, stable insurance company in new Scottsdale, Arizona facility. Design and program using CICS, COBOL and ALC. Minimum of 2 years IBM sought. Insurance experience preferred. To $30,000.

Programmer Analysts — IMS/Training. Fortune 100 client has major new development projects. State-of-the-art OS/MVS shop with professional environment, structured methodology. Programmer/ Analysts with two years or more experience using IMS DB/DC with COBOL sought. Also have development with PL/I and CICS for new on-line transaction system. Excellent training programs, benefits and career progression. Starting salaries: $33,000 to $37,000.

Operating System Engineers — Test Engineers. Leading-edge R&D group is developing next generation operating systems for the hardware vendor 16/32 bit microprocessors. Need person with UNIX and 'C' with structured high level languages design. Research environment, suburban location in Phoenix suburb. To $45,000.

Software Engineer — UNIX, 'C'. Start up company, developing software systems for the medical field. UNIX/C or Basey Intors ALC experience desired. Possible equity position. Live and work in Las Vegas. To $40,000.

Senior Programmer Analyst — Banking. Lead installation of new auto leasing package. State-of-the-art bank. Beautiful suburban Phoenix location. Prefer auto leasing experience and/or strong IMS with COBOL. Banking and ALC preferred but not required. Excellent path to Project Management. To $32,000.

Programmer Analyst — New Development. Very stable aerospace company located in Small Southwestern town. Will develop new systems. Person with four years COBOL and CICS with OL1 preferred. To $30,000.

Software Engineers — Multiform. Stable, growing division of Fortune 500 firm seeks person to lead hardware/ software integration projects with DEC PDP11 and 280 microcomputers using ASSEMBLER and C. Will be heavily involved with hardware interface, design, development, and test. Lead small groups — project start to finish. Starting salaries to $30,000.

DEC PDP 11-RSX Software Engineers. Real-time MACRO-11 development for major multiple CPU communications applications. Low cost of living area with temperate climate. Starting salaries: $30,000 to $34,000.

Systems Analysts/Programmers — New Projects. Huge growth local firm with migrate from DOS/VS to OS/MVS this year. Primary applications are on-line (CICS) inventory and financial for large base of user service groups. Will be involved with new database projects. Strong user skills and individual responsibility are key requirements. COBOL and ASSEMBLER experience is helpful but not required. Starting salaries: $21,700 to $24,000.

Software Engineer — Graphics. Leader in the field for 3-D graphics systems. New product development. BSEE, BSCS UNIX C ALC with exposure to graphics sought. Located in Scottsdale, Arizona. To $42,000.

Software Engineers/Managers — Will Cross-Train. High-tech electronic systems manufacturer is expanding staff for new development in UNIX/C on 80BX, M68000X microprocessors. Real-time operating systems, compilers, hardware control, software tools and application specialists are needed. Can train solid PASCAL/ ASSEMBLER experienced on UNIX and C. Prefers BSEE or Technical BSCS. Excellent company benefits. Starting salaries: $31,000 to $45,000.

Programmer Analyst — Las Vegas. Major bank in Nevada is expanding. Large scale Burroughs experience with COBOL preferred. Telecom and banking exposure sought. To $27,000.

Systems Analysts/Programmer Analysts. Fortune 500 headquartered in Phoenix needs staff to support user groups in developing new system developments to upgrade financial and inventory systems. Environment is large scale OS/ MVS using IMS and CICS with structured methodology. Sustained growth of departments and company over last five years has continually allowed internal promotions to fill senior positions. Starting salaries: $33,000 to $35,000.

Programmer/Analysts — 10 minutes from the Slopes. Major services firm needs Programmer/Analysts to support new hardware upgrades in 1984. OS/ MVS, CICS COBOL environment. Opportunity to enjoy the outdoors and live in a low cost-of-living area at the base of the Rockies. Starting salaries: mid to high twenties.

Programmer/Analysts — Systems 34, 36, or 38. Exciting opportunities in new development of financial and reporting systems for seven year old Phoenix firm. Professional staff has doubled in the last year. Multiple CPU's installed migrating from System 34 to System 38 with planned addition of System 38 as demand increases. Starting salaries: $28,000 to $30,000.

Texas

Operating System Specialist. Leading San Diego software firm seeks System Programmer with three to five years including IBM OS experience. Opportunity for exposure to multiply mainframe and minicomputer operating systems. To $30,000.

Marketing Director. One of the fastest growing systems/software developers seeks a successful Marketing Director to direct its staff based in San Diego. Will develop marketing strategies and motivate staff. To $55,000.

Major Data Center Expansion — Multiple Opportunities. Well-known San Diego firm is expanding on-line systems. Firm seeks Programmer/Analysts, System/ Analysts and DBAs, System Programmers (MVS, CICS, VTAM, IMS). Extensive in-house IBM training in database and on-line services. To $40,000.

Software Engineers — New Product Development. Rapidly-growing San Diego computer manufacturer seeks degreed individual with three years UNIX and 'C' programming experience. Assembler and VAX exposure helpful. Will develop new software. To $40,000.

Engineering Programmer/Analysts. Join a growing state-of-the-art San Diego firm. Openings exist for those with engineering or process control applications experience. Fortran knowledge, graphics and database exposure preferred. Great learning environment. To $40,000.

Software Engineer — Microprocessor High Technology. Major high technology manufacturer located in a rural setting minutes from San Diego seeks Microprocessor Software Engineers with three years of real-time software design experience on Intel 8080, Z-80, or Motorola 6800 using Assembler and PL/M. A BSEE or Computer Science degree helpful. To $40,000.

IMS Programmer/Analysts — Data Center Expansion. Major San Diego company with multiple IBM 360X and 3100 distributed processing environment is expanding its systems development staff by 100 people. Salaries to $35,000.

Senior Programmer/Analyst — New Project. Major division of Fortune 500 firm in suburban San Diego location seeks individual with two plus years IBM OS/ COBOL and CICS experience for a new development project. Opportunity provides high visibility with top corporate management as well as technical exposure. To $31,000.

CAD/CAM Programmers — Growth Potential. San Diego manufacturer, undergoing major expansion in graphics development, needs CAD/CAM Programmers. Will contribute and be rewarded immediately relative to level of contribution. Excellent management potential. BS, EE or BS, CS sought. To $40,000.

Programmer — Move To Consulting. Prestigious East Coast consulting firm is expanding in San Diego and seeks an aggressive Programmer desiring a career in analysis consulting. Opportunity for travel. State-of-the-art environment. Two years programming, good communication skills and Bachelor's degree sought. To $40,000.

Lead Systems Programmer — Management Opportunity. Major Denver-based financial firm seeks Programmer with CICS internals experience. Will become Manager in six months with proven performance. To $37,000.

Colorado

VTAM NCP — Project Leader — Data Center Expansion. Rapidly-expanding Denver division of major U.S. corporation seeks project lead experience or strong exposure to VTAM NCP systems programming. Expansion plans for 1984 will create multiple opportunities for rapid career development. To $40,000.

COBOL Programmer — HP New Development. Exclusive Source client seeks a COBOL Programmer/Analyst to join a select staff of computer professionals. This is a prestigious Denver firm showing a plush working environment, outstanding benefits and rapid career growth, including a 90 day salary review. One year of HP COBOL applications experience sought. Knowledge of packaged GA systems helpful. To $24,000.

Assembler Programmer — Learn CICS. Prestigious Denver firm with sophisticated network expansion plans for '84 is seeking IBM Assembler programmers. Promotion to first line management is obtainable in 12–18 months. Two-five years of BAL on large IBM systems sought. Online training will be provided. To $26,000.

Programmer — Move to Small Mountain Town. Manufacturing company located in the Rocky Mountains near major Colorado ski area has an immediate opening for a two year COBOL or RPG II Programmer. Company will provide training on HP 3000. Full relocation provided to this beautiful, rustic, mountainside community. To $25,000.

Applications Programmer — New Systems Development. Major insurance organization in Denver has multiple positions open due to expansion. Company is developing a new insurance processing system. Participate in a state-of-the-art on-line development project. Prefer backgrounds in insurance and IBM Assembly. To $25,000.

The Network of Tomorrow... Today at UNINET

While other companies are anticipating and planning for tomorrow, we are already there.

UNINET, a UNITED TELECOM company, is offering true state-of-the-art opportunities in the further development of our Fourth Generation Public Data Network. This network employs a fully distributed microprocessor architecture based upon 80186 and 80286 processor modules in a four-level bus hierarchy.

We offer the unique opportunity to apply your expertise in support of the design and development of a Public Data Network that achieves sophistication in high-level protocols and data switching rates unattainable under previously available technologies. We see this as a major breakthrough in providing a practical solution to today's business communications problems.

NETWORK SCIENTISTS

Immediate opportunities for applied research exist in the areas of:

- **Packet and message switching strategies**
- **High-level network protocols including routing and congestion**
- **Incorporation of satellite facilities into backbone services**
- **Evaluation of theoretical topologies**
- **Analysis of algorithms**
- **Network management and control**
- **Protocol translation schema**

UNINET offers an environment which encourages creative applied research and development addressing the most current opportunities in data networking. Candidates possessing advanced degree in Computer Science and Mathematics with significant experience in network architecture and network design are encouraged to apply.

DATA NETWORK SOFTWARE ENGINEERS

Immediate opportunities exist for the development of:

- **Network Configuration and Control Systems (VMS)**
- **Network and Access Control Systems (RMX)**

Candidates should have a strong background in the implementation of CCITT packet network protocols or network management and control protocol. Applicants desiring positions in network access engineering should possess detailed knowledge of X.3, X.28, X.29 and X.25 as well as synchronous DTE protocols. SNA experience is considered desirable. Degreed computer scientists with formal software engineering experience are encouraged to apply.

SALES REPRESENTATIVES

Positions require a proven track record in sales of data communication or time sharing services, or computer hardware and software to Fortune 1000 companies. A generous compensation package insures that you will be compensated in direct relation to your efforts.

All positions require an energetic, entrepreneurial spirit which will be recognized and rewarded. A background in communications coupled with excellent written and verbal skills and a BS or BA degree will qualify you for these opportunities. An MBA is preferred.

Positions currently available in San Jose, Los Angeles, Minneapolis, Houston, and New York in addition to Kansas City.

MANAGER, BUSINESS PLANNING

This key management position requires an extensive background in marketing, strategic planning, financial analysis and management, in addition to:

- **Technical Bachelor's Degree (BSEE, Math, Engineering)**
- **MBA (Finance, Economics, Marketing)**
- **Excellent written and verbal communication skills**
- **High Technology industry experience (communications)**

Your primary responsibility will be to serve as the catalyst for developing short and long range business plans and strategies. Major emphasis will be placed on the ability to bring your technical expertise in the communication industry to the planning process. Skills in acquisition and joint venture analysis are essential, as is the ability to coordinate effectively with other operational units. This is a highly visible position, with responsibility for the design and implementation of strategic plans which will positively impact corporate revenues and profit growth.

INTERFACE '84 ATTENDEES...

Call Us During INTERFACE '84 In Las Vegas To Schedule Your Interview...

(702) 798-3488

Our representatives will be in Las Vegas during Interface 84 to identify and interview the most talented candidates for our diverse opportunities. Even if your expertise lies in another area of data communications or computer networking, we should discuss our current openings. Call UNINET in Las Vegas any time, from Sunday, March 11 through Thursday, March 15.

If you feel your qualifications can contribute to the further development of our network, forward your statement of qualifications in confidence to:

It's a Breakthrough! ...In Systems and Careers.

[redacted]

The Hospital Patient Management System of Dynamic Control represents a breakthrough in hospital information control. Our resulting success can represent a breakthrough in your software career if you qualify to join us.

PROGRAMMERS PROGRAMMER/ ANALYSTS – Make the most of your experience in RPG II on System/3 or System/34 or RPG III on System/38 in an interactive on-line environment. We require a minimum of 2-3 years programming experience.

Positions available in Development, Installations, Pharmacy, and Customer Support.

FINANCIAL INSTALLERS – You will work with hospital financial staffs to assist with the installation of automated financial and accounting systems. Other duties will include training of hospital personnel and systems modifications. Two-three years accounting experience and/or financial implementation of automated systems is required.

Meeting new challenges and finding solutions takes the ability of a skilled professional. In accordance, we provide an excellent salary, complete benefits, RELOCATION ASSISTANCE, and opportunity for further professional advancement. To apply, please call Personnel, TOLL FREE, 1-800-327-5352, or from within Florida, call COLLECT 305-671-6453. If unable to call, send resume to: Personnel Department, 1311 S. Semoran Blvd., Winter Park, FL 32792.

Dynamic Control

A division of Transnet Laboratories, Inc.

An Equal Opportunity Employer M/F

$80,000/YR.—CICS PROGRAMMING

Acquire one of the most demanded & rewarding programming skills in months instead of 2 years! A complete & practical guide to CICS Command Level Programming. It's based on CICS latest release 1.6, written on COBOL, with special emphasis on VSAM. Brand-new 2nd edition, contents printed in two colors, handsome mylar-coating cover. 150 examples illustrate use of CICS commands. 15 complete CICS programs address all major applications. Sample programs include: Menu, Add, Update, Delete, Browse, Multi-record display-update, Print 24x80, 66x132, any-page report, Message Routing, Screen Refreshing, VSAM alternate index design, setup and handling, Dynamic table manipulation, Audio Tape Initiation and more.

Still, more coding—and more

It's hard to believe the learning can be so easy until you try it. In hours you can start creating Shell mode. In days, you can start writing Pseudo Conversational CICS programs. You'll cut your learning curve at least in half: many programmers report even greater saving. Some CICS techniques are especially hard. When you're stuck for the technical problems, you'll be thankful you have this book. All CICS techniques and problem areas are thoroughly covered. You'll find the topics on Production abend handling, Task system debugging, Dump reading, Trace table usage, CEDF monitor, CSMT, CEMT commands, CICS external tables setup & effects on application programs, Terminal Paging commands, complete procedures to install a CICS transaction and more. Why spend hours searching for the right technique — when this book gives them to you already written.

Tips on moonlighting on CICS projects

Consulting will be the trend of the 80's for CICS due to great shortage of experienced CICS programmers. An average CICS contract programmer makes $30-$45/hr. Some CICS consultants even make $1400/day (9-10 Datamation). Moonlighting on CICS projects is very rewarding. A typical 10-person system can mean $15,000-$25,000 cash. This book contains 11 pages of tips on moonlighting: how to market your service, locate the contracts, write a proposal, make a presentation, quote the right price to beat consulting firms and draw a contract agreement without a lawyer. Written proposal & sample contract agreement are included for your convenience.

Try this book at no risk

How much is this book worth to you? It's hard to say until you try it. That's why we want you to use it for 10 days. If you're not completely satisfied, simply return it at our expense for a prompt full refund. Fair enough? Thousands of copies have been sold. Over 99% of programmers who bought this book are satisfied with it. Say how much time it saves you. How it leads you to the gold mine of programming. That's how sure we are that once you use it, nothing could make you part with it. This book will pay for itself over and over, year after year. But act now. Send $34.95 for 1, $29.95 ea. for 2, $27.95 ea. for 3, $25.95 ea. for 4 & over (plus $2.00 copy for P&H) in check or M.O. to: CCD Online Systems, P.O. Box 797756, Dallas, TX 75379. Allow 1 to 2 weeks for delivery.

Grinnell College Computer Services has an immediate opening for a full time Director of Administrative Computing. Duties include meeting the computing and information needs of the administrative offices. Must understand computer hardware, software systems, information management and office automation. The director will supervise the administrative programming staff and work with a diverse user clientele. Knowledge of DEC VAX or RSTS systems preferable. Knowledge of the FOREE data management system and DEC micro computers helpful. Application deadline: March 23, 1984. Send application letter, resume and names of three references to: Malcolm J. Sherman, Director of Computer Services, Grinnell College, Grinnell, IA 50112-0810. *Grinnell College is an equal opportunity/affirmative action employer and especially seeks women and minority candidates.*

TECHNICAL STAFF (1)
Interactive Computer Graphics Laboratory

Position available for highly experienced APL and Graphics Programmer. Familiarity with APL 2 and some procedural languages desired particularly Fortran and Pascal. Must be proficient in the use of VM/CMS and word processing programs like Script.

This job will involve developing 3-dimensional graphics software system for advanced technology graphics devices. Experience in this area and an interest in the human factors of user-computer interface is highly desired. Much of the development will involve state-of-the-art software concepts and must generally be written in APL 2. A strong mathematics background is recommended and a Bachelor's degree in a related field is required.

PROJECT LEADER
positions now open...with
FORMATION.

Our growth continues in design, sales and support of software systems for manufacturing and other applications—including our own acclaimed MRP II system, **FORMAIR**. This software tool gives the manufacturing manager an on-line system to control inventories and workplace and production costs. This is a new system, developed with the latest technology including Virtual Operating Systems and Database Managers. **FORMAIR** runs on any 370, 43XX, and 30XX-compatible computer, such as our own F4000, a 32-bit minicomputer. *We have immediate openings in the Philadelphia area for:*

Senior Project Leaders

Your ability to display initiative, your strong technical background, and your management skills in scheduling, organizing, problem-solving, and personnel management are needed for project leadership. You will need experience in developing a wide range of applications projects, preferably financial & manufacturing, using interactive Database systems in an IBM 370 systems environment.

These openings are immediate, and offer excellent compensation and benefits plus a results-oriented, totally professional climate. *You'll enjoy the opportunity for contribution and individual development not often found in a major firm.*

If you feel qualified and are interested in arranging a local interview with appropriate management, send your resume, complete with salary history, to: **Vice President of Personnel, FORMATION, 823 East Gate Drive, Mt. Laurel, New Jersey 08054.** An equal opportunity employer M/F.

formation®

FIELD ENGINEERS

Dataserv Computer Maintenance is expanding nationwide. We now have immediate openings in major cities and will be adding more in the near future.

These are key positions and provide excellent opportunities that will lead to further promotion in a fast growing company. Excellent compensation plan and good fringe benefits for experienced individuals. Your potential for personal advancement with a $100 million plus company is the greatest right now as we expand.

We now have an immediate opening in:

Omaha, Nebraska - Customer Service Representative required for a large data center with IBM 3033 Mainframe. Experience on 3420's, 3350's and printers essential.

Dataserv will soon have additional opportunities for field engineers and technical specialists in several other major cities throughout the United States. If you are considering a change in employment, contact Dataserv for a review of what we have to offer.

For immediate consideration and more information call **Toll Free — 800-328-6729** or send your resume to: **Bev Walters, Dataserv Computer Maintenance, Inc., P.O. Box 3003, Hopkins, MN 55343.** We are an equal opportunity employer and all inquiries are considered confidential.

OFFICE AUTOMATION PROFESSIONALS

Technology Planning/Analysis/Design

SOHIO's Cleveland Data Center supports 15 multibusiness users of 50 distributed mini/micro stand-alone computer systems. This includes 30 distributed shared logic systems and 250 computer workstations. To provide our clients with advanced technological products, we need technology planning and analysis/design professionals.

MICRO-COMPUTER SPECIALISTS ■ IBM PC and COMPAQ required ■ HP or DEC helpful ■ Micro-computer communications experience — micro to mainframe required; micro to micro, micro to mini, Local Area Network desirable.

OFFICE AUTOMATION GENERALISTS ■ Integrated Software package experience required ■ Broad mini-computer experience a must ■ Voice store-and-forward, Electronic Mail, and word processing experience helpful.

Major responsibilities:
- Technology tracking and planning
- Hardware/software evaluation of multivendor distributed computing products
- Development and maintenance of products designed to improve productivity and reduce costs

BUSINESS SYSTEMS DESIGNERS/ANALYSTS ■ 3-5 years' combined experience in distributed mainframe and mini/micro technologies ■ Knowledgeable in a wide range of information processing technologies.

Major responsibilities:
- Analysis of user problems/needs
- Design/development of successful business solutions
- Ongoing self development/training to enhance professional expertise

SOHIO offers a highly competitive salary reflecting your individual experience, an excellent benefits package, and a working environment suited to personal and professional growth. **Our comprehensive relocation package for new hires includes all normal moving expenses. Homeowners also qualify for mortgage interest differential allowance, third party home purchase and other features typically restricted to internal transfers.**

Take the first step in joining one of the nation's most successful business entities by sending your resume detailing your education, experience and abilities, in strictest confidence to:

Data Processing Professionals— Come Grow With Westinghouse!

Are you looking for an opportunity that will let you realize your potential career growth? Then it's time you grew with Westinghouse!

The Westinghouse Defense and Electronics Center located near Baltimore Washington International Airport and in Columbia, Maryland are rapidly becoming the most exciting data processing complex in the Mid-Atlantic area. In current use are IBM 3083's, NAS AS/8000's, Univac 1100-84 mainframes, distributed IBM 4341's, HP 3000's and 1000's, VAX 11-780's, DPI 150's, and small business and personal computers. The near future will bring distributed processing, satellite and broadband communications, and distributed data base design.

Westinghouse, the largest private employer in Maryland, has long been a leader in computer technology and is committed to maintaining this position with a multi-billion dollar backlog. We're growing. And so will you when you become a Westinghouse professional!

The following opportunities are available:

Data Base Analysts
At least 4 years data processing experience in an IMS DB-DC environment with a minimum of 2 years experience as a data base analyst is required. Contact Les Caraher at (301) 765-0298.

MVS Systems Programmers
Minimum of 2 years experience with IBM MVS as a systems programmer (preferably with SMP and VSAM) is required. Contact Bill Murray at (301) 765-3208.

Production Control Shift Supervisors
Minimum of 3 years in production control (preferably as a DP shift supervisor responsible for job processing and recovery). Good oral, written, and user-client skills are necessary. Contact Don Miles at (301) 765-6459.

Production Support Analysts
Accomplished in defining, documenting, and enforcing DP production standards as well as control and recovery functions in a large scale Univac or IBM environment. Minimum 3 years DP experience. Contact Don Miles at (301) 765-6459.

U.S. citizenship is required for all positions.

Your knowledge and expertise will be rewarded with an excellent salary and comprehensive benefits package which includes a 100% tuition refund program.

If you qualify for any of the above positions, we want to hear from you! Call the Data Processing supervisor listed above (collect), Monday-Friday, 9am-Noon.

If you are unable to call, send your resume, stating present salary and area of interest to: R.A. Richmond, Westinghouse, Dept. CW312, P.O. Box 1693, Baltimore, Maryland 21203.

An Equal Opportunity Employer.

NIPSSA

We Are Information Systems At The

Naval Intelligence Processing System Support Activity

A major expansion of our capabilities has created opportunities for information systems professionals interested in new and creative systems technologies in the areas of:

- Local Area Networking
- Relational Data Base Administration
- IBM MVS Systems Programming
- DEC VAX/VMS/UNIX Systems Programming
- Configuration Management
- Computer Security
- Distributed Processing
- Software Engineering
- Automated Message Handling

We are currently seeking analysts and programmers. If you have a bachelor's degree with training in the computer field and a solid record of performance in the development and support of these or similar systems, we can offer you a significant and unique opportunity for career enhancement. If you are a recent college graduate with a degree in a computer-related field and a good academic record, we can provide unparalleled opportunities for professional development and education.

Your career at NIPSSA will provide you with hands-on challenges involving IBM MVS, IDMS, VAX/VMS, VAX/UNIX, PDP-11/RSX-11, ORACLE RDBMS, CDC NOS (BE), System 2000 and Zilog Z80 (CP/M) based systems work. Salary range from $17,139 to $48,887.

To begin your challenging new career in intelligence information-processing, please send an SF-171 or resume to the following address:

Naval Intelligence Processing System Support Activity
ATTN: NIPSSA-07 CW
4600 Silver Hill Road, Washington, D.C. 20389

A background investigation for security clearance purposes is a requirement for employment.

An Equal Opportunity Employer • U.S. Citizenship Required

Software Technologists for four surging northeast cities.

Washington, DC Princeton, NJ
New York, NY Philadelphia, PA

Surging is a good word to describe Martin Marietta Data Systems, too. New hardware/software offerings, deeper involvement in total systems integration, plus the exciting recent merger with Mathematica. The result? We have needs. You have opportunities.

SOFTWARE ENGINEERS

Requires 4-5 years' experience programming in BAL in a development environment. Thorough knowledge of IBM operating environments with particular emphasis in VSAM, IBAM, OS, DOS, CICS, BTAM. Communications skills including documenting procedures required. These positions located at Mathematica's Princeton, NJ headquarters or in our Philadelphia area operation.

HP SYSTEM SOFTWARE PROGRAMMERS

Knowledge of HP 3000, model 64/68, 44/48 or 40/42 using MPE. Prior experience in database systems very helpful. Candidate must have at least 3 years' experience with related hardware and operating systems. Positions located at our headquarters in Greenbelt, MD, a suburb of Washington, DC.

IBM SYSTEM SOFTWARE PROGRAMMERS

Knowledge of SSX/VSE or DOS/VSE using VM/CMS. Prior experience using databases (CICS or IDMS) a strong plus. Minimum of 3 years' experience required in a multiple CPU and distributive network environment. Knowledge of Assembler required along with prior program product installation. Positions located at our headquarters in Greenbelt, MD, a suburb of Washington, DC.

PROGRAMMERS

Knowledge of COBOL, IDMS, ADS/O. Background in applications such as: financial, medical and insurance. Positions located at our headquarters in Greenbelt, MD, a suburb of Washington, DC.

IDMS DATA BASE ADMINISTRATORS

Data Base technicians needed for large development project. Requires experience in the Cullinet product line in areas of product installation, internals, performance monitoring and tuning, utilities, design and use of the IDD. Knowledge of ADS/O and CULPRIT helpful. Positions located at our headquarters in Greenbelt, MD, a suburb of Washington, DC.

ADABAS DATA BASE ADMINISTRATORS

Heavy on-line design experience with a minimum of 3 years in the data base administration field. Must have IM ADABAS experience using NATURAL language. CICS would be a strong plus. This will be in the development effort for a long-term project in New York.

For immediate consideration, please call toll free 800-492-6753.
Or, send your resume in confidence to: P. H. Shockley or J.P. Byars, Martin Marietta Data Systems, 6305 Ivy Lane, Dept. PS-14, Greenbelt, Maryland 20770.

MARTIN MARIETTA

An Equal Opportunity Employer Principals Only

Programmers

Pacific Telecom's aggressive diversification into new markets and strong traditional bases of operation in telecommunications have created unusual new opportunities in the **Beautiful Southern Washington Area of the Pacific Northwest.**

Programmer/Analysts
Senior Level

Two opportunities exist for experienced professionals to assist in the development, modification and maintenance of computer applications supporting the Company's information processing needs. Both positions will:

- Research, analyze and document user needs and assist in systems specifications
- Help transfer a designed system into a working product by coding, testing, debugging and documentation
- Participate in the installation and maintenance of a computer application

One position requires minimum 3 years of VAX programming experience to include knowledge of Basic, COBOL and FORTRAN; Datatrieve and FMS, experience desirable, prior experience in engineering related systems preferred.

A second position requires at least 3 years COBOL programming experience; knowledge of SPF/TSO, MVS, JCL and data base essential. IDMS experience desirable; Telephone company billing system experience preferred.

Programmer
Intermediate Level

You will code computer instructions for individual programs, create and modify computer execution control statements and test individual computer programs. To qualify, you must have at least 2 years COBOL programming experience as well as experience on a Honeywell DPS6 or IBM mainframe in an MVS environment. Knowledge of telephone application preferred; thorough understanding of JCL or ECL, IDMS, TSO, SPF desirable. Experience with OCRIS service order processing system preferred.

Our salaries and benefits are outstanding as is our new Corporate Headquarters environment. For consideration, please send resume, with salary history to Isaac Dixon, Personnel Analyst, PACIFIC TELECOM, P.O. Box 9901, Vancouver, WA 98668-9901. No agencies, please. Equal Opportunity Employer.

Performance Analysis Capacity Planning

Move up to the Leader in San Francisco

At Bank of America, our configuration includes 15 3OXX-class CPU's, IMS databases spanning 120 3350's, 1800 spindles of total DASD, and multiple 3705 controllers with hundreds of communications lines and thousands of worldwide terminals.

That's not because our Capacity Planners are unfamiliar with efficiency. It's because Bank of America, one of the world's leading financial institutions, has a tradition of using technology to bring good banking service to our customers, from pioneering the use of Magnetic Ink Character Recognition in the 50's to using PC's for home banking in the 80's.

That's given us a very large computer installation, but we're still on target: efficient, low-cost, innovative, automated banking. To do the planning in the 80's, our Performance/Capacity Consultants have designed some sophisticated workload forecasting techniques, including a "model bank facility".

If you're good at...

—Designing and tuning the resources to support large, complex, high-volume applications

—Balancing business needs with technical strategies

and your background includes...

—an understanding of the internal architecture of IMS, VM, or MVS or

—a penchant for modeling, measurement, statistics in a large-scale computer environment or

—experience using such tools as BEST1, SAS, CAPTURE/MVS, VMAP, SMART, RMF/SMF, on-line monitors and logging software,

then our Capacity Planning/Performance Analysis team would like to know about you. For immediate consideration please send your resume to: Nan Schustus, Sr. Systems Recruiter, Dept. 3228-0312A, Bank of America, Box 37000, San Francisco, CA 94137. We are an equal opportunity employer.

Bank of America

PROGRAMMER ANALYST

City of Greeley, Colorado. Responsible for design, implementation and maintenance of major computer systems. Requires 2-3 years of progressively responsible programming experience, preferrable with UNIVAC 90 or 1100 series. Must have COBOL experience in data base and communications very desirable. Starting salary $1,456-$1,880 per month depending upon qualifications. Apply by March 31 to Personnel-PA, City of Greeley, 919 Seven Street, Greeley, CO 80631. Women, minorities and the disabled encouraged to apply. EOE.

BURROUGHS/BANKING
MCP-DCOM-EFT-ATM

New Project Leader and Programmer positions now open in both Tech Support and EFT areas. We process 300 banks with 2,500 terminals on 34 Medium Systems using CP3600's. Plusses are DCOM, MCP, IPS and Hardware Planning experience OR EFT, Diebold and ATM network experience. Other banking opportunities available. Send resume to:

S. J. Kuebbing
First Financial
Management Corporation
3535 Buford Highway
Atlanta, Georgia 30329

SYSTEM PROGRAMMER I
University of Wisconsin-Parkside

We seek a system programmer to help maintain an IBM 4341 and DEC 11/70 computer systems running VM/SP, DOS/VSE and RSTS/E. Responsibilities include assisting in the generation and maintenance of operating systems, system utilities, and languages.

Candidates should possess 2 or more years of programming experience in PL/I or COBOL. Experience as a system programmer in a CICS environment is desired.

Starting salary ranges from $18,000 to $20,000 depending upon experience and education. Advanced educational opportunities available.

UW-Parkside is a medium-sized university in a pleasant suburban environment, located in southeastern Wisconsin.

Send resume to:
William Wisemann
Director, Computer Center
University of Wisconsin-Parkside
Box No. 2000
Kenosha, WI 53141

AN EQUAL OPPORTUNITY EMPLOYER

TEACH AND TRAVEL

The University of Maryland University College seeks faculty to teach undergraduate computer science and information systems management courses on U.S. military bases in Europe or Asia. Two-month renewable appointments are available beginning August 1984. Candidates should have at least a master's degree in computer science or a related field and recent college teaching experience. U.S. citizenship is required. Benefits include transportation, a currency adjustment allowance and military base privileges (PX, commissary, etc.). Frequent travel and the cost of relocating make these positions difficult for those with children. Send your resume to:
Dr. Lois A. Slater, Overseas Programs, The University of Maryland University College, College Park, MD 20742.

INSTRUCTORS

There's No Time For DOWNTIME!

So while the industry works on your systems problems, let us work on your business problems. Advertise in–

COMPUTERWORLD CLASSIFIEDS!

One insertion will let a potential audience of over a half a million readers know what you are looking for or have to offer. Whether you are looking to recruit computer professionals, want to buy, sell or lease equipment, have computer time or services to offer, or software packages to sell, and more, Computerworld Classifieds will help you get a lot of exposure and get things done faster.

The open line rate is $9.15 per line and there is a minimum size of 1 column by 2" at a cost of $256.20. We can accomodate up to 5 columns and depth measurement increases by half inch increments.

Ads may be mailed in, clearly typewritten, with a letter stating the size desired and the issue in which it is to be run. Our team of ad-takers will take ads that require no artwork or borders over the phone. We also provide telecopier service.

Any borders, logos, or artwork should be sent in with your ad and must be dark and clear enough to be reproduced.

Computerworld comes out every Monday and our deadline for receiving ads is 10 days (or six working days) prior to the issue date desired.

First time advertisers must send payment along with their first ad.

FIRMWARE OPPORTUNITIES...

Spokane, Washington

ISC Systems Corporation, the leader in microprocessor-based terminal systems for the financial industry, is seeking Firmware Professionals to join their expanding Spokane operation.

SENIOR FIRMWARE ENGINEER

We require BSCS, BSEE, or equivalent with at least 5 years direct experience designing firmware, hardware and software. Extensive experience in the development of real-time, multi-function, interrupt-driven firmware with contention timing is also required. Broad knowledge of state-of-the-art hardware and microprocessors is required.

You will be instrumental in designing products produced in high volume and will direct and advise firmware and hardware engineers.

FIRMWARE ENGINEER

We require a BSCS, BSEE, or equivalent with at least 2 years direct experience developing real-time, multi-function, interrupt-driven firmware with contention timing. Disc controller experience preferred.

You will design firmware for products produced in high volume and will interface frequently with hardware and software engineers.

We offer an excellent salary plus generous benefits. Please forward your resume for prompt confidential review to: Bill Baumann,

"A COMPUTER LEASING COMPANY'S FINANCIAL STABILITY IS VITAL."

We said that in 1973, when Randolph became a subsidiary of The First National Bank of Boston . . . and we say it again, because it is still true and even more important today.

As an important part of The First National Bank of Boston, one of the nation's oldest and leading financial institutions, Randolph has a built-in financial stability that continues to be unique in the third-party computer leasing industry.

LEASING COMPUTERS IS OUR ONLY BUSINESS.

Randolph specializes in leases for IBM 3081, 303X and 4300 computer systems and peripherals . . . firm evidence that we plan to perpetuate our computer leasing activity.

Our people have an average of 16 years experience in the DP industry . . . from 360's to 3081's. They know all about alternative financing to be sure, but they also know their way around a DP department and the hardware in it.

WE SPECIALIZE IN SOLVING PROBLEMS.

Machine installed on a rental basis? Long wait for delivery? Stuck with a lease on your old machine? Own a 3081 but need cash? Whatever your problem, we can tailor a lease that will fit your exact needs and let you start saving money right away.

SAVE $80,000 EVERY MONTH FOR THE NEXT 5 YEARS.

You can lease the same 3081 that IBM rents for more than $180,000 per month from Randolph for less than $100,000 per month. If you're renting an older machine, we can save you even more—and you'll get about 4 times the throughput in the bargain.

WHEN IS THE BEST TIME TO TALK TO RANDOLPH?

The sooner the better. But it's never too late, even if you already have a machine installed.

Our 19 years in computer leasing gives added assurance that Randolph will continue as the leader in the computer leasing industry . . . continue to live up to the terms and conditions of our agreements . . . provide upgrades . . . fulfill all of our commitments.

LET RANDOLPH HELP YOU GET THE SYSTEM YOU NEED NOW, *NOW.*

We've already done it for many of the Fortune 500 companies . . . and we can do it for you. Call Joseph B. Kelly, Jr., Executive Vice President, 800-243-5367

Will the real lessor please stand up!

Who do you want to deal with during your computer lease?

An investor? An insurance company? A consortium of banks? Or your leasing company!

As computer experts, we understand your individual equipment requirements. Hartford Computer Group doesn't sell your leased equipment to an investor who will not understand or care about your requirements.

When you sign a lease with Hartford Computer Group, you deal only with us. We maintain complete ownership and control of your leased equipment and can therefore give you the *flexibility* you want in a computer lease. We can do this only by refusing to participate in tax-advantaged leasebacks that give investors control over your leased equipment. Tax-advantaged leases allow for little or no flexibility!

We give you Hartford Computer Group. Want to lease computer equipment? Want to upgrade your computer equipment, renew your lease, or change your leased system completely? With no outside investors or participants to inhibit your transaction, Hartford Computer Group is free to offer the ultimate flexibility in customer service.

You deal with one company, before and after the lease begins, the real lessor...Hartford Computer Group!

Your questions about our unique computer leasing program are answered in our brochure. Write or call for your copy.

No charge to tell the Data General world.

Call us to list the DG equipment you have to sell or buy. There are no fees. CPR's large, computer-based sales force will find you a MATCH TODAY through national phone sweeps, direct mail, and advertising to 500,000 contacts.

Buy at the price you want. Sell at the price you need.

$2 Million is also available to buy and sell your inventory first, with aggressive trade-ins, and leasing through national firms.

Expect the price you want TODAY with CPR:RESALE.

CPR gets you results. California 800-392-2317

800-843-2047

1830 Fourteenth Street, Santa Monica, California 90404 213-450-0910

MISSISSIPPI CENTRAL DATA PROCESSING AUTHORITY

Sealed proposals will be received by the CDPA, 505 Robert E. Lee Building, Jackson, MS 39201 for the following data processing equipment and services:

Request for Proposal No. 912, due 3:30 p.m., Monday, April 2, 1984, for the acquisition of Consulting Services for the Mississippi State Highway Department.

Request for Proposal No. 913, due 3:30 p.m., Thursday, April 5, 1984, for the acquisition of a tape cartridge/streamer for the State of Mississippi Computer Center.

Request for Proposal No. 914, due 3:30 p.m., Friday, March 23, 1984, for the purchase of 5 magnetic tape drive and controller to attach to a Data General Nova CS-80 minicomputer system at the Mississippi Bureau of Narcotics.

Request for Proposal No. 915, due 3:30 p.m., Thursday, March 29, 1984, for the acquisition of a distributed processing minicomputer system with word processing, batch data processing, RJE, TSO, and CICS capabilities for the PEER Committee.

Detailed specifications may be obtained from the CDPA office. The CDPA reserves the right to reject any and all bids and proposals and to waive informalities.

BIDS & PROPOSALS

REQUEST FOR PROPOSAL

New Computer System For The American Society of Civil Engineers New York City

Computer manufacturers, software houses, and/or turnkey vendors are hereby invited to contact the American Society of Civil Engineers to receive a Request for Proposal for a new computer system.

The Request for Proposal may be obtained from Management Information Services, American Society of Civil Engineers, 345 East 47th Street, New York, NY 10017. Phone requests will be accepted at (212) 705-7542.

The Proposal must be received by ASCE at the above address before 5:00 pm on May 7, 1984. The vendor selection is anticipated to be finalized by June 5, 1984.

(203) 566-3004

American Computer Software Manufacturers and Third Party Vendors

The City of Eugene, Oregon is requesting proposals for the acquisition of INTEGRATED SYSTEMS SOFTWARE that includes query language, report writer, application development tools, data base management, data dictionary software. We are preliminarily interested in a system that will allow end users to easily create their own ad-hoc online queries that will provide powerful fourth generation application tools for our programming staff. Proposals will be reviewed by the City of Eugene Purchasing Division until April 16, 1984.

A preproposal conference will be held at 9:00 am PST on Friday, March 23, 1984, at the Regional Information Services classroom, Lane County Public Service Building, 125 East 8th, Eugene, OR. Request for proposals may be obtained from the City of Eugene Purchasing Division, 777 High Street, Room 208, Eugene, OR 97401, (503) 687-5386.

15 pointed questions to ask MSA or any software supplier

These questions will help you when you sit down with individual software companies.

They're tough questions. Relevant ones. And any supplier who is worth his salt should be able to answer them without backpedaling.

Ask MSA

We'll answer all these questions to your satisfaction—plus any others you may have.

In fact, we're probably the best equipped to answer them. Because MSA is the software company. We offer the most complete line of totally integrated systems in the software industry, including financial, human resource and manufacturing.

So you avoid the headache of trying to tie together individual systems. (And the even bigger headache of adding to them.)

With MSA's integrated systems, there's no unnecessary duplication of data or effort. Reporting is faster. All your company's information is more timely and accurate—and in the right form.

Our technical edge comes from experience

Staying ahead is easier for a company that's steeped in software technology. MSA has spent years developing, refining, testing and enhancing our systems.

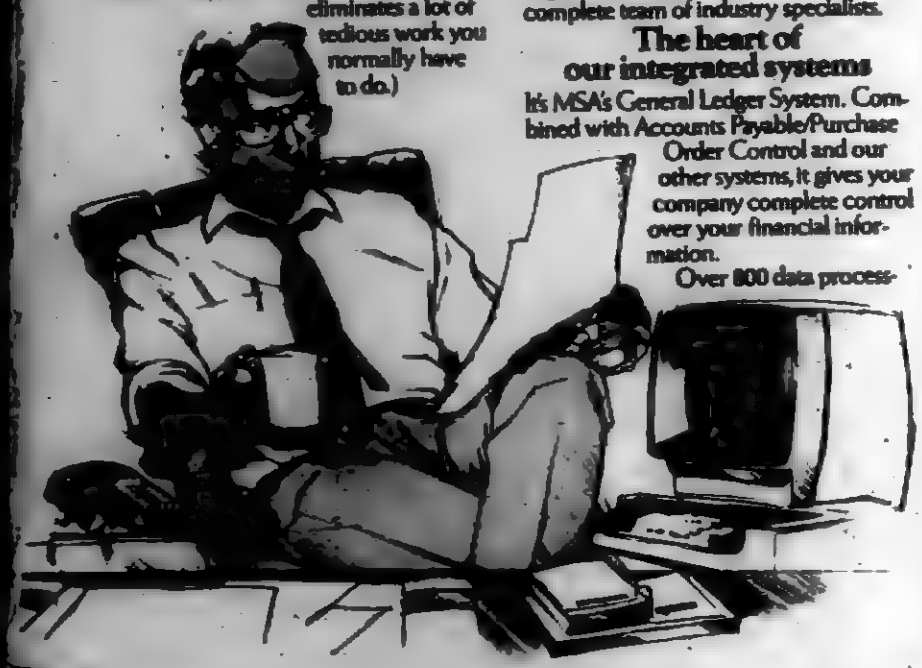
This year alone, we'll invest $25 million to make sure all our systems are technologically razor sharp. That gives us a decided advantage over flash-in-the-pan technology that may not have the bug-free logic of a more experienced system.

It also gives you a decided advantage over "custom" systems you have to update yourself.

MSA relieves you of that time-consuming burden. We update and enhance your software for a full year. Then we continue this service for a surprisingly low annual fee.

Maintenance includes keeping your system up-to-date technologically. Enhancing it with new features that make it work even harder for you.

And making sure it reflects changes in accounting procedures and government regulations, including 401(k), TEFRA, and FAS52. (That eliminates a lot of tedious work you normally have to do.)



Save this box. It can help you make an intelligent software decision.

1. Can you offer us a complete range of software systems designed to work together?
Or will we have to piece together a patchwork of systems?

2. Are your systems just record keepers, or can they really help us make decisions?
Can we pull together information from any of our integrated systems? In exactly the form we want it?

3. Can you provide business software for both mainframe and microcomputers?
Do you develop this software yourself or do you simply market it for another company?

4. Are your systems truly online so all of our information is current?
How many of your systems are online? How secure are they?

5. Will my company have to be the one that discovers the bugs in your brand new system?
Just how long have your systems actually been used, and how have they been tested?

6. Will you update your systems as technology advances and regulations change?
What are some of your most recent updates? Will you keep us current on regulatory changes?

7. Do your systems really do everything you say they will?
Or will we have to change them or add to them to get the features we want?

8. How long have you been in business?
What are your revenues? What is your growth record? Where will your company be five years from now?

9. How many systems has your company installed?
How many of these were installed in the past six months? How many of your earlier customers are still using —and liking—your systems?

10. Do your financial systems handle unlimited foreign currencies?
Do your financial systems use a common set of currency exchange rates?

11. Can you link our executives' computers directly to the mainframe—so they can get their own information?
Is that software available right now?

12. How will you make sure our own people thoroughly understand your system?
Do you have educational centers near us, or will we have to travel all the way across the country to find one? Will you be there to help during installation and after?

13. How many of your people specialize in software for my industry?
How many accountants work for you? Human resource specialists? Manufacturing experts?

14. Do your systems have built-in features that make them easier to use?
What happens if someone needs help figuring out a feature? Do you have online documentation that's easy to understand?

15. As my business changes will your system be flexible enough to change with it?
Or will we have to pay a lot to revamp it? Or even regenerate it?

35,000 days of training

At MSA, we make sure your people have a firm grasp of our systems. Last year alone, we conducted more than 35,000 student days of customer training for over 1,800 companies. At education centers all over the world, as well as at our headquarters.

From training sessions to cassettes to complete, easy-to-understand documentation, MSA provides the most extensive Customer Education Programs in the industry.

And MSA systems are just as friendly as our people. Our online HELP feature actually guides users through our systems, and EASY-SCREEN™ lets them design their own screens without creating data processing nightmares.

If there's ever a question or problem with our systems, MSA customers are always close to service.

Our Account Managers are knowledgeable, responsive, and backed by a complete team of industry specialists.

The heart of our integrated systems

It's MSA's General Ledger System. Combined with Accounts Payable/Purchase Order Control and our other systems, it gives your company complete control over your financial information.

Over 800 data processing specialists, accountants, and financial experts work together to make MSA's financial systems the most advanced and most highly integrated in the industry.

MSA has the answers

Whatever your size—whatever your business—MSA has a total software solution.

We'll provide the highest quality integrated online software.

We'll tie your business and manufacturing software systems together, using our exclusive Extended Closed Loop™ manufacturing system.

We'll provide business software for your microcomputers, through our Peachtree Software Company.

We'll even link your microcomputers to your company's mainframe—with MSA's Executive Peachpak™ application software. A revolutionary concept that lets executives get the mainframe information they need through their personal computers.

MSA ready-to-install application software

...most of it installed.

Whether you're adding only a few more terminals or personal computers, or implementing a more efficient minicomputer access method for hundreds of terminals at a time, you probably don't even have to pull new cables, much less install a complicated new network.

Your in-plant telephone network is already wired into almost every office and potential terminal site in your building. And fortunately, for your data communications needs, its wires can carry voice conversations and data *at the same time*—with a little help.

All you really need is a way to connect a terminal and a telephone to the same set of wires, and that's where MICOM's INSTALINK Voice/Data Multiplexor comes in. A component of MICOM's INSTANET™ Local Network, the "instant" remedy to local area communications headaches—INSTALINK plugs into your existing telephone jack and allows you to use your terminal and your phone independently—without interference of any kind. It supports asynchronous transmissions of up to 19,200 bps, full-duplex, for over a mile—plenty for almost any local networking application.

And it provides something else that many other in-house networks don't or can't: complete portability. A terminal can be moved to a new site and connected to any telephone line already in place. No rerouting of cables. No complicated interfacing. Just plug it in.

Best of all, INSTALINK provides all this without requiring any long-term commitment, without major investment, without disrupting normal business operations, and without fuss—*instantly*.

Call or send for a brochure which explains how.

You don't have to buy new terminals; you already own them.

Your IBM 3278 is a multi-function performer. Talk to DEC hosts, including those running the Unix and VAX/VMS operating systems. Talk to Dow Jones™ News/Retrieval Service for the latest stock information. Dial-up The Source. Connect to your Local Area Networks. The PCI 74D makes previously inaccessible time-sharing and private ASCII networks instantly available.

talking to IBM.

The PCI 74D switches your IBM 3278 terminal into the ASCII mode when it receives a specific keyboard command sequence. Suddenly the asynch ASCII world is at your fingertips. And just as easily, with another stroke of the key, you're back to IBM.

The PCI 74D resides between the IBM controllers (3274s and 3276s) and the hosts (IBM and ASCII). Connections to the con-

is transparent to the IBM host.

Full capabilities. both worlds.

When your 3278 is in the ASCII mode, it can be a DEC VT-100 or TTY-compatible terminal. When your 3278 switches back to IBM, it regains its IBM screen capabilities, its 3278 identity. It's a split personality terminal, with the PCI 74D.

If you'd like to hear more about how to make your IBM world non-IBM compatible, get a dialog going with PCI today.

To start your conversation, write "Hello DEC, this is IBM calling" on your business card, and send it to Protocol Computers, Inc., 6150 Canoga Avenue, Woodland Hills, CA 91367-3773, or call (800) 423-5904. In California, call (818) 716-5500.

EDITORIAL

Vanishing Videotex?

The cavalcade of new and innovative communications technology is impressive and seemingly never-ending. In the past few years, we have witnessed the introduction of local-area networks, satellite networks, digital private branch exchanges (PBX) and a host of other ground-breaking technologies.

There is a tendency to assume they are all smashing successes. However, in the case of videotex, we wonder. Videotex uses telephone lines and CRT screens to send and receive data and graphics. Its technological cousin, teletext, is a receive-only service that broadcasts over the airwaves.

Videotex has been around in its current form for a few years now. It has been the subject of international attention through many articles in both the trade and general press. The French government has been one of the most notable videotex boosters, implementing a test network around Paris as part of its nationwide *Informatique* computerization program. The French planned to give videotex terminals to all users free of charge with the expectation of making up for the losses by selling the terminals in this country. U.S. sales have not been impressive.

Here, videotex has barely gotten off the ground. Only one commercial venture is currently in operation. It is run in southern Florida by Knight-Ridder Newspapers, Inc. and AT&T. Another that is being offered by Times Mirror, Inc. is scheduled to start this July in Orange County, Calif.

Recently, IBM, CBS, Inc. and Sears, Roebuck & Co. gave the lagging technology a publicity shot in the arm by announcing a joint videotex venture *that won't begin for several years*. The politics of this are more interesting than the service itself. It looks like IBM vs. AT&T.

Over the past two years, CBS tested a videotex service with AT&T in Ridgewood, N.J., called Venture One. CBS is said to have broken off the relationship with AT&T because IBM plans to offer its service to residences with personal computers, while AT&T made Venture One available only over $600 terminals that could not be used for anything else. CBS reportedly dumped $10 million into Venture One. The key here is personal computers, or more appropriately, home computers, since the IBM-CBS-Sears service is destined for homes as opposed to businesses.

For many years, industry pundits predicted the widespread proliferation of home computers. It just hasn't happened. Ask Texas Instruments, Inc., which cancelled its home computer. Prices have been too high and applications too few.

People are slow to change their culture and habits. Bringing a computer into their homes represents a radical change, and they won't make such a change without very compelling reasons. So what if they can do shopping from home? Most people would rather go out to shop, given the choice.

The time may come when computers or some kinds of terminals are commonplace in the home. But that is not going to happen for at least another 10 years, when integrated services digital networks become universally accessible.

In the meantime, unless videotex technology can be popularized outside the home market, it will remain on the outside looking in.

Announcing . . .

I am proud to announce that *Computerworld On Communications* is increasing its frequency of publication from six to 12 times a year, effective with our June issue.

The events of 1984 have underscored the need for more information on the communications industry. The breakup of AT&T and the formation of a virtually new industry has placed an unprecedented burden on the shoulders of computer and communications professionals. There are new opportunities and new problems. There is new technology.

By going monthly, we intend to bring the changing communications picture into sharper focus for you. We will be adding a news analysis section and our departments and features will become twice as timely. It all adds up to more comprehensive coverage of the most dynamic industry in the world.

We look forward to sharing that coverage with you.

PRO & CON

Clamping the Cuffs on Centrex?

The furor over the Federal Communications Commission's (FCC) proposed access charges for Centrex users has galvanized the interest of two sharply divided groups. The first group is comprised of the Bell operating companies that offer Centrex, a central office-based competitor to private branch exchanges (PBX). The second group is the North American Telecommunications Association (Nata), which represents PBX and other equipment manufacturers.

Last July 27, the FCC proposed that a $2 maximum access charge be levied on each Centrex line purchased before that date and a $6 maximum charge be placed on lines acquired after it. The FCC reaffirmed its commitment to that scheme in early February.

Nata sees that policy as a bailout for Centrex, while the operating companies feel it will give PBX users an unfair advantage and drive the operating companies into financial ruin.

In this month's "Pro and Con," we present the opinions of both sides.

PRO

By Edwin B. Spievack

While the questions surrounding the determination of equitable access charges for Centrex users appear complex, the central issue is quite simple. Should access charges for large corporate and institutional users of Centrex service — which competes directly with private branch exchange (PBX) products offered by competitive equipment suppliers — be subsidized at the expense of all non-Centrex ratepayers, competitive PBX and Key system suppliers and continued technological innovation?

The thrust of the Federal Communications Commission's (FCC) initial access charge decision, announced in December 1982, was reasonable: "Users of the local telephone network should be responsible for the costs they actually cause." Essentially, charges were divided into two categories: traffic-sensitive costs, whereby customers would pay according to their actual use of the network, as they do now; and nontraffic-sensitive costs, whereby all users — business and residential — would pay flat rates to recover the basic costs of maintaining the wire or trunk line between the customer's premises and the central office switch. The nontraffic-sensitive rates have stimulated the controversy between Centrex and PBX users and suppliers, not to mention the related outcry by residential customers.

Phase 1 of the protectionism campaign culminated in July 1983, when the FCC proposed a major bailout to the Bell operating companies. Their existing or "grandfathered" Centrex users would pay only $2 per month in nontraffic-sensitive trunk line charges, compared with $6 per month for all other multiline users, including customers who signed up for Centrex after July 27, 1984. Incredibly, the cut-rate treatment for Centrex users — big business, big government and large institutions — was the same afforded residential customers. The decision — on its face, arbitrary and capricious — has been appealed to the courts by the North American Telecommunications Association (Nata).

Predictably, however, the Bell operating companies said the generous July Centrex bailout provided insufficient protection. A hypothetical example illustrates why. Let's say a PBX user has 100 telephones in his office. Because so much of his traffic is handled internally by the on-premises PBX switch, he might need only 10 truck line connections to the central office. At $6 per line, his monthly access charge payments would be $60.

A similar office with 100 telephones, but with Centrex, would require 100 trunk connections.

(Continued on Page 5)

Spievack is president and executive director of Nata, Washington D.C.

CON

By Jim Epperson

Unnecessary expenses. Fewer choices. More uncertainty in the telecommunications industry. Higher local rates.

These and other hardships could become reality if the Federal Communications Commission (FCC) does not permit fair pricing policies for Centrex-CO services. The issue at hand is the discrepancy between how access charges will apply to private branch exchange (PBX) systems and Centrex-CO lines.

Southwestern Bell Telephone Co., other Bell operating companies and many business organizations believe that the FCC could provide an equitable solution by applying the same set of pricing rules to both PBX and Centrex service. A closer examination reveals that much is at stake.

Under the current FCC plan, the Centrex customer would pay far more than a customer served by a comparable PBX — even though the systems provide equivalent service. Here is an example, comparing a Centrex system serving 1,000 stations with a PBX of the same size. The Centrex system would have 1,000 loops or lines connecting the customer's business to the telephone switching office. The PBX would typically have 89 trunks for exchange access. An existing Centrex customer would pay $24,000 annually in interstate access charges. The PBX customer would pay about $6,400 — again for comparable service. A new Centrex customer, defined by the FCC as one who ordered the service after July 27, 1983, would be charged $72,000 based on the commission's current order.

There would be an unfortunate result of this discriminatory policy. Many current Centrex customers would be forced to incur the unnecessary expense of changing their telecommunications system, not because Centrex no longer meets their needs, but because they could not afford higher rates imposed by the FCC.

As existing Centrex customers abandon the service, Southwestern Bell would be burdened with a substantial amount of idled plant for some time. Even though the plant would not be used, and therefore would not be producing revenue, it would remain an earnings requirement to be borne by the general body of ratepayers.

As a result, other customers would be forced to shoulder this unnecessary expense — estimated to be about $9 per year for remaining access lines.

Because the higher business end-user access charge would apply to all new Centrex systems, it is likely that potential customers would find the service economically unfeasible. This is unfortunate, because existing outside plant and central office capability — which could have been used by new Centrex customers — would instead become an additional burden to ratepayers.

The FCC's approach would effectively reduce the number of options available to customers, as well as add yet another element of uncertainty to the telecommunications industry.

What is the solution? Centrex customers should pay end-user access charges commensurate with PBX customers of comparable size. This could be accomplished by applying a PBX trunk equivalency ratio. To determine the appropriate ratio, existing or proposed Centrex systems could be examined to see how many trunks would be required if the customer were served by a PBX based on industry trunk equivalency studies. Access charges would be applied accordingly.

Some parties have wrongfully argued that end-user access charges should be applied to all Centrex lines because, like regular business and residential lines, they are connected directly to the telephone switching office. But there is a substantial difference.

(Continued on Page 5)

Epperson is staff manager, corporate news, Southwestern Bell, St. Louis, Mo.

PRO

(Continued from Page 4)

Even at the bargain-basement rate of $2 per line, the Centrex user's monthly payments would be $200. What the Bell operating companies want is the total elimination of Centrex access charges or a skewed parity formula that gives Centrex service a preferential pricing advantage over competitive equipment suppliers.

Thus, Phase 2 of the Centrex bailout was launched, and it incorporated three equally spurious arguments. First, the Bell operating companies, accompanied by Fortune 500 corporations still using Centrex, introduced the concept of PBX trunking equivalencies. Stripped of its "scientific" veneer, the concept is simple: If our hypothetical PBX user with 100 telephones and 10 trunk lines pays $60 a month in access charges, then our hypothetical Centrex user with 100 telephones should also pay $60, despite the reality that he requires 10 times as many lines.

Second, the Bell operating companies argued that because Centrex customers often use their lines for nonbasic exchange calls, they should be assessed less. Their argument conveniently evades the basic point of the FCC decision: access charges to cover the nontraffic-sensitive costs of network maintenance have nothing to do with how or how often the lines are used.

Finally, the Bell operating companies, with some support of state regulators, have raised the threat that without further protection, users will continue to abandon Centrex and saddle the telephone companies with stranded investment in central office plant. The claim is untrue. Testimony from telephone company executives in several state proceedings indicates that the utilities could reuse all but 10% to 30% of their outside wires and probably all central office equipment now devoted to Centrex for the provision of basic local exchange service.

Who will suffer from a Centrex bailout?

■ *All PBX and Key system users.* They will be discriminated against by having to pay higher access charges.

■ *All PBX and Key system suppliers.* They will be forced to compete against the Bell operating companies' underpriced, subsidized Centrex service.

■ *All residential and business ratepayers.* They will be forced to make up the shortfall in Centrex access charges through higher long-distance bills. Someone must pay for the network.

■ *Technological innovation.* PBX technology was developed to satisfy market needs not met by Centrex, its predecessor. A bailout of Centrex rewards outmoded, inefficient technology and penalizes modern, more efficient alternatives.

■ *Competitive policy.* A Centrex bailout contradicts the thrust of the FCC's deregulation policy, the AT&T antitrust settlement and recent legislative proposals.

Compared with the multitude of losers, there are only two beneficiaries of a Centrex bailout: a small class of corporate and institutional users and the Bell operating companies. The choice is clear: protectionism or the public interest? ■

CON

(Continued from Page 4)

Business and residential access lines are used exclusively to access the local and long-distance networks.

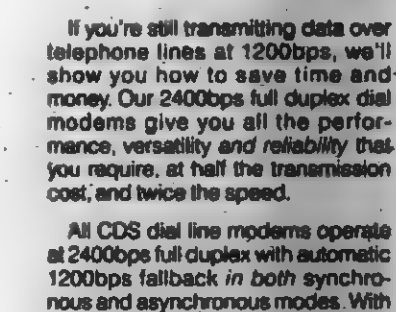
On the other hand, a considerable amount of traffic on Centrex systems never reaches the public network — instead it stays in the system in the form of intercom calls. The bottom line is that Centrex and PBX systems provide equivalent exchange service. In fairness, then, equivalent pricing rules should apply.

Southwestern Bell has formally asked the FCC to reconsider its position regarding the imposition of access charges on Centrex-CO lines and to adopt the PBX equivalency ratio. The FCC's most recent decision reaffirms its earlier position. There is no doubt that reaffirmation will have a substantial impact on Centrex users, Southwestern Bell and, equally important, all the company's customers. It is crucial that the FCC modify its ruling so all customers will be treated fairly. ■

WE HAVE 2400 GOOD WAYS TO UPGRADE YOUR DIAL LINE DATA COMMUNICATIONS

If you're still transmitting data over telephone lines at 1200bps, we'll show you how to save time and money. Our 2400bps full duplex dial modems give you all the performance, versatility *and reliability* that you require, at half the transmission cost, and twice the speed.

All CDS dial line modems operate at 2400bps full duplex with automatic 1200bps fallback *in both* synchronous and asynchronous modes. With our modems you can communicate from or to any terminal, micro, mini, or mainframe computer (even your PC), with support of BSC, HDLC, SDLC, X.25 or *any other* full or half duplex protocol.



Double your data rate and cut transmission costs with complete reliability.

And with CDS 2400bps full duplex dial modems, you won't have to sacrifice one bit of data integrity. Our modems all use advanced signal processing techniques, and feature automatic adaptive equalization. Sophisticated modem diagnostics including analog and digital self-test and an internal test pattern generator rapidly isolate modem faults. With a CDS 2400bps modem, your data will come through smoothly and accurately, even on poor telephone lines.

Communicate with mainframes, minis or micros using any sync or async protocol.

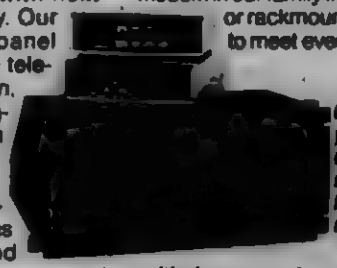
CDS modems combine user-friendly engineering with next-generation technology. Our touch sensitive front panel allows you to select the telephone line configuration, operating mode and diagnostic tests you need. An optional front panel synch/asynch selector lets you switch from synchronous to asynchronous transmission swiftly and easily, without monkeying around with internal modem straps.

Our new 2400bps autodial modem eliminates extra telephone hardware and lets you leave your modem unattended...ready to communicate when telephone rates are lowest. It supports both touch-tone and rotary dialing systems and operates with "dumb" or intelligent terminals using keyboard or software controlled commands.

Send data at all-hour rates with 2400bps modems!

We've built our reputation on products that give you advanced engineering at down to earth prices. Our 2400bps full duplex modems range from $995 to $1195 with attractive quantity discounts available.

There's a 2400bps full duplex dial modem in our family in either tabletop or rackmount configuration to meet every need.



Get the features you want in the configuration you need from our full family of 2400bps modems.

It's time you got more data for your dollar. Call or write, Concord Data Systems, 303 Bear Hill Road, Waltham, Massachusetts 02154 (617) 890-1394, or contact the CDS representative nearest you.

DIALOGUE

Do you foresee a conflict between communications and DP managers?

Howard Frank, president, Contel Information Systems, Inc., Great Neck, N.Y.:

"I see more than just a conflict. I see a battle that I believe will be won by the DP people and will end up absorbing the communications functions as part of DP.

"The reason is based on two indisputable facts. Look at the DP organization today, and you see a much larger staff than the corresponding communications organization. Second, examine the level of reporting as compared to communications, and you will find the head of the DP organization reports in at a much higher level. He may be a vice-president or he may be a director, but he is always at a higher level of the corporate hierarchy than his communications counterpart.

"In the '70s, communications was an uncontrollable cost expense that required little management. Correspondingly, the communications manager was an order-taker who worked between the end user in the organization and the telephone company. As such, he did not need to be so high up in the organization. The reality has profligated itself. Communications has grown in stature, but not to the level of the DP department, which grew up as long ago as the '60s."

Former telecommunications manager, currently telephone systems manager of a supermarket chain:

"I've been in communications for 25 years. We veterans feel we have been doing telecommunications for so long that we know our way is the best way.

"I even dropped out of the [Telecommunications Association] because I felt I was getting very little value out of it. You see, in many companies, the people in the communications area are pretty new in the industry. They were just seeking information from TCA. So we decided it wasn't worth our time to participate.

"There is a definite split between data communications and voice communications. There are different networks for the two types of systems. Eventually, it will have to be brought under one person, one head. [Private branch exchanges] exist, and they handle both data and voice. We are going in the wrong direction. The two jobs should be merged, not split.

"As I see it, DP people want to get more involved in communications, because it is the new frontier, just as DP was years back. There will definitely be a conflict. DP people might be trying to take over communications or responsibility for a larger portion of it. It is a trend I'm aware of. Actually, it is a trend I have seen. It has changed, but not for the better."

Shaun Delany, telecommunications and planning analyst, H.J. Heinz Co., Pittsburgh, Pa.:

"When I came here six years ago, communications was an add-on to office services. Now it has been folded into the communications systems department. It has tremendous visibility and responsibility now.

"Telecommunications is getting so much publicity, and its value has been heightened so much in the past 10 or 15 years — the way you deal with the telephone company and the skills needed are so much more. It's the thing to get into. It is corporate visibility.

"All I can say is communications people have not effectively sold upper management on the importance of communications. The telecommunications person who loses and finds himself in effect reporting to data processing has not done an effective job of communicating what he is doing.

"I do not see any conflicts in my environment in particular. I think those conflicts existed in the past. It depends on the company and who the communications people report to. It is clear that computers and communications are merging. The PBX Heinz just put in is a microprocessor.

"At Heinz, both computing and communications report to the same general manager. I work full-time on communications planning and activities, and another fellow works more on day-to-day operatons. I work with DP people when necessary.

Larry Abearn, manager of technical services at Harper & Row Publishers, Inc., New York:

"That is tough for me to answer because at our company, the DP people are the communications people.

"I don't see any real conflict because we separate communications into voice and data. Data communications is handled mostly by data processing people here. The people on the voice side are

SAVE MONEY ON TALK FASTER.

THE CODEX 224 DIAL MODEM.

responsible for the telephone system, taking care of the economics of it and so on. I don't see it as a conflict. There might be a conflict for companies where data communications was separate from data processing, but not at this company.

"In my department, technical services, we handle the data communications side of things, such as modems. We are the ones who take care of line problems and response time problems. We are involved with hooking up personal computers to the host and installing protocol conversions.

"We do not have anything to do with the telephone system itself. We are a multilocation company, and we have various PBX systems installed in different places.

"Data processing never had anything to do with the PBX, until recently. Now, they are being asked to start to study those things and learn more about them and see how they tie together. What we've been doing with voice and data communications is somehow going to merge. The PBXs are so capable of handling data transmission that we see ourselves getting involved in that area. There are no definite plans to merge, but it will happen."

Francis X. Daubeck, president, Communications Network Architects, Inc., Washington, D.C.:

"In most major organizations, there will not be a conflict because communications and data processing people are coexisting in the same functions and, in all probability, they report to a common managerial function.

"There is a major conflict occurring in organizations where this does not occur, and those organizations are going through the throes of that conflict. The impetus is the co-mingling of voice and data.

"In large corporations that are forward-thinking, they are integrating the responsibility functions of voice and data."

John Malone, president, Eastern Management Group, Parsippany, N.J.:

"If you had asked me that question 18 months ago, I would have said that I see a very real conflict establishing itself between the communications manager and the DP manager, as each jockeyed for control of the [management information systems] function within the companies they worked for.

"But what we have found over the last 18 months in the research we do is that both groups understand that as the technologies they are responsible for converge, there is a definite requirement for individuals who clearly understand their own discipline, yet have an appreciation for their counterparts.

"Therefore, as I look at the next five years, I do not feel the relationship between the communications manager and DP managers will be adversary, nor that either of these parties view the future of the relationship as being threatening.

"I think the way they tend to view it is that voice, image, text and data will converge. However, there will clearly be a requirement for the expertise of data communications managers to address some of these specific piece parts such as the requirement for the communications manager to understand the role of the PBX switch and how it fits into the role of the entire communications environment."

LETTERS

Hysterical Harry

The article was fantastic.
Best wishes.

Harry Newton
Publisher
Teleconnect
New York, N.Y.

Congratulations on the January issue of *Computerworld On Communications*. You certainly are getting an excellent variety in coverage and depth of the articles.

Harry Newton's picture on the cover led me to conclude you had sold him the inside page to advertise *Teleconnect*, but then I understood: Harry had sold you. He certainly brings an almost irreverent view to the industry, but never irrelevant. His knack of reinforcing the role and sophistication of the end user is a great contribution to the emerging infrastructure of the business.

Desmond F. Hudson
President
Northern Telecom, Inc.
Nashville, Tenn.

Please send information about how I can contact Harry Newton and his Telecom Library. You article has really aroused my interest.

YOUR PHONE BILL.

If you're running 212 modems in a dial-up network, Codex has a new product that can significantly reduce your phone bills.

It's the Codex 224 modem.

At 1200 bits per second, the Codex 224 is fully compatible with Bell's 212 modem. But because the Codex 224 also runs at 2400 bits per second you can transfer more data faster and therein lies the economy.

You can run at 2400 bps full duplex asynchronous or synchronous over public telephone lines, even unattended. And because the Codex 224 incorporates advanced equalizers you're assured of high performance at higher speeds even over marginal lines. In addition, the Codex 224 automatically recognizes 1200 or 2400 bps transmissions and adjusts automatically.

And with faster file transfer and screen fills, people in the network will be able to get more done in the same time.

What all this means is that you can get better productivity and significant savings in your 212 network simply by installing Codex 224 modems.

The Codex 224, which meets the CCITT international standard, can be leased directly from Codex or purchased outright.

In short, you don't have to make a massive investment to run a better, faster, more economical network.

All you have to do is call Codex.

Call 1-800-821-7700 Ext. 895. Or write: Codex Corporation, Dept. 707-95, 20 Cabot Blvd., Mansfield, MA 02048.

Fill in your IBM micro/mainframe communications picture.

AST Research, the leader in IBM PC enhancement products, brightens your micro/mainframe communications picture with a full palette of economical, integrated hardware/software masterpieces. With AST Products, you can emulate IBM terminals or create PC-based Local Area Networks.

AST improves your office operating cost picture.

AST communications products give your IBM PC the flexibility to act as a terminal for your host system or as a stand-alone computer for smaller tasks. Your PC won't bog down the mainframe with unnecessary small jobs and local computing on the PC eliminates phone line charges too. Get the power of a mainframe when you need it and personal computer convenience right at your fingertips.

Applications solutions that are strokes of genius.

AST keeps pace with your ever-changing applications requirements with reliable, high quality, cost effective communications products. AST products provide support for Bisync and SNA/SDLC communications protocols as well as networking multiple PCs for sharing resources.

Choose AST products — by the numbers.

These AST communications packages are currently available:

1. **AST-SNA™** emulates a 3274/3276 controller and 3278 or 3279 display terminal using SDLC protocol.
2. **AST-BSC™** emulates 2770 batch RJE and remote 3270 display terminals using 3270 Bisync protocol.
3. **AST-PCOX™** allows your PC to connect to an IBM 3274/3276 cluster controller via coax cable and emulates a 3278 or 3279 display terminal.
4. **AST-3780™** emulates 2770, 2780, 3741, and 3780 RJE workstations using Bisync protocol.
5. **AST-5251™** emulates a 5251 Model 12 remote workstation connected to an IBM System 34, 36 or 38.
6. **PCnet™** is the first Local Area Network designed specifically for the IBM PC or XT and the PC-DOS 1.1 or 2.0 operating system.
7. **CC-232™** is a user-programmable dual-port card capable of communicating in Async, Bisync, SDLC or HDLC protocols.

Discover how well AST can fill in your micro/mainframe communications picture. For descriptive data sheets, write or call: AST Research Inc., 2121 Alton Ave., Irvine, CA 92714. (714) 863-1333. TWX: 295370ASTRUR

KATHERINE HAFNER

Rolm Wasn't Bought in a Day

The courtship between **IBM** and **Rolm Corp.**, heading for full bloom, is providing much fodder for the troughs of industry speculators and journalists alike. Ever since Big Blue's unconsummated connection with Mitel Corp., the whole world has been watching the IBM-Rolm liaison with bated breath. IBM's share in Rolm was 20% at press time, up 5% since the initial acquisition last June. And IBM watchers fully expect IBM to buy the maximum 30% allowable by the end of 1984.

As a leading manufacturer of private branch exchanges (PBX) in Europe since 1971, IBM has been considering a move into the U.S. PBX market for the past decade. Its brief encounter with Mitel ended when Mitel could not deliver its software on time. So IBM cast about for another relationship and anchored itself with Rolm. Now that IBM is pretty well ensconced in its new relationship, everyone is buzzing with conjecture about the course the two plan to take.

"In broad terms, IBM plans to integrate Rolm into its [office automation] plans," said Kenneth Bosomworth, president of International Resource Development, Inc. "At a strategic level, IBM's interest is to have a particular version of a PBX around which it can construct network elements of OA strategies."

Translated into actual products, IBM's local-area net offering and micro-to-mainframe communications will integrate Rolm switches, Bosomworth speculated.

In order to maintain account control, one IBM pundit said, Big Blue has no choice but to include a switch in its offerings. "Technology is forcing IBM to do things it probably hadn't planned to do," said William A. Morgan of TelePC Consulting. Morgan sees the coexistence of broadband networks and PBXs as the optimum networking solution for the future.

Depending on whom you listen to, IBM is either in this for the switch or for the research and development expertise available at Rolm. "I think IBM's involvement is primarily for market research rather than for something it is planning to market," Phil Reagan, a California consultant, suggested. "IBM does say it's an investment. What they don't say is that it is an investment in research and development."

IBM, of course, offers little light to shed on the matter. "As a practice, we don't really discuss plans," said one IBM spokesman.

On Communications staff writer Hafner collects tidbits of communications news for "At Large." She welcomes suggestions.

"It's not a cut and dry situation," said a second.

And the following was offered by a third corporate communications specialist: "We intend to negotiate specific agreements providing for cooperative development efforts and possible joint ventures outside the U.S."

AT&T Information System's long-awaited **Net 1000** service has confounded the communications community to the point where speculation is something of a joke. The value-added net is described by AT&T Information Systems public relations people as a "shared, distributed, customer-programmable intelligent data communications network alternative" to such plain-vanillas as GTE Telenet and Tymnet, Inc.

But industry analysts and beta testers appear to be decidedly unimpressed by what they have seen to date. "Net 1000 seems to be pretty much plain vanilla, too," Alysa Subtelny, a market analyst at The Yankee Group, said. "Or if it's got sprinkles, they're the same sprinkles everyone else has."

Net 1000 has already died many deaths since its first incarnation in 1975 as Bell Data Network, which was scrapped and then replaced in 1978 by Advanced Communication Service — nicknamed "Almost Communication Service" by some of its early detractors. In 1981, AT&T scuttled the system yet again, and when American Bell, Inc. was formed in June 1982, the network resurfaced as Net 1. The name Net 1 was shortlived, as Ungermann-Bass, Inc. had already claimed that for its local-area network. Thus, Net 1000 was born.

Net 1000's identity crises have been compounded by the suspicion among analysts that the product is having difficulty finding a comfortable user niche among its two dozen beta testers.

Gary Schultz of Northwest Industries in Chicago, which tested Net 1000 for two months last spring, seemed to confirm that suspicion. "Our needs for the network were limited," he said. "We wanted strictly data transport services. American Bell kept saying, 'We're not in the transport business.' In fact, they said that so often the words still ring in my ears. But when you logged on to the network, it was clear you were logging on to a time-sharing system. When you got your bill, you knew you were billed according to how much processing time you used."

Schultz branded the network "a bit of an overkill." He explained, "We wanted a simple method for communicating and transporting data. The price was higher than what we wanted to pay.

"Net 1000 certainly has potential," he said. "But the direction they were going with it seemed to be at a 45-degree angle."

Undeniably, progress has been made. Net 1000 was demonstrated live for the first time at the recent Communications Networks exposition in Washington, D.C. At the same time, AT&T Information Systems announced a third-party software agreement with AGS Computers, Inc., whereby the Mountainside, N.J. company will develop customized software for users to "sign up electronically" for the Dow Jones & Co., Inc.'s News/Retrieval via Net 1000.

In 1981, the FCC gave AT&T approval to spend up to $500 million developing Net 1000. According to Allen Rehert, director of Net 1000 product support at AT&T Information Systems, while capital spending on the network to date is well below that ceiling, Net 1000 will still "take some time to implement." With phased implementation, Rehert said, the system will be up and running by the third quarter of 1984.

If AT&T Information Systems is going to gain an edge on the marketplace, that edge will be obtained by dint of AT&T's reputation for reliable service and technical support. "We were immensely pleased with the support we got," Schultz pointed out. "Their technical support is the best we've had in a long time."

Subtelny echoed these sentiments. "From the feedback we've gotten, even from the test sites that felt Net 1000 wasn't right for them, people across the board were very pleased with the support they got from AT&T. It was like in the good old days with IBM, when IBM camped out with your system if anything went wrong."

Other field testers for the network are Transamerica Corp., Roadway Express, Inc. and Ford Motor Co. Transamerica has reportedly had extensive problems with the product: "The issue there was one of deployment," Rehert insisted. Ford's beta test began in February, so a full evaluation of the system is yet to be made.

According to Robert Everhart, Ford's project manager for data communications planning, Net 1000 will be used for an experimental "parts locater" system, whereby a dealer can inquire about the status of another dealer's inventory.

Ford was seriously considering Tymnet for the same inquiry system, but decided on AT&T Information Systems. "We wanted to give them an opportunity to see what they could do with this," Everhart said.

Ford's 90-day agreement with AT&T Information Systems is just for the pilot test, for which AT&T Information Systems is developing the software to run on the network. At the end of the 90 days, Ford will decide whether to expand the system nationwide or discontinue it entirely.

At this early stage, Everhart said he is pleased with the support he has seen from AT&T Information Systems. "But the proof of the pudding will be when the test gets under way, and we see how well it works," he added. ■

ALAN PEARCE

When Weaning Turns to Warring

A traditional and historical alliance will come to a crashing and competitive end this year.

For over a hundred years, AT&T and the Bell operating companies have worked together to give the nation rapid, efficient and low-cost telephone service. They have never competed head to head. Even when U.S. Federal District Court Judge Harold Greene approved the divestiture of the Bell operating companies in settling the antitrust case, there were few who saw that the breakup of the company would result in inevitable competition among its parts.

But it is now becoming clear that the divested Bell operating companies are ready to enter the inter-Local Access and Transport Area (Lata) toll market, while AT&T is preparing to become the major local telephone bypasser. In addition, the two former allies are already competing in the customer premises equipment field — a rivalry that will become more intense as the year progresses. Finally, both AT&T and the operating companies want to amend the Federal Communications Commission's (FCC) 1980 Computer II decision.

CHARLES ROSENBLATT

It is perhaps ironic that the biggest threat to the future of AT&T's competitive prospects in the long-distance telephone market is from its newly divested operating companies. The regional holding companies are determined to set aside the business restrictions that prevent them from competing with their former parent in long-distance telecommunications — the inter-Lata market.

Under the terms of the Modified Final Judgment, which settled the antitrust case, the local operating and regional holding companies can provide only exchange access and local service functions.

They may not provide any other service that "is not a natural monopoly service actually regulated by tariff," according to the Modified Final Judgment.

If these restrictions were set aside this year or next, the Bell operating companies would be able to compete much more effectively with AT&T Communications and carriers such as MCI Communications Corp., GTE Sprint, Western Union, Satellite Business Systems and others. Indeed, the fact that GTE was given permission to take over Sprint gave rise to the Bell operating companies' expectations and intentions regarding their reentry into the toll market.

A regional operating company such as Ameritech, which combines the midwestern Bell operating companies, might want to buy a regional toll carrier and reseller, for example Lexitel. Lexitel would be an ideal purchase for Ameritech, and it may be that the regional carrier, based in Detroit, will need some capital, which Ameritech could provide, in order to expand its network.

The Bell operating companies may benefit from growing sympathy coming from Capitol Hill. Judge Greene is known to pay close attention to Congress, and any heavy political support for the Bell operating companies reentering the toll market might influence him. Clearly, if Ameritech purchased Lexitel, Lexitel would have to operate as a separate subsidiary, just like Sprint operates as a separate subsidiary in the GTE corporate structure.

Thus, we see a situation in which other telephone operating companies such as GTE can become toll carriers, while the divested Bell operating companies cannot. This, it will be argued, is unfair. The state regulatory commissions appear to be allies for the Bell operating companies' entry into inter-Lata toll, especially if there is a belief that their reentry into the toll market would help keep local rates down.

For its part, AT&T will not sit idly by without any competitive response. It believes that there are no restrictions preventing AT&T Communications from constructing its own local bypass facilities. Indeed, the newly reorganized AT&T sees that it is perhaps the only company with the technological and financial means to provide a nationwide web of local bypass facilities.

For the most part, AT&T's competitors are financially strapped and will focus on expanding their interexchange networks rather than on constructing local bypass facilities. However, the competitors may attempt to strike deals with existing bypassers, for example cable companies, which are also financially strapped.

Those who have studied local bypass technologies and the capital required to construct them have decided that the wise course for now is to stand back and see what the local telephone companies and AT&T Communications decide to do. After all, the Bell operating companies and AT&T, in competition with each other locally, might be able to provide much less expensive and more efficient bypass options than those constructed by others.

In addition, the Fortune 100 companies have many uses for capital other than building transmission facilities that may prove to be uneconomic if they are provided at lower cost by AT&T and the Bell operating companies. In addition, most of the big companies lack the skills necessary to manage complex telecommunications networks. This is a short-term problem, but a problem nonetheless.

Therefore, it appears that only AT&T Communications and the Bell operating companies will be in the construction of bypass facilities business, at least on a big enough scale to accomodate the short-term needs of major users.

This year will certainly see further modifications to the FCC's Computer II Decision, which was made in 1980 and became effective on Jan. 1, 1983. Both AT&T and Bell operating company lobbyists in Washington, D.C., are saying that Computer II is irrelevant after divestiture. There is growing sympathy for that view among senior staffers and some commissioners at the FCC.

Computer II requires that AT&T Communications and AT&T Information Systems build duplicate facilities in order to offer regulated and nonregulated telecommunications services. This does not make business or economic sense, but it was demanded by the FCC in 1980 in order to allow competition to develop. AT&T is now arguing that the breakup of the company renders Computer II's restrictions on AT&T's operating flexibility an unfair competitive burden. As a result, there is a good prospect that AT&T may be relieved of some of the restrictions placed on it under the terms of Computer II.

The Bell operating companies also want to amend Computer II in two areas: customer premises equipment and the offering of enhanced telecommunications services. Under the terms of Computer II, the Bell operating companies can offer customer premises equipment only via a separate subsidiary. The separate subsidiary restrictions, the Bell operating companies claim, add unnecessary costs, cause customer confusion and restrict the Bell operating companies' flexibility.

Furthermore, Computer II and the Modified Final Judgment appear to prevent the Bell operating companies from offering enhanced telecommunications services on a deregulated, detariffed basis, even if a separate subsidiary is formed. Therefore, the Bell operating companies will seek clarification from the FCC regarding whether or not they can provide enhanced services and, if so, under what regulatory or deregulatory conditions. Judge Greene may also be involved.

The two former allies are going to find themselves locked in competitive battles in toll markets, local telephone bypass, customer premises equipment and enhanced telecommunications services. The fact that AT&T and the Bell operating companies have the financial and technical resources to compete vigorously in these markets may have a chilling effect on potential competitors.

Nonetheless, the operating flexibility of both AT&T and the Bell operating companies will be determined by the FCC, the courts, the U.S. Congress and the state regulatory authorities. ■

Pearce, a regular contributor to On Communications, *is president of Information Age Economics, Inc., Washington, D.C.*

THE NON-INTEGRATION OF VOICE AND DATA

BY PATTI HARTIGAN

Non-integration

narrow. Until just recently, a voice manager consisted of person who looked at the phone bills to make sure that 400 clerks weren't making long-distance calls to their mothers. A clerk could do the job.

The Lanes are two of the many voice communications and data processing managers that are confronting each other face to face. As voice and data merge, it is becoming more and more complicated — and more and more crucial — to manage the two functions effectively. When the two functions are separate, problems of redundancy, incompatibility and cost-effectiveness arise. A firm may be supporting two networks when one network would suffice.

Such excess can and should be trimmed off the corporate budget, but in order to do so, data processing and communications people must work together, perhaps even be consolidated into one department.

But what happens when two previously separate functions are forced to grow closer together? Is there a race to see who calls the shots? Do they repel each other like oil and water? Does one function reign, making the other obsolete?

Surprisingly, many consultants contend that there is no conflict, that the problem was solved years ago when digital switches were first introduced. George Colony, president of Forrester Research, Inc., a Boston-based consulting firm, said he conducted a survey of Fortune 500 companies. "Typically, I saw telecommunications coming under DP control," Colony explained.

"I also saw the emergence of Swat teams, consisting of the DP manager, the telecommunications manager, the [management information systems] manager and the vice-president of finance or administration," Colony continued. These committees plan and coordinate purchasing, eliminating the problem of network redundancy and planning for future growth.

But what happens when you move out of the boardroom and into operations? The problem, it turns out, is a bit too complex to be solved by a committee.

I've never been fond of committees. It's like putting a Democrat and a Republican in the same office and telling them to solve our economic problems. They may have the same goal in mind, but their methods are going to be totally different.

John Lane

For now, a committee can be effective in determining priorities and objectives. But in terms of management, I don't think you can have two separate entities managing one collective item. You would have infighting all the time.

Judith Lane

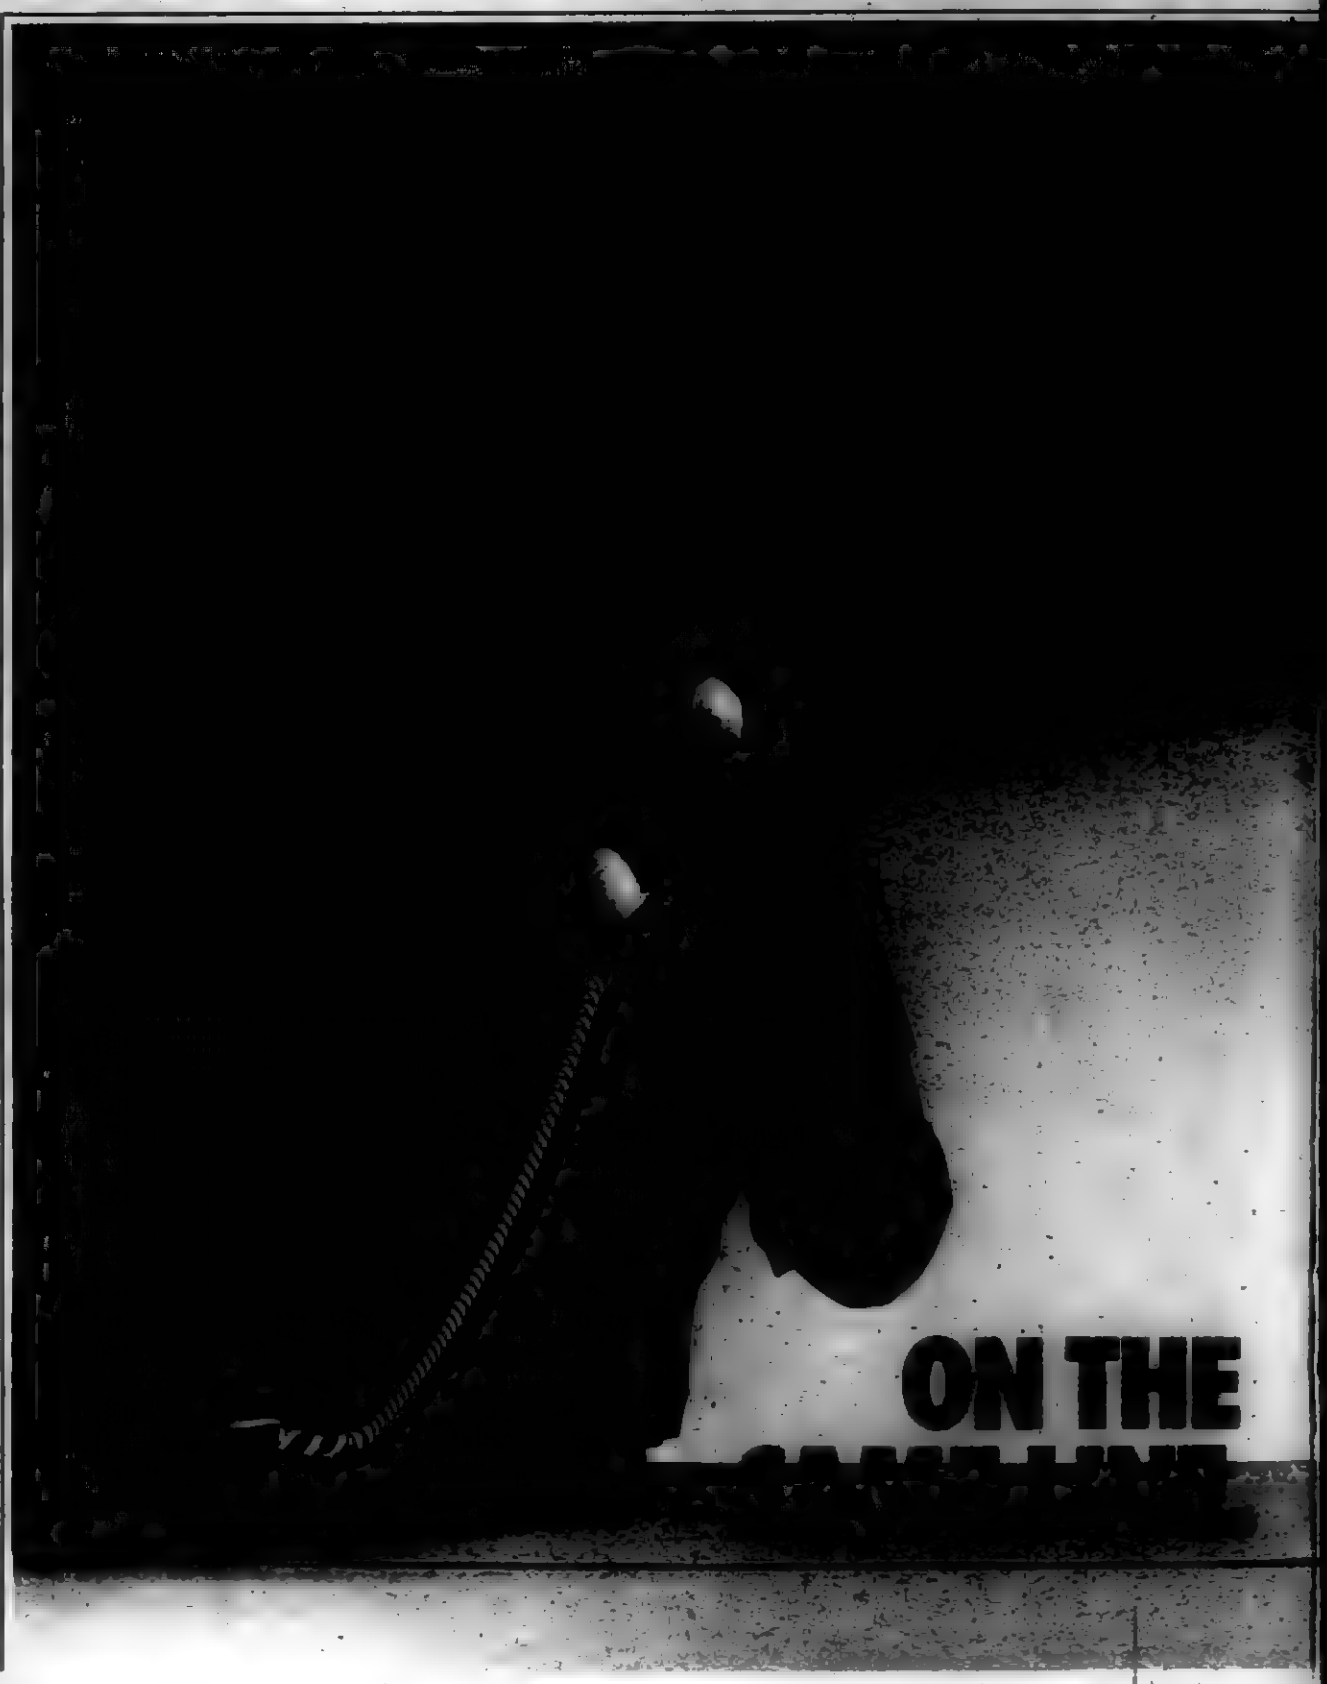
A committee would not have solved the conflict that arose several years ago at a high-tech firm with offices scattered throughout eastern Massachusetts. According to the company's former voice communications manager, voice and data were separate functions, with voice part of corporate services, which was in turn, part of administration. Data was part of information resources, which housed the DP shop. In 1979, the voice communications department set up a microwave network to bypass the local telephone company.

According to the former voice manager, who wished to remain anonymous, relations between the two departments were far from tranquil. "We tried to talk the MIS people into using the microwave network, but we were put off. They feared we were going to take over because we controlled the transmisson," he said. The data people did not begin to use the microwave network until 1982. "Things boiled down to a political situation," he remembered. "People weren't considering the corporation; they were considering their own political well-being."

SO, THE PEOPLE IN voice communications decided to "fight a war," in the words of the former voice manager. This war centered on territorial issues and on who could do a better job managing the communications function. "In addition to having a sophisticated shop, the voice people were also in charge of the data communications budget. And the data people were not very good at planning, didn't understand the technology," he explained.

"We considered the DPers to be wasting a lot of money, which may or may not have been a legitimate complaint, but that was how we perceived it. They weren't as user-oriented as we were. When things were happening, they did not respond in a fashion that we thought appropriate. So in order to protect ourselves and the corporate interest, we had to take over that responibility."

This, needless to say, did not go over big in the data department. "They resented that we had control of their budget and bashed them over the head every time they did something we didn't



agree with," the manager explained. "If we asked for an explanation, they didn't feel it was required for them to explain."

But as in any war, there was a price to be paid. "We won the war, but we lost the peace," he said. Data was finally introduced into the microwave network, but in addition, voice communications was absorbed into the MIS department. "It would have been all right if we simply got integrated with data communications. But we had to report to data processing people who really do not understand communications whatsoever and who made a lot of bad judgment errors."

As a result, there were casualties on both sides. "There was a lot of attrition on the data side," he explained, "and I left in 1982."

The problem, however, did not simply involve control, but also involved a lack of understanding between the two departments. "The most unfortunate thing was that the people we were given to in data processing did not appreciate us, nor did they understand what the hell we were doing," he added.

According to the former voice manager, this problem is not unique to his former firm. "Many DP shops are extremely conservative," he explained. "A lot of them are low risk takers. These days in communications, there is no such thing as no risk: Everything is risky. If you take no risks, you will sink in place. In order to stay above water, you've got to take risks. Many DP shops are not used to that," he explained.

Two crucial issues arose at the firm described above. "We fought two wars," the former manager explained. "The first involved who takes over — the communications people or the DPers. The second war involves where in the organization the merged function will fall — under communications or management information systems."

The first war — who will lead the merged functions — tends to be territorial. Clearly, both sides agree that the leader must have a working knowledge of both functions. However, they disagree about where that leader will come from. Both sides take a chauvinistic stance, each defending his own discipline as the best breeding ground for the leader of the merged functions.

A good data manager would probably be able to learn voice communications concepts in a fairly short period of time. I do not believe that that is true of the voice people that I have met.

John Lane

You find people in voice more amenable to learning data. Data is easier to learn because it it more highly structured.

Judith Lane

Although the Lanes were interviewed separately, their reasons for defending their respective disciplines tend to be mirror images, with each one claiming the same advantages and criticizing the other for the same disadvantages. Each partner in the marriage tends to cling to the idea that his discipline is more sophisticated than the other, that it is harder to learn.

Firmly entrenched in his or her own discipline, both managers take pride in what they do. It took them years to acquire their knowledge, and they do not think just anyone off the street, or from another department, could pick up this knowledge in a short period of time. They do not necessarily have a mutual disrespect for the other side, but more a firm respect for their own discipline, exaggerated by the possibility that their specialty may receive the short end of the stick when the two functions merge.

In addition, in the post-AT&T divestiture environment, there is a wider array of options than ever before and an encyclopedia of tariffs to consider. And both data processing and voice communications managers claim that they have more experience with handling these issues.

Most data managers have had to buy leased lines, to deal with direct-dial charges and make decisions about whether it is cheaper to dial direct, to buy a leased line or to go microwave. Until just recently, I don't think any "communications manager" on the voice side had that many options.

John Lane

The voice manager has so much more to consider than the data manager. He has to watch out for traffic and cable problems, worry about the equipment on the switch. He has to understand grade of service, to queue or not to queue, how to distribute calls, decide on the kind of transmission facilities, how to route those calls and so much more.

Judith Lane

The Lanes could argue at length about which technology is more sophisticated, which discipline breeds a better manager for the merged function. But at some firms, the problems of the "first war" — who will lead the merged functions — can be avoided, without two bruised egos struggling to gain control of the merged functions. For example, at Kaiser Permanente, a health maintenance organization based in southern California, the problem between communications and data processing was strictly organizational. And the "second war,"

Make sure your modem has all these PC:IntelliModem features

Integrated Voice/Data
- Switch between voice and data communications
- Programmable telephone handset jack

Status Reporting
- Line status detection (dial tone, busy, ringing, voice answer, modem answer, incoming call)
- Audio monitor
- Programmable LED

PC:IntelliCom Software Included
- 99-name on-line telephone directory
- Auto-dial, auto-repeat dial, auto-answer
- Link to another number if busy
- File transfer
- Data capture to diskette
- Programmable auto log-on sequences

Compatible with Crosstalk™/PC-Talk III™

Receive Sensitivity: -50 dBm

Speeds: 110, 300, 1200 baud

PC:IntelliModem is now ready to make connections with computers—and people—much faster and more conveniently. It's like getting a modem *and a telephone* for the price of a modem alone.

The ultimate status seeker.

The PC:IntelliModem also monitors your telephone line's status more closely than other modems. It listens to the line much like you do, and detects signals for dial tone, ringing, busy and voice—some of which other modems completely ignore. It then automatically takes the

How To Get A Better Grip On Your 3270 Network.

With More Flexibility Than Ever Before.
Getting a grip on your 3270 applications is a real challenge. You've got to find the best way to bring IBM host applications to non-3270 terminals and personal computers. Without a lot of fuss and bother.

Fortunately, Datastream has a flexible solution. One that won't cost you an arm and a leg.

With our 3270 SNA or BSC Cluster Controllers, you can attach personal computers, ASCII terminals and printers to IBM hosts, giving more people 3270 functionality. And giving you more control of the computing activities in your company.

Our Multi-Path Controller allows personal computers and ASCII terminals to communicate not only with multiple IBM mainframes, but with minicomputers (including DEC®) and time-sharing hosts as well. It even allows personal computers and terminals in the network to talk to each other.

All Datastream controllers feature security, dial-in or direct-connect access, remote dial-in diagnostics and more.

To extend your 3270 investment even more, use our controllers with Datastream's low-cost Display Stations. They offer 3278 functionality keystroke-for-keystroke. Plus features even IBM doesn't have. Like DEC VT100 emulation. Remote dial-in. Additional soft keys. And other 3290-type keyboard features like 24 PF keys.

All this makes for a very tidy, secure, economical way to expand your network.

And put 3270 within everyone's reach.

where in the organization the merged function will fall, was solved without a battle.

Until just recently, voice communications was under facilities design and construction at Kaiser Permanente. "It just so happened that the way this organization was structured for years, the major role of communications was in support of our billion-dollar building program," Joseph Bedard, the health firm's communications manager, explained. "We build a considerable number of medical centers and clinics, so the real role of communications in the past focused on building needs.

"Today with the integration of voice and data, that role is changing," he pointed out.

The voice network has always been dominant at Kaiser Permanente, but there has been substantial growth in the data network over the past few years, according to Tom Fleshman, the firm's director of information systems, which traditionally housed DP. "The two areas were not in direct confict, but they were not always talking to each other," Fleshman explained.

"Each side went along and did its own thing, until it got to a point where the two could no longer coexist without a joint focus and integration," he added.

In November 1983, voice communications was absorbed under information systems, and as yet, no problems have arisen. Asked if he felt any tension about the move, Bedard answered with a simple, "No, none at all.""

Fleshman agreed. "As far as I can tell, there is no tension," he said. "In fact, I have been told by the communications manager and others that this was a positive move for them, that it provided them with a broader career path," the information systems director said.

The same solution, however, might not prove as smooth at another organization. "I have been here 4½ years, and there has never been any problem between the voice and data people," Fleshman pointed out. "That is not what precipitated this; that is not the issue at all.

"In other companies, if there is an all-out war, the same type of solution might not work," he explained.

"It depends on a lot of things: the nature of the business that the organization is in, to what extent communications plays a role and what type of role it plays.

"For example, for us, no matter how large our data network gets, voice will always be dominant. It is the key access into our system. Our patients' main entrance is via phone to make appointments, talk to doctors and so on. We run something like 23,000 voice lines," Fleshman said.

"If another company were to look at us and say 'Gee, should we put it all under DP?' — I don't know. It depends on the people involved, the comfort level of management, the track record and so on, rather than the turf issues of who it should report to and so on," Fleshman added.

It really boils down to which is the most sophisticated department. But I strongly suspect that in the larger companies, the most logical place to put a consolidated function would be in data processing.

John Lane

Where the merged function falls depends on the company. What kind of network do they need? Voice and data will probably remain separate entities but under one realm — communications.

Judith Lane

Just as the question of where the merged function will fall depends on the individual organization, the answer to the conflict between DP and communications depends on each particular case. There is no simple solution to the problem; in extreme cases, the only possible answer may be a complete reorganization, restaffing and time to heal.

Although the problem can rarely be avoided, it can be cushioned. Managers need to educate themselves, to learn more about the other discipline, keep an open mind. This is easier said than done, for there is a vacuum in the market for managers with a working knowledge of both disciplines. However, there is a world of opportunity for managers able to ride the wave of change.

Is there hope, then, for an eventual resolution of the conflict between voice communications and data communications managers?

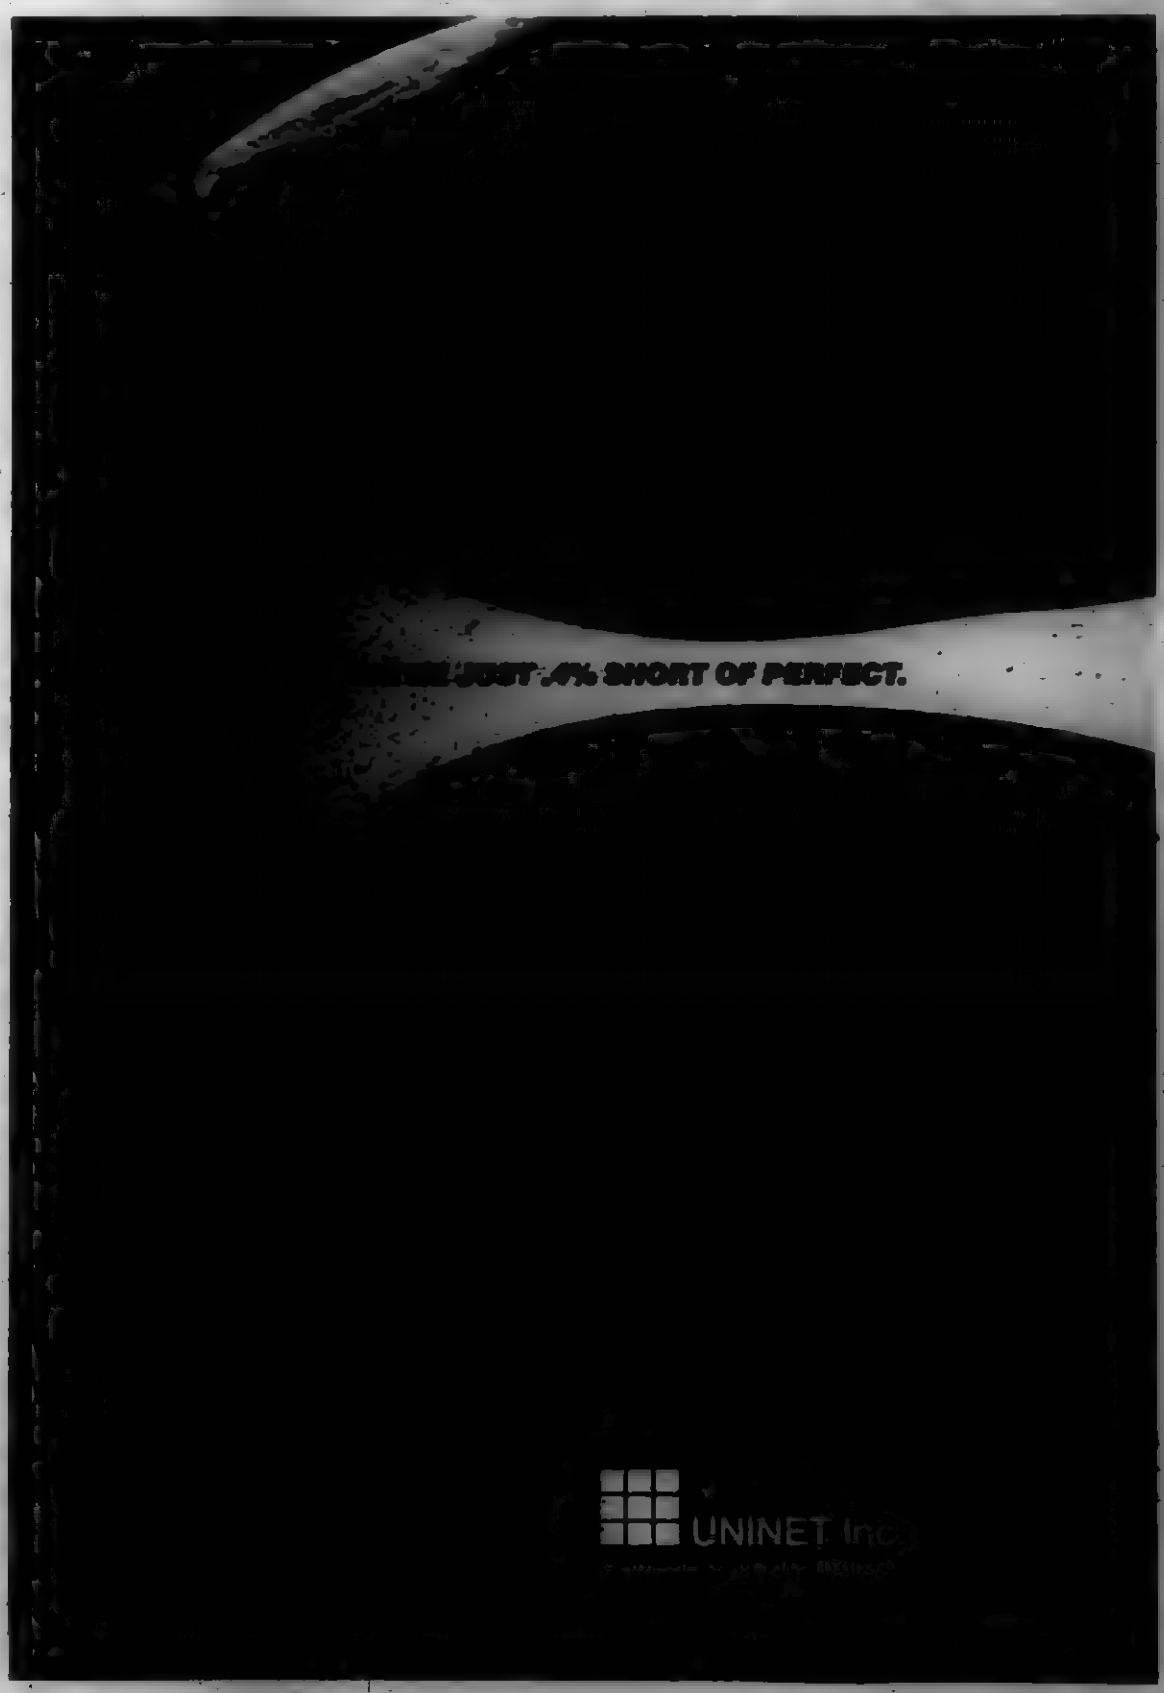
The two will always be fighting to some extent. Their priorities tend to be different, their background, training. I'm not sure you'll ever get a perfect blend of that.

John Lane

I think ideally, the two can work happily together, but they must be administered. One person manages the information and the other makes sure that Jack can talk to Jill — and it doesn't matter whether Jack is a computer and Jill is a computer or Jack is a manager and Jill is a customer or whatever.

Judith Lane

Will Judith Lane's prediction prove right? Or will the conflict continue? Only time will tell. ■



DOUG SMITH

THE UNCERTAIN FUTURE OF CENTREX

BY JEFF KAPLAN

One of the most important issues facing many telecommunications managers as they attempt to adjust to the new AT&T and reacquaint themselves with their local telephone companies is what to do about their Centrex systems. The Federal Communications Commission's (FCC) Feb. 3 decision to stand by its local access charge scheme for Centrex services may mean significant increases of $2 per line per month in the telephone bills of Centrex subscribers. This prospect may drive these major users away from Centrex, leaving the local operating companies with a huge chunk of unused central office switch capacity. In addition, it may settle small business and residential users with even higher local telephone costs.

However, favorable state tariff rulings permitting more flexible pricing and rate stability may help to offset the added access charges and limit the amount of migration away from the Centrex service.

For the uninitiated, a brief description of the Centrex system is in order. Basically, Centrex is a service offered by all the Bell operating companies and a handful of independent telephone companies. It links each of an organization's telephones to a central office switch located at the operating company's plant. The service was first developed in the early '60s to give large organizations direct dialing capability in and out of the organization. The system evolved to include basic station features such as intecom, call holding and call transfer.

Eventually, two forms of Centrex emerged. Centrex-CO has been the standard service emanating from the central office switch. Centrex-CU combined basic central office service with additional on-premises switching. As a result of AT&T's efforts to move subscribers toward its private branch exchange (PBX) products, the Bell operating companies no longer offer Centrex-CU.

The debate over the local access charge plan has brought together strange bedfellows, like the local operating companies and state regulatory agencies that oppose the plan. It has also brought out some of the subtle tensions that have been brewing between AT&T and its newly emancipated operating companies. (This debate is elaborated on in "Pro and Con," Page 4).

But based on extensive interviews with federal and state regulators, congressional staff, interconnect industry representatives and marketing people in the Bell operating companies, International Data Corp. (IDC) believes that predictions of Centrex's abandonment and demise in 1984 and after may be exaggerated.

There were approximately 7,425 Centrex systems installed at the end of 1983, according to the North American Telephone Association (Nata). This represents a 50% drop in the number of systems installed since 1981, when 15,100 systems were in place. This number appears relatively small when compared with the nearly 21 million PBXs that Nata estimates are currently installed in the U.S.

However, it is unfair to compare the number of Centrex systems with the number of PBX instruments in place. The operating companies charge Centrex users on a per line basis. And new central office switches enable the Bell operating companies to offer customized Centrex service with additional features to smaller offices with fewer telephones than in the past. Because the service can now be directed at smaller clusters of telephones, the number of lines served is more important than the number of systems installed. Some analysts guess that 60% of the Fortune 500 companies and an even greater percentage of major nonprofit institutions use Centrex.

Centrex service represents a major component of the basic operations and revenue structure of the Bell operating companies. In Massachusetts, 122,000, or 22%, of New England Telephone Co.'s 579,000 business lines are dedicated to the Centrex-CO service. Over 52% of the main station lines provided by Chesapeake and Potomac Telephone Co. in the Washington, D.C., area use the Centrex system. And approximately 46% of the business lines in California are serviced by Centrex.

As an office switching service that provides an array of station features to improve telephone efficiency in organizations, the Centrex-CO competes head-on with PBX systems. The fundamental difference between the two is that Centrex performs all switching functions off-premises by establishing a separate loop for each telephone station, while the PBX is installed on the premises where it switches stations internally and feeds and sends external calls through trunks.

There are additional factors that differentiate the two systems. Financing and service have been the two most important. Centrex users pay an installation fee and monthly charge per station adjusted by the number of stations connected to the central office switch and the add-on features requested. This permits smaller organizations or organizations with limited funds to avoid a heavy capital outlay for an on-premises switching center. Total system shutdowns are also avoided under Centrex because each station is individually linked to the central office switch. PBXs require special power-support systems to ensure that an organization's telephone lines are not lost if the office suffers a power blackout.

PBX systems offer the user greater control and cost savings through customized design for an organization's unique needs. Organizations can expense their financing costs and depreciate the system over time. After system features, relative independence from the local operating company is the intangible goal and advantage that PBX vendors emphasize most.

Both systems were originally ▶

Kaplan is a senior market analyst in telecommunications for IDC's Communications Research Program, Framingham, Mass.

configured for analog transmission, but today's trend is toward digital traffic capability. Third-generation PBXs offer add-on digital transmission capability, and analog/digital converters have been used to permit data communications through the Centrex system. The Bell operating companies have been making a concerted effort to replace or upgrade their central office switches to permit routine high-speed data traffic. At the same time, fourth-generation, fully digital PBX systems are expected to come to market within the year.

Because they add an additional system to the telephone network, PBX systems can cause some switching impairment on-premises and transmission degradation. But PBX users have been willing to make this short-term sacrifice while the overall telephone network is upgraded to accommodate the on-premises systems.

Centrex began to lose its luster in the late '70s. AT&T strategists believed that Centrex could not compete against the new PBX offerings over the long haul. As a state-regulated service, Centrex lacked the price flexibility necessary to compete in a price-sensitive market. And under the Modified Final Judgment of 1982, the divestiture plan accepted by AT&T and the Justice Department, the Bell operating companies were prevented from providing enhanced services and customer premises equipment unless they set up separate unregulated subsidiaries. This severely limited the operating companies' ability to market Centrex.

AT&T introduced its own PBX, the Dimension system, and instructed the Bell operating companies to push its offering. Centrex was not stressed in AT&T's 1982 market strategy.

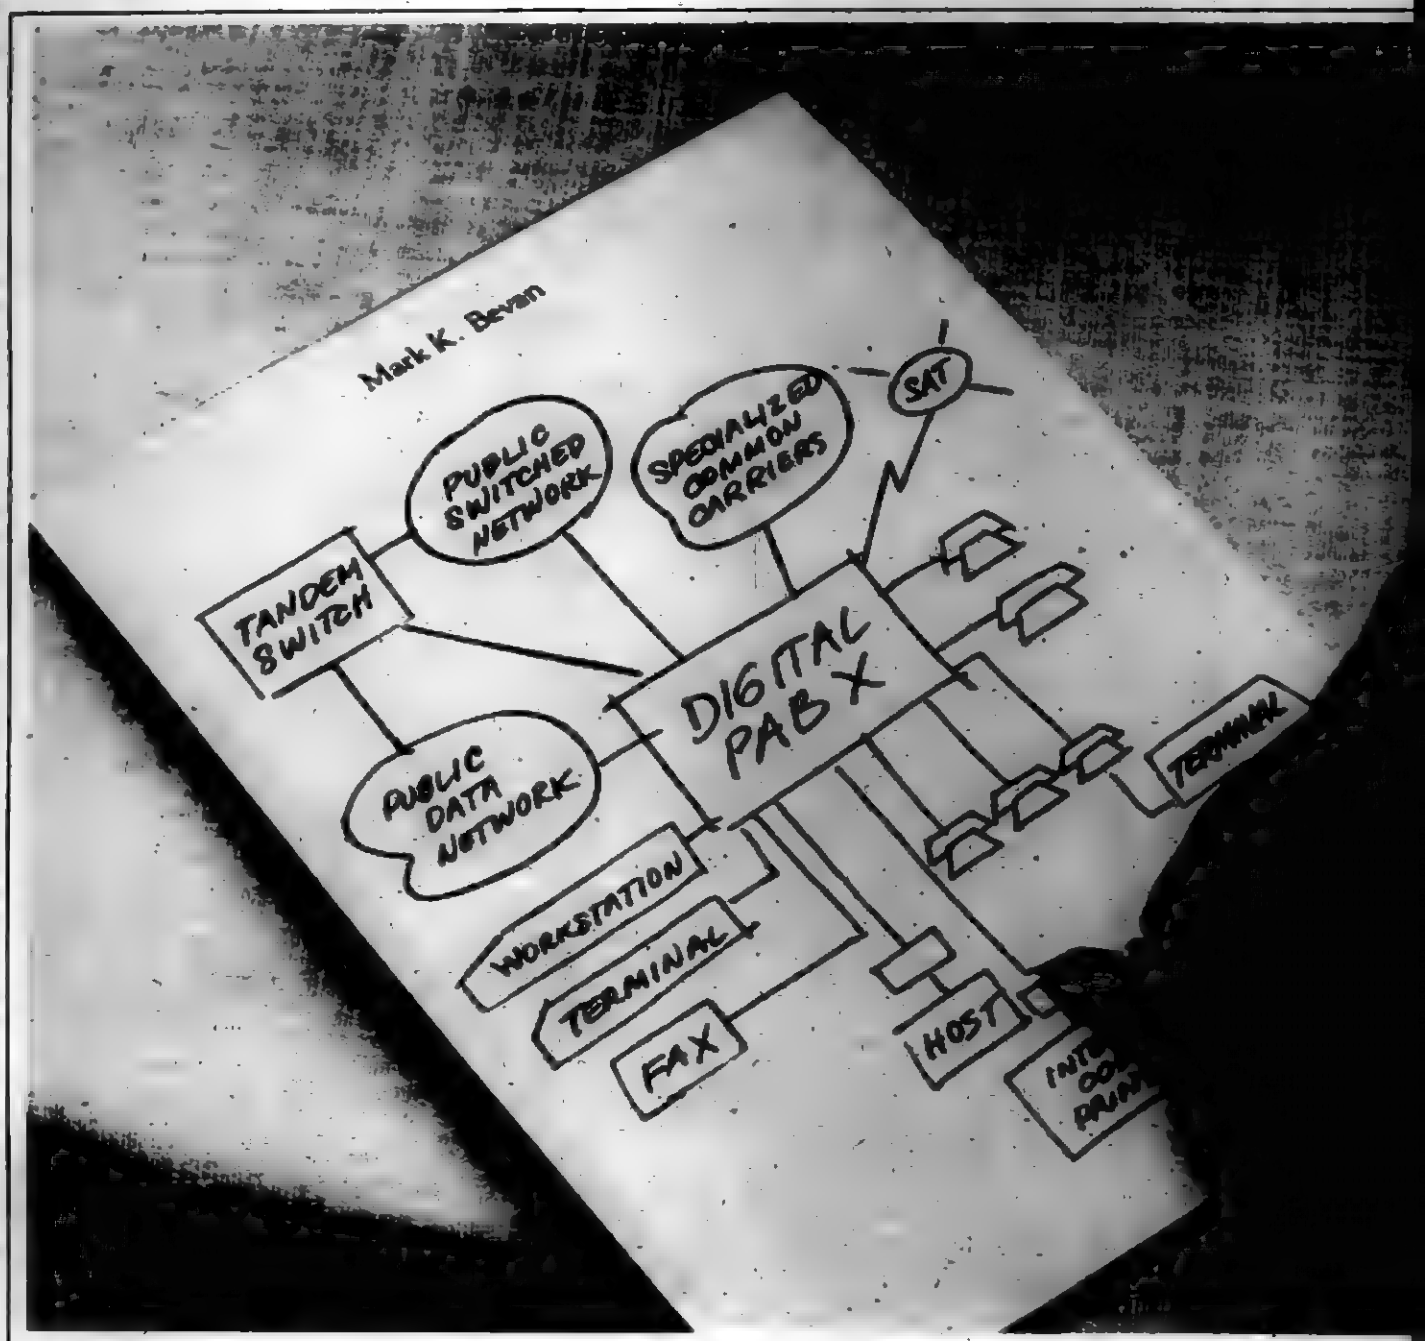
The Dimension system and early System 85 releases encountered a series of engineering and delivery problems. American Bell, Inc., AT&T's unregulated subsidiary responsible for marketing PBX products, struggled through internal political and organizational problems as well. It emerged with a new name, AT&T Information Systems, and a credibility problem to overcome.

The Bell operating companies attempted to make the most of a difficult situation. AT&T had negotiated a favorable deal with

The Bell operating companies have been making a concerted effort to replace or upgrade their central office switches to permit routine high-speed data traffic.

the Justice Department, which freed it of the burdens of local operations and state regulators. It took the most profitable business — long-distance services. It preserved its vertical integration by retaining Bell Laboratories, its research and development arm; AT&T Technologies, formerly Western Electric, its manufacturing operation; and AT&T Information Systems, its young marketing vehicle. It left the Bell operating companies with the difficult task of local switching and service. The Bell operating companies were given Centrex and its significant central office switch investment, but they were not given the freedom that they needed to earn the return that they required.

The Bell operating companies attempted to salvage Centrex and pushed favorable tariff decisions



It used to take six different companies to build a communication system like this.

Now it only takes one.

through state public utility commissions. The tariff agreements permitted more flexible rates and long-term contracts that ensured rate stability. They lowered or eliminated their minimum line requirements, allowing smaller offices to take advantage of Centrex. This also allowed the Bell operating companies to expand their market base. Pacific Northwest Bell gained approval of a new Centrex system called Centraflex, which is offered to business and residential subscribers with only two lines or more. And the operating companies continued to add service features, such as call forwarding and station message detail recording, to remain competitive with PBX offerings.

On Dec. 22, 1982, the FCC issued its Third Report and Order, which called for local access charges, including the customer access line charges that concern Centrex users and the Bell operating companies. Under the FCC's original plan, all lines entering a local operating company's central office switch would be charged a monthly access fee beginning Jan. 1, 1984. The plan was based on the premise that all users of the local telephone network should pay for the fixed or nontraffic-sensitive costs associated with operating the system.

The FCC's plan was the first step in its efforts to transform the regulated telephone rate structure into a cost-based system. Rather than allow long-distance users to continue to subsidize the local network through artificially established rates, the FCC determined that the AT&T breakup should serve as an impetus for a more rational rate structure.

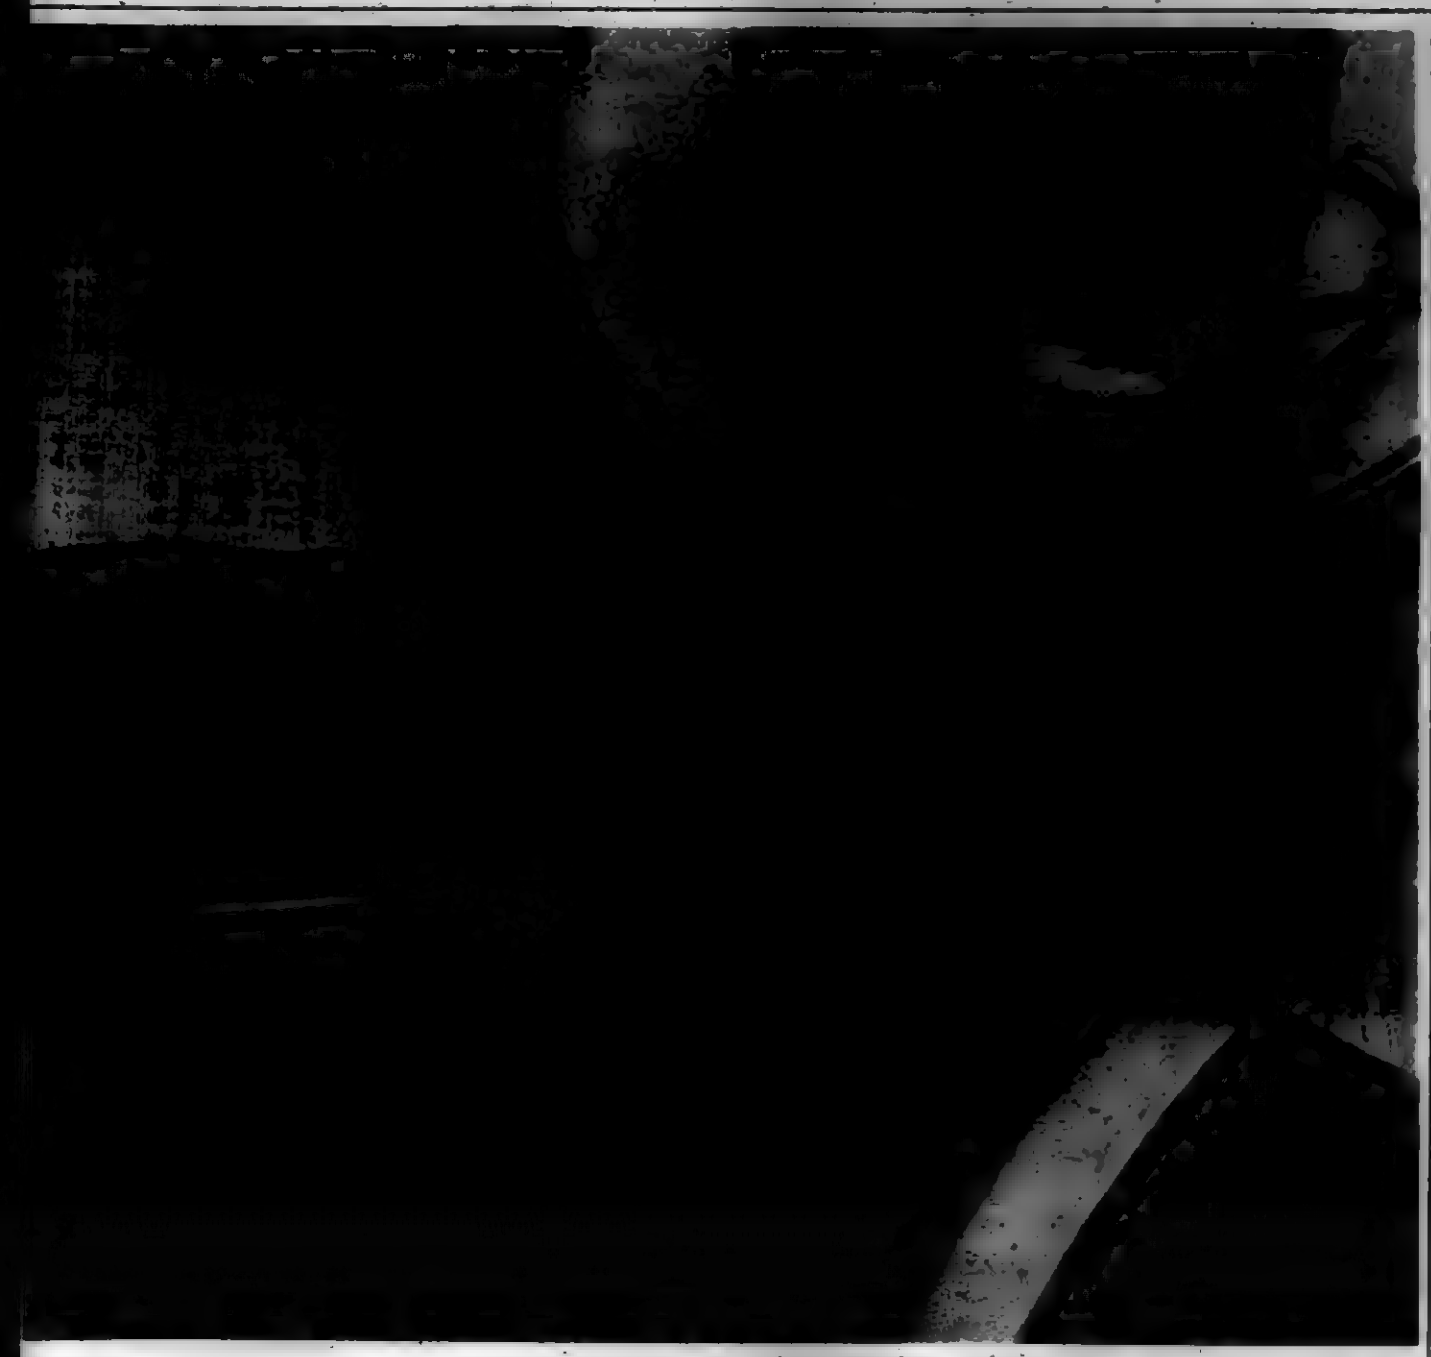
The FCC proposed that residential users should be charged a maximum of [illegible] per month per line beginning in 1984 and eventually pay a maximum of $6 a month per line in 1986. Business users would immediately pay a maximum of $6 a month per line.

The FCC's plan generated overwhelming opposition. On July 27, 1983, in response to 35 petitions, the FCC issued a Memorandum Opinion and Reconsideration Order modifying its original plan. Under the new proposal, which was published in August, residential and Centrex users would pay a maximum of $2 per line each month for existing lines as of July 27, 1983. The monthly rate would increase $1 per year in 1985 and 1986. New Centrex users or expanded Centrex systems would pay the full $6 per month charge for their new Centrex lines.

Although the FCC reduced the immediate rate shock of its original order, the Bell operating companies and Centrex users were only mildly relieved by the new plan. Under the FCC's modified formula, Centrex users could still pay more than 10 times as much as PBX users in monthly fees. That is because each of the telephones in a Centrex subscriber's office will be charged for tying into the central office switch, while the PBX user will only pay for the trunks that carry its external calls to and from the central office switch.

THE BURDEN of the access charges may fall most heavily on major nonprofit institutions that have relied on Centrex systems in the past and lack the financial resources to invest in a PBX system. The Mayo Clinic and its affiliated hospitals in Rochester, Minn., estimate that they will pay $255,864 per year in access fees for Centrex lines under the FCC's revised plan.

The potential impact of the FCC's plan has generated an unusual ground swell of state and federal lobbying. The nonprofit sector has been led by such organizations as the American Hospital Association. The International Communications Association (ICA) filed a petition with the FCC on behalf of Centrex users, requesting



We've made complex telecommunications simple. As your single source for an entire system we will custom tailor it to your exact needs.

That means fast information flow for both voice and data and increased organizational efficiency. All of which can add up to savings in operating costs.

We provide all components from telephones, to terminals, to PABX's, to transmission equipment. And we offer the experience needed to build a system that will serve you effectively today and grow with you in the future.

Fully integrated data capability and advanced features will be available through easily implemented system upgrades. Just as important, we offer a service organization that will be there when you need them.

But our communication services don't stop at your office door. You can use GTE's Telenet public data network and Telemail electronic mail system to speed communications throughout the country. And GTE's Satellite Communications subsidiary can link your office to a satellite.

In a field as complex as telecommunications you'll find you can simplify your problems by dealing with the company that has it all.

For more information write Marketing Services, GTE Business Communication Systems Incorporated, 12502 Sunrise Valley Drive, Reston, VA 22096. In Canada, AEL Microtel Limited, 1211 Denison St., Markham, Ontario L3R 4B3.

We've simplified a complicated business.

GTE Business Communication Systems

a further reconsideration of the local access charge plan.

State regulators also solicited Centrex user statements and submitted their own petitions to the FCC. The state regulators believe that a large number of Centrex users will abandon the service if the access charge stands. This will leave the Bell operating companies with a significant amount of unused central office switching capacity. In order to recoup their investment in this equipment, the Bell operating companies will be forced to boost their local rates, particularly those of residents and small businesses.

Northwestern Bell estimates that it will lose 92% of its existing Centrex lines within three years if the FCC plan is enforced. Pacific Northwest Bell predicts that all of its 24 largest Centrex users in Washington state, accounting for 72.8% of the state's Centrex lines, will abandon the service by the end of 1986. This will leave a stranded investment of nearly $35 million.

The state regulators asserted in their petitions that although the FCC's plan is well-intentioned, it is poorly designed. They claimed that Centrex rates were set at the state-level to be cost-sensitive and bring an adequate return to support local operating costs. Therefore, the FCC's local access charges would be an unnecessary surtax on Centrex users to cover costs that have already been provided for.

Not only may the FCC's charge on Centrex users be unnecessary, but a petition submitted by Northwestern Bell, Mountain Bell and Pacific Northwest Bell claims that the FCC plan may even be counterproductive. The Bell operating companies predicted that if a major share of their Centrex users abandon the service in the next two years in favor of PBXs, as their surveys indicate they will, then the local operating companies in this region stand to lose $700,000 per month in access fees due to a reduction in the total number of access lines entering central office switches.

As a compromise, the Bell operating companies, state regulators and Centrex users proposed a PBX-equivalency formula to the FCC for determining the local access charges on Centrex subscribers. Under this proposal, a Centrex user with 100 lines would pay the same overall charge as a PBX user with trunking capability up to 100 lines. This proposal was based on the assertion that the bulk of the telephones and lines used by Centrex subscribers are used for intra-office communications. Therefore, their lines are not imposing an equal burden on the central office switch and should not be charged a flat rate. The proponents of this approach suggested that engineering data could have been used to determine an appropriate formula.

The PBX-equivalency concept was vehemently opposed by PBX manufacturers and vendors. Nata, representing the interconnects, attacked the scheme and the Bell operating companies' efforts to protect Centrex.

The interconnects believe that Centrex, by virtue of its direct-line architecture, cannot be equated with PBXs. In their petitions to the FCC, they point out that although each Centrex line may not be used for external communications, each one has that built-in capability, placing the same burden on the central office switch regardless of how it is actually used. Because of this, the interconnects call a PBX-equivalency formula inappropriate.

The second area of contention between the interconnects and the Bell operating companies is over the definition of enhanced services. Under the Computer II decision and the Modified Final Judgment divestiture plan, AT&T and the Bell operating companies were prohibited from offering any products or services that represented an enhancement to their basic transmission function, except through a separate unregulated subsidiary, such as AT&T Information Systems.

The interconnects' petitions to the FCC contend that the new features being offered for Centrex — such as least-cost routing, call forwarding and storage and automatic call distribution — represent enhanced services and violate Computer II and the Modified Final Judgment. The Bell operating companies' petitions respond that the new services are now possible because of hardware enhancements rather than software enhancements and are within the legal restrictions.

AS IF THE CENTREX issue was not confusing enough, Congress decided to get into the act in the fall of 1983. In November, the House of Representatives, concerned about the impact of local access charges on residents and small businesses and the threat they posed on universal service, passed H.R. 4102, which called on the FCC to revise its plan. The legislation did not specifically address the Centrex issue, but instructed the FCC to review its

plan's impact on nonprofit institutions and state and local governments that rely on Centrex.

Congressional aides incorrectly predicted that the Senate would pass similar legislation by February. But the legislation was put off until next year.

The Reagan administration also criticized the FCC plan, but expressed concern about legislative actions that delay or disrupt the smooth implementation of the AT&T divestiture.

AT&T initiated an intense lobbying campaign to prevent Congressional intervention and further modifications of the FCC plan. It threatened to retract its proposed long-distance telephone rate reductions if the access charges were lowered or if they were withdrawn.

Amid all of this controversy and confusion, the FCC decided to delay the implementation of the local access charges until April 3, 1984. Although the FCC continued to stand behind its plan, it has decided to reopen the issue and welcome a new round of petitions concerning the proposed charges.

In a surprise move on Jan. 19, the FCC accepted a staff report recommending that the $2 monthly charge on residential and single-line business users be put off another year to allow the FCC more time to reevaluate its plan. At the same time, the FCC upheld the $6 monthly charge on multiline business users. The Centrex issue was left unanswered until Feb. 5, when the FCC decided to uphold its July 27, 1983 ruling.

It is clear that the FCC made a calculated political move to diffuse the public backlash to its local access charge plan when it postponed the $2 monthly fee on residential and single-line business users and let the charges imposed on multiline users stand. The one-year postponement will push the charges back until after this year's elections, making the charges less of an immediate political issue. But the FCC 's decision to stand by the charges on multiline businesses will certainly generate greater migration from the local telephone networks toward PBX and bypass technologies to avoid the access fees.

It appears that the FCC's decision has ended Washington's role in the access charge controversy for the time being. The ICA will review the FCC's action and may file for further reconsideration on behalf of Centrex users, but no substantive changes are expected from the FCC. And Congressional aides believe that Congress will not come to the rescue of Centrex users in the way that it was willing to intervene on behalf of residential and small businesses.

IN THE MEANTIME, THE Bell operating companies and the Centrex users are not sitting still. The Bell operating companies have submitted new rate filings to state regulators and revised their Centrex pricing schedules to compensate for the local access charges if they do become a reality. Rates are expected to be reduced so that the impact of the charges on subscribers is minimized.

The Bell operating companies are also investigating ways to live with the the concept of structural separations between their regulated and unregulated businesses as outlined in Computer II and the Modified Final Judgment. Although all of the Bell operating companies claim that they have not crossed the invisible line into the area of enhanced services, in recent interviews with IDC, several Bell operating company officials had a difficult time avoiding the term while describing the new features they will offer Centrex subscribers.

Several regional holding companies and Bell operating companies are discussing joint venture agreements with interconnects as one method of circumventing the structural separations requirement. Under these agreements, they will refer Centrex users to the outside vendors for the enhanced service features.

Major Centrex users are not sitting around either. Anticipating that the selection process and installation time for a PBX system is over two years, many Centrex users have issued requests for proposals to PBX vendors to get ready in case the local access charges stand.

Despite the controversy and confusion surrounding Centrex, IDC believes the pronouncements of its demise are premature. Although some of the regional holding companies are still uncertain aobut how to market Centrex, others have been quick to promote it as their flagship service. The regional holding companies and local operating companies have staff committed to the service and are ready to revise prices and add features to hold their subscribers. They believe they offer a viable switching system and that user loyalty and their commitment to service will see them through this challenge.

Because of this determination and the added service features that will be available for Centrex, IDC believes the service will survive the access charge threat and withstand the PBX challenge. ■

Era One saw the personal computer increase the productivity of the business executive dramatically. Yet for all their power, personal computers have not fulfilled their potential. Because the different makes have been unable to communicate reliably with one another and with the various public data networks.

A new era in dependability. Era 2's electronics are so well put together we're able to offer a four-year warranty-twice the term of protection you get from yesterday's products.

On top of that our product support is outstanding. Our 800 number operates 9AM to 8PM (EST), Mondays through Fridays, 9AM to 5PM Saturdays with experts available to solve any problem or answer any question.

Era two.

But now, Microcom moves the personal computer into a new era of communications compatibility with Era 2–the first Personal Computer Communications System with the industry-standard communications protocol MNP. Era 2 finally enables dissimilar personal computers to communicate with one another reliably and cost effectively. It also allows the personal computer to access public data networks easily and error-free.

The state of the price of the state of the art.

We're able to offer Era 2 for an amazing $429. By any standard the price/value ratio of Era 2 is outstanding.

A closer look at Era 2.

Era 2 with MNP is a 1200 baud Communications System (software and inboard modem) designed to operate with the IBM PC, PC XT, compatibles and PCjr; Apple IIe, Apple II Plus and Apple II. Its features include IBM 3101, Digital VT100 and VT-52 terminal emulations. Era 2 executes multiple functions with a single keystroke. Stores a virtually unlimited number of telephone numbers – each one up to 31 digits. Era 2 is Bell 212A compatible, works with Pulse or Touch-tone™ dialing. Its speaker alerts you to busy signals, wrong numbers, etc. Era 2 gives your personal computer error-free compatibility with other personal computers, data bases, mainframes, almost any information source that can be reached by telephone line.

Move your personal computer forward into a new era of communications. Visit your Era 2 dealer soon. Call 800-322-ERA2 (in MA, 617-762-9310) for the name of one nearest you. Or write us, Microcom, Inc., 1400A Providence Highway, Norwood, MA 02062. We'll send you a brochure with complete information on Era 2.

Are these the best or worst of times for the communications industry?
The best of times.

Why?
Mao Tse-Tung had an expression: "There is great chaos under the sun, everything is beautiful."

What is it about chaos that's beautiful?
It presents opportunities for users and those vendors that can see the future better than their competitors. Strategy dictates that a company do something that is different from its competitors. Here is the chance to do something different.

Specifically, for whom are these times good?
It is a good time for the regional operating companies. It is a good time for independent equipment manufacturers. It is relatively a good time for new and enhanced services.

Who's having a bad time now?
AT&T. Anytime you go from a 97% market share to something that in four years may be a 64% market share, you don't really stand up and say this is the best of times. I'm talking about AT&T Communications.

How can companies do what you suggest and find the opportunities?
Opportunities never present themselves as multibillion-dollar opportunities. Often they are small niches that are best taken advantage of by quick, flexible, fast moving, aggressive companies such as Rolm [Corp], Intecom, [Inc.], Ztel, [Inc.] When you round to the nearest 100 million, which AT&T does, you cannot get in markets that are small. You are almost muscle-bound.

Look at AT&T Technologies, an enormously competent company. Yet historically, it only entered a market when the market size was sufficient to support its efforts — in fact, when Bell Labs told it to go and get in that business. Well, these markets are often software-driven today, which means they are kind of customized. It's not like turning out products on cookie cutters.

How will AT&T Technologies fare in the new industry?
I think AT&T Technologies is going to break out. I think it has reached the conclusion that its technology is too impressive to be bottled within AT&T Information Systems. It will look at every available distribution system out there as appropriate vehicles for its technology, including value-added resellers, Computerland, Sears and, once again, the operating companies.

What will it take to win the operating companies back?
An act of faith by AT&T management that it can leverage its position in 256K chips, that it will be market-responsive and that the market will actually salute on products that AT&T Technologies may build.

[illegible] "BE YOUR OWN BELL" [illegible]

The Inc. magazine commendation on Howard Anderson's burnished brown office wall cites his communications research company, The Yankee Group, as one of "America's fastest growing private companies in 1982." Yet that is seemingly not enough for its founder and managing director. What more could he expect?

"The goal of the Yankee Group, and I've never made any bones about this, is world domination," he says. "We want to be the most important company in our industry." For insight on how he expects that to happen, look no further than his business card. Over the company name is the aphorism: "The Network as a Strategic Weapon."

Anderson has already become one of the most important individuals in the communications industry — if public exposure is any measure of importance. Whenever big news breaks in the communications world, as it has so frequently in the past two years, newspapers and magazines call on Anderson for analysis.

The 39-year-old Anderson majored in economics at the University of Pennsylvania and earned an MBA from Harvard Business School in 1968. He worked as a "marketeer" at Shintech, Inc., a computer graphics and facsimile manufacturer. He founded The Yankee Group in 1970 and built it from a one-man operation to a firm with 72 employees and offices in four countries.

The Yankee Group has gone from earning 100% of its revenues from consulting in the early days to just 4% today. Consulting has been supplanted by what Anderson calls "multiclient studies." The studies cover four different areas and are offered to the firm's 425 clients on a subscription basis for $30,000 a year. The goal of the studies is to make sense out of today's turbulent communications times.

A frequent speaker at industry conferences, Anderson combines his forceful delivery with a biting sense of humor. During a recent speech in Washington, D.C., he alluded to his distaste for local-area networks, saying to the audience, "By the way, the Ethernet users group will be meeting outside in the phone booth where they will hold their yearly prayer meeting."

So what does Anderson make of these turbulent times? On Communications Editor Bruce Heard interviewed him last month in his Boston office to find out.

Along those lines, will Bell Laboratories continue to be the preeminent institution it has been?
I disagree with your assumption that it is the preeminent institution. I think that 90% of the problems of AT&T can be directly laid at the feet of Bell Labs. Bell Labs has been a shadow government at AT&T for two decades. Bell Labs made the decisions on what products to make and what not to make. Bell Labs caused development to start or cease. Most manufacturing companies have an R&D lab. AT&T had an R&D lab with an adjunct that did manufacturing. Bell Labs was in fact the tail that wagged the dog.

Can you cite an example?
[Private branch exchanges] — the hottest new market in the U.S. and AT&T did not have an entry.

Why not?
Bell Labs made the decision not to pursue this. One of the reasons was least-cost routing. Putting in a least-cost routing device may give you an equipment advantage, but reduces the amount of long-distance calling. AT&T is a company that historically had Long Lines in the center, and Long Lines always was protected like a king on a chess board. The better the equipment performed, the worse the Long Lines revenue.

What happened was that the users found they could wander off the reservation with a [Northern Telecom, Inc.] SL-1 or with a [Rolm] CBX. Least-cost routing devices like Wats boxes provide an 80% return on investment. With a least-cost routing device, I could take my tie line usage from four hours per day per tie line to seven at no increase in cost. In other words, I'd get almost three free hours of telephoning per day. Bell Labs made the decision not to go in there.

How can AT&T compete?
I think you're going to see AT&T make strategic investments in companies, not unlike what it has done with Olivetti [Co.] or like IBM has done with Intel [Corp.] and Rolm. AT&T realizes it is not going to change the culture of that company overnight. It may not be possible to ever change the culture of AT&T.

Why are things good for the spun-off Bell regional operating companies?
They are a superb distribution system. The real genius of AT&T wasn't Bell; it wasn't his chief engineer Thomas Watson; it was Theodore Vail, because Vail came up with the idea of franchises. And the operating companies are the finest franchise idea since the Catholic Church.

They have always been superb distributors. They were distributing AT&T Technologies gear, and they were distributing Long Lines service for AT&T. They can say, "We are no longer bound to give you only what AT&T Technologies provides, we can give you an Intecom PBX, a NEC Telephones, Inc. Neax 2400 and so forth and so on."

While we are talking about customer

Howard Anderson

premises equipment, what does the sale of embedded customer premises equipment mean? Is it good for people to buy it? Does it lock them into Bell? Will it create a glut of equipment so manufacturers of the fancy new products won't be able to sell their stuff?

It means there is the beginning of a price war, and the user will be the beneficiary of that war. He now has anything from technologically simple to sophisticated equipment to choose from. He may have to put in a special waiting room for all the salesmen who want to call on him. There is not a glut of equipment on the market, and there are 250,000 units that have to be replaced over the next few years. The operating companies are the preferred vendors for customer premises equipment, and Northern Telecom is going crazy supplying it.

What are the implications of users buying all this equipment?

Every major user is becoming what Don Gooding of The Yankee Group calls BYOB — be your own Bell. If you're a large user, you're going to be an integrator. If you have a lot of moves and changes, you're going to hire your own installation and maintenance person to do it. For the sophisticated problems, you may use an operating company.

It used to be if you were a major customer, AT&T Long Lines was where you went. Look at the decisions the user has to make. He's got to make decisions on customers premises equipment. He's probably got 12 decent distributors to choose from — well, make it six. He's got to make decisions on local wiring: Do I do it myself? What do I put in? What kind of topology? Can a hybrid PBX do it? He has to make decisions on local loop: Do I run my own microwave? He has 200 options in the way of long-haul communications. The user has become his own telephone company.

"What I would say to anyone trying to undertand divestiture is that it is a natural occurrence like electrical utilities. You buy your appliances from one person, whether that's General Electric or Sony."

If you had to explain the divestiture of AT&T and deregulation of the communications industry to somebody who was reasonably intelligent but knew nothing about what was happening, how would you tie it all together?

Let me go back a minute. The first research report I wrote was in 1974. It was called "The Unbundling of AT&T." It said the Justice Department will sue AT&T for antitrust. They will attempt to break AT&T into pieces, and they will be successful. The conventional wisdom in 1974, '75 and '76 was that I didn't know what I was talking about. The suit was brought Nov. 21, 1974.

What I would say to anyone trying to undertand divestiture is that it is a natural occurrence like electrical utilities. You buy your appliances from one person, whether that's General Electric or Sony. You buy your electricity from a local generating company.

What's the biggest misconception business users have now about the post-Bell era?

It is going to get easier; the decisions will be more obvious; and they can take a reactive role and still do well. Technology is leaping. The decisions are going to get harder and more complex. The hardest problem that a communications manager or computer manager has is understanding

the implications of the technology before the internal users do.

How are large users meeting the challenge of deregulation?
All users who understand this industry are building embryonic [integrated services digital networks]. Some are completely bypassing the Bell System. For example, Citicorp is putting advanced workstations in the hands of their largest users. They are making econometric data bases and information about money available. What's the price of deutsch marks on the world exchange?

They're helping users by integrating publicly available data bases with privately available data bases. They are then going to put on the roof of your building, for your use or shared use, a [digital termination system], avoiding the local operating company. Finally, in the coup de grace, they have two transponders on Westar V. Citicorp is a registered common carrier.

In the companies that anticipated change, was it top management or is it the people in the trenches of communications and DP that goaded their companies into action?
Top management has to be proselytized. In some cases, top management understands, and it is middle management that will become the impediment. Half the speeches we make are made to boards of directors where top management understands the implications of this. They once asked Napoleon who rules France, and his answer was "10,000 file clerks."

What priorities should users establish?
Put your efforts in those areas that will give you an advantage. Federal Express says, "Our business is threatened not by Emory [Worldwide], not by Airborne [Freight Corp.], not by the U.S. Postal Service. It's threatened by IBM, Wang [Laboratories, Inc.], Digital Equipment [Corp.]

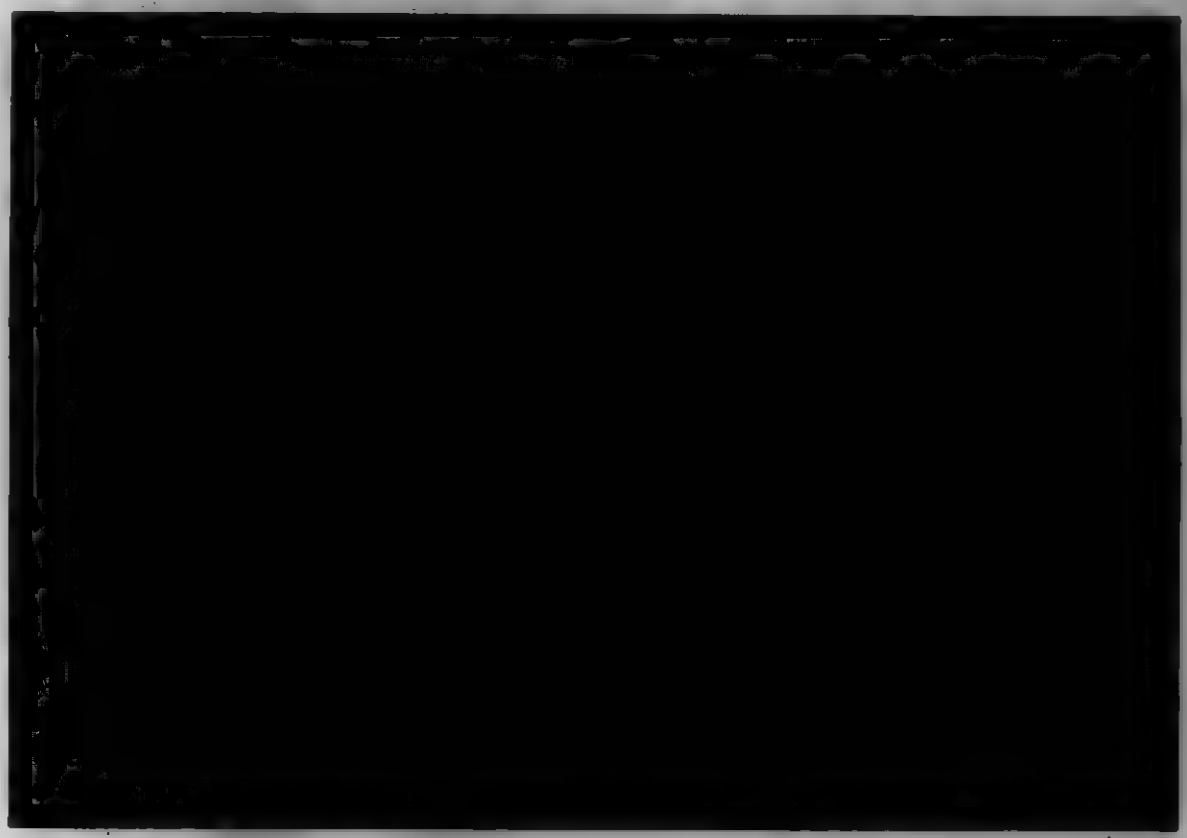
"The user eventually will be able to bypass us because 60% of our small packages, which itself is 60% of our business, are alphanumerics and computer tapes. Therefore, we will devise a system that can avoid our airplanes all together." That is where you put the technology.

Let me throw a new buzzphrase at you: telecommunications enhanced real estate. Does that mean anything to you?
It sure does. Are we going to see high-tech offices? The answer is yes. What is a high-tech office? It is an office that has high-speed data communications built into the walls and into the roof. It probably has 1.5M bits of data on every desk, available to plug in. It has least-cost routing. It has a building that has parts of artificial intelligence built in. It knows when it is hot; it knows when it is cold. It knows when you are not in the room; it does your energy management; it does security.

"Top management has to be proselytized. In some cases, top management understands, and it is middle management that will become the impediment. Half the speeches we make are made to boards of directors where top management understands the implications of this. They once asked Napoleon who rules France, and his answer was '10,000 file clerks.'"

Is the installed base of twisted-pair wiring usable for speeds up to 1M bit or not? If so, is it usable with the kinds of systems we are talking about here?
Yes. Over short distances, twisted-pair will be fine.

How do you view the controversy over access charges?
There is a lot of double-talk about access charges. A Centrex system is a shared PBX. It is a central office PBX. Some say Centrex is no longer viable with the new access charges. Baloney. Two of our clients, Prudential Insurance [Co.] and General Motors [Corp.], share with us the idea that the local operating company would manage to keep their costs under control. Who gets the access charge? The local operating company. If Centrex charges $30 before access charges, and now the access charge comes in at $6, could not



Do you have a data communications network or does it have you?

Why tie up your resources when you can take advantage of ours? And there's never been more reason for taking advantage of RCA Cylix than right now during this period of deregulation and divestiture. Here's why.

Unlike the other guys, we don't just hand you a line. We deliver the stars. Because we're a satellite based, value-added network. Providing end-to-end management and a permanent virtual circuit that's perfect for transaction oriented applications.

What's more, you'll always get our undivided attention. Because data communications is all we do. And since you're working with just one company—not several—you'll never get lost in the shuffle.

RCA Cylix isn't just more convenient. It's also more efficient. Setting up your own network involves a huge commitment of time, personnel and capital funds. Our single vendor simplicity eliminates all that.

One phone call puts our experienced people to work for you. Setting up your network. Handling all those dealings with all those phone companies. And then keeping your network running smoothly thanks to our unique service concept. Plus our design flexibility makes growth easy.

We can do all this more efficiently than you can due to our years of experience. And that can save you money. Because research indicates that personnel, benefits and associated overhead account for up to 1/3 of all networking costs.

Whether you're expanding an existing network or building a new one, how more than ever RCA Cylix is not only the easy choice. But the right one for data networking anywhere in the United States, Canada or Alaska. For more information and our free brochure, "Managing Your Network: Post-Divestiture Costs and Concerns" call our marketing department today at 901-683-3043. Or send in this coupon.

Howard Anderson

that Centrex charge go to $24? What is the net result: $30 to the operating company.

What's in the future for Centrex?
What we need and what we are seeing is the next generation of central offices, the next generation of Centrex, what we call super Centrex. It will probably be done on devices like a DMS 100 from Northern Telecom.

We are telling our largest users now that they do not want a PBX in some cases. They want a central office. If they are going to be their own telephone company, then go all the way, buy a central office. A shared-use central office and a shared PBX are one and the same thing. I can use microwave development to share a PBX here with Sheraton Hotels up the street by putting a little dish on the top of my roof.

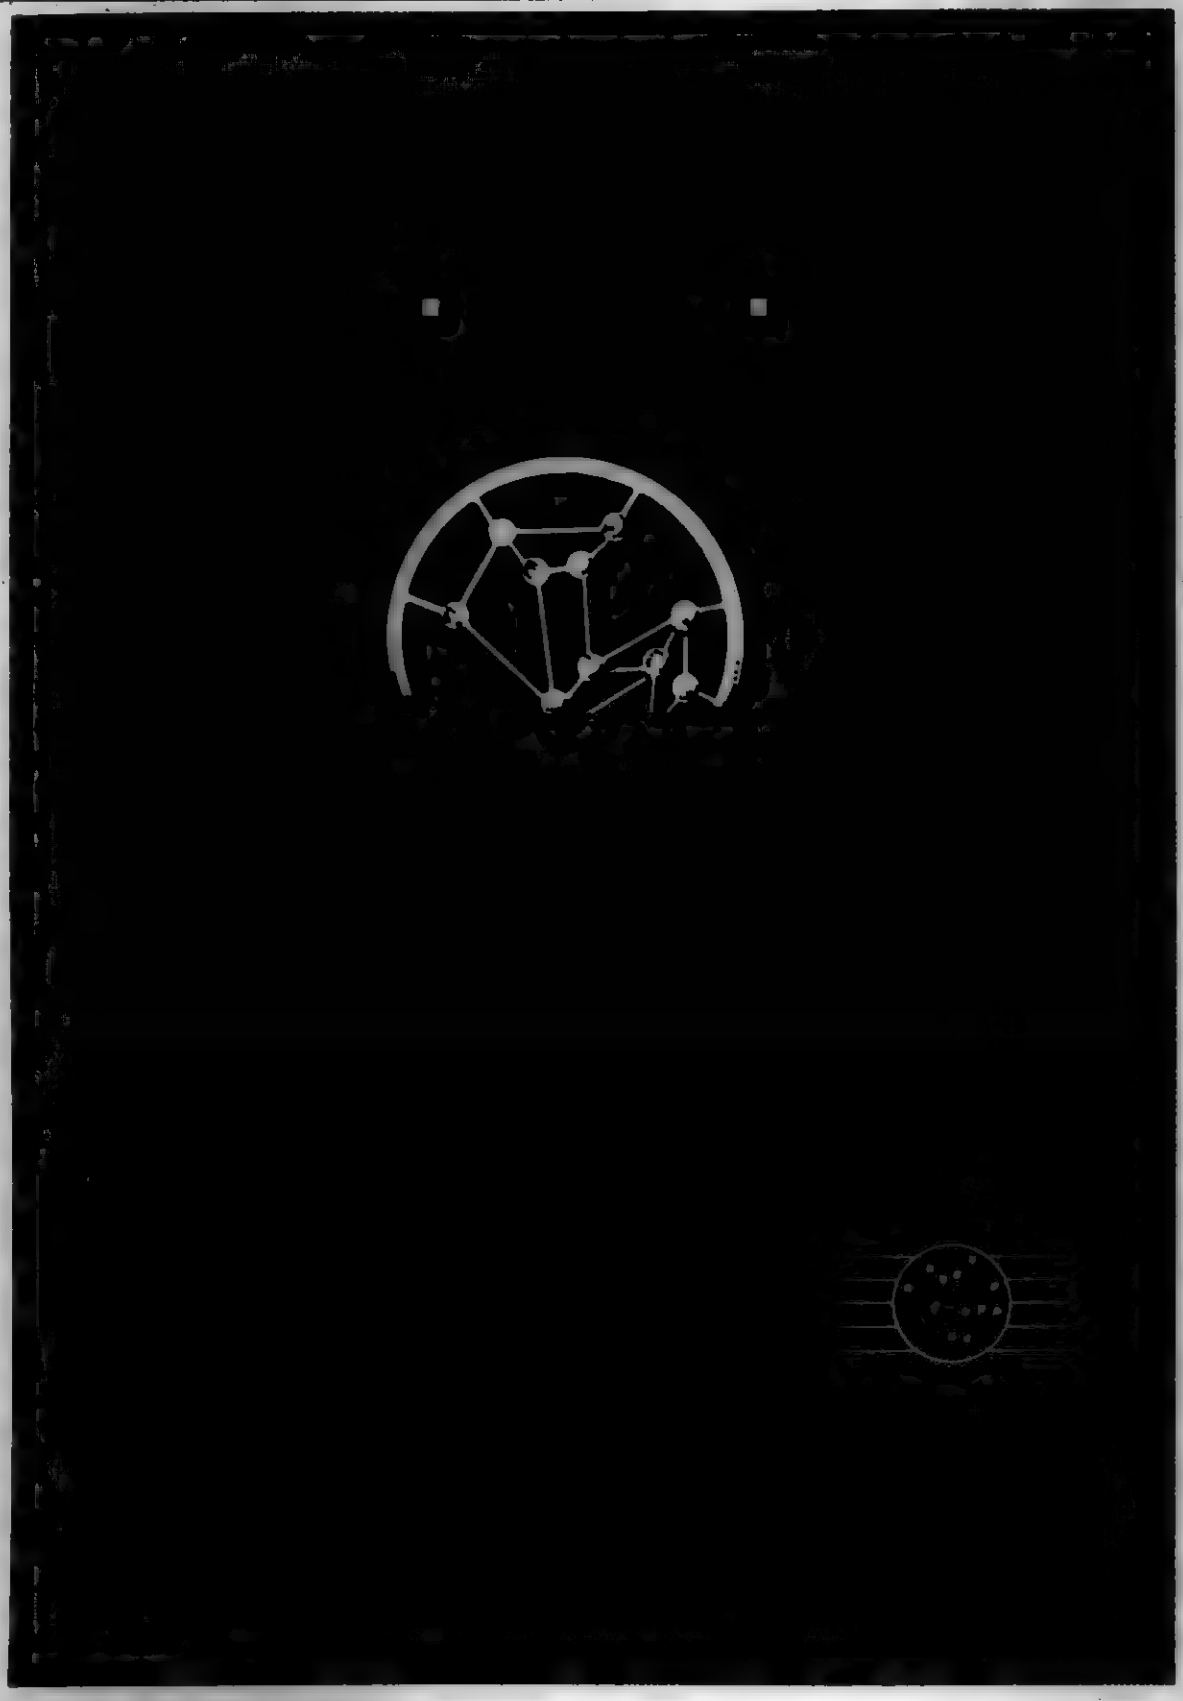
What are the implications of the Supreme Court decision in the Litton [Industries, Inc.] antitrust suit against AT&T? I mean, will costs and liabilities eventually be passed down to the [Bell operating companies] if the other 50 pending cases go the same way as Litton's? Is this a tempest in a teapot?
It is a real concern. That money will eventually be paid by every homeowner and every business in America.

Even if nobody else wins, if Litton is the only successful litigant?
The rules of monopolistic practice are vague enough so that if a judge or jury is convinced one side is truly wrong, he can award that way.

And one case going to completion is almost a priori evidence that others stand a chance of succeeding.

What do people think of Howard Anderson?
Hopefully what they think is, original thinker, occasionally arrogant.

When?
When arrogant? In that the goal of the Yankee Group — and I've never made any bones about this — is easily world domination. We want to be the most important company in our industry. We want the vendors to build the systems that we think the market will want.



"The goal of the Yankee Group — and I've never made any bones about this — is easily world domination. We want to be the most important company in our industry. We want users to buy systems that will be forward processing."

We want the users to buy systems that will be forward processing, that will forgive without penalty.

I think I am regarded as a good, occasionally exceptional speaker. I think the company is representative of both my strengths and weaknesses.

Your weaknesses being?
Oh, sometimes a tendency to go right to the conclusion without building every logical step. The tendency to want to lead the industry as opposed to follow the industry.

What kind of crowd turns you on when you're speaking?
The smarter the better.

How can you tell a smart crowd?
They laugh at the right time. ■

WESTINGHOUSE'S MICROWAVE MARVEL

BY KATHERINE HAFNER

PITTSBURGH, Pa. — Pittsburgh is filled with surprises these days. The city Charles Dickens once described as "that ugly confusion of backs of buildings" is enjoying a reincarnation as a cultural and corporate mecca, attracting enough diverse talent to rival the haughtiest of metropolises.

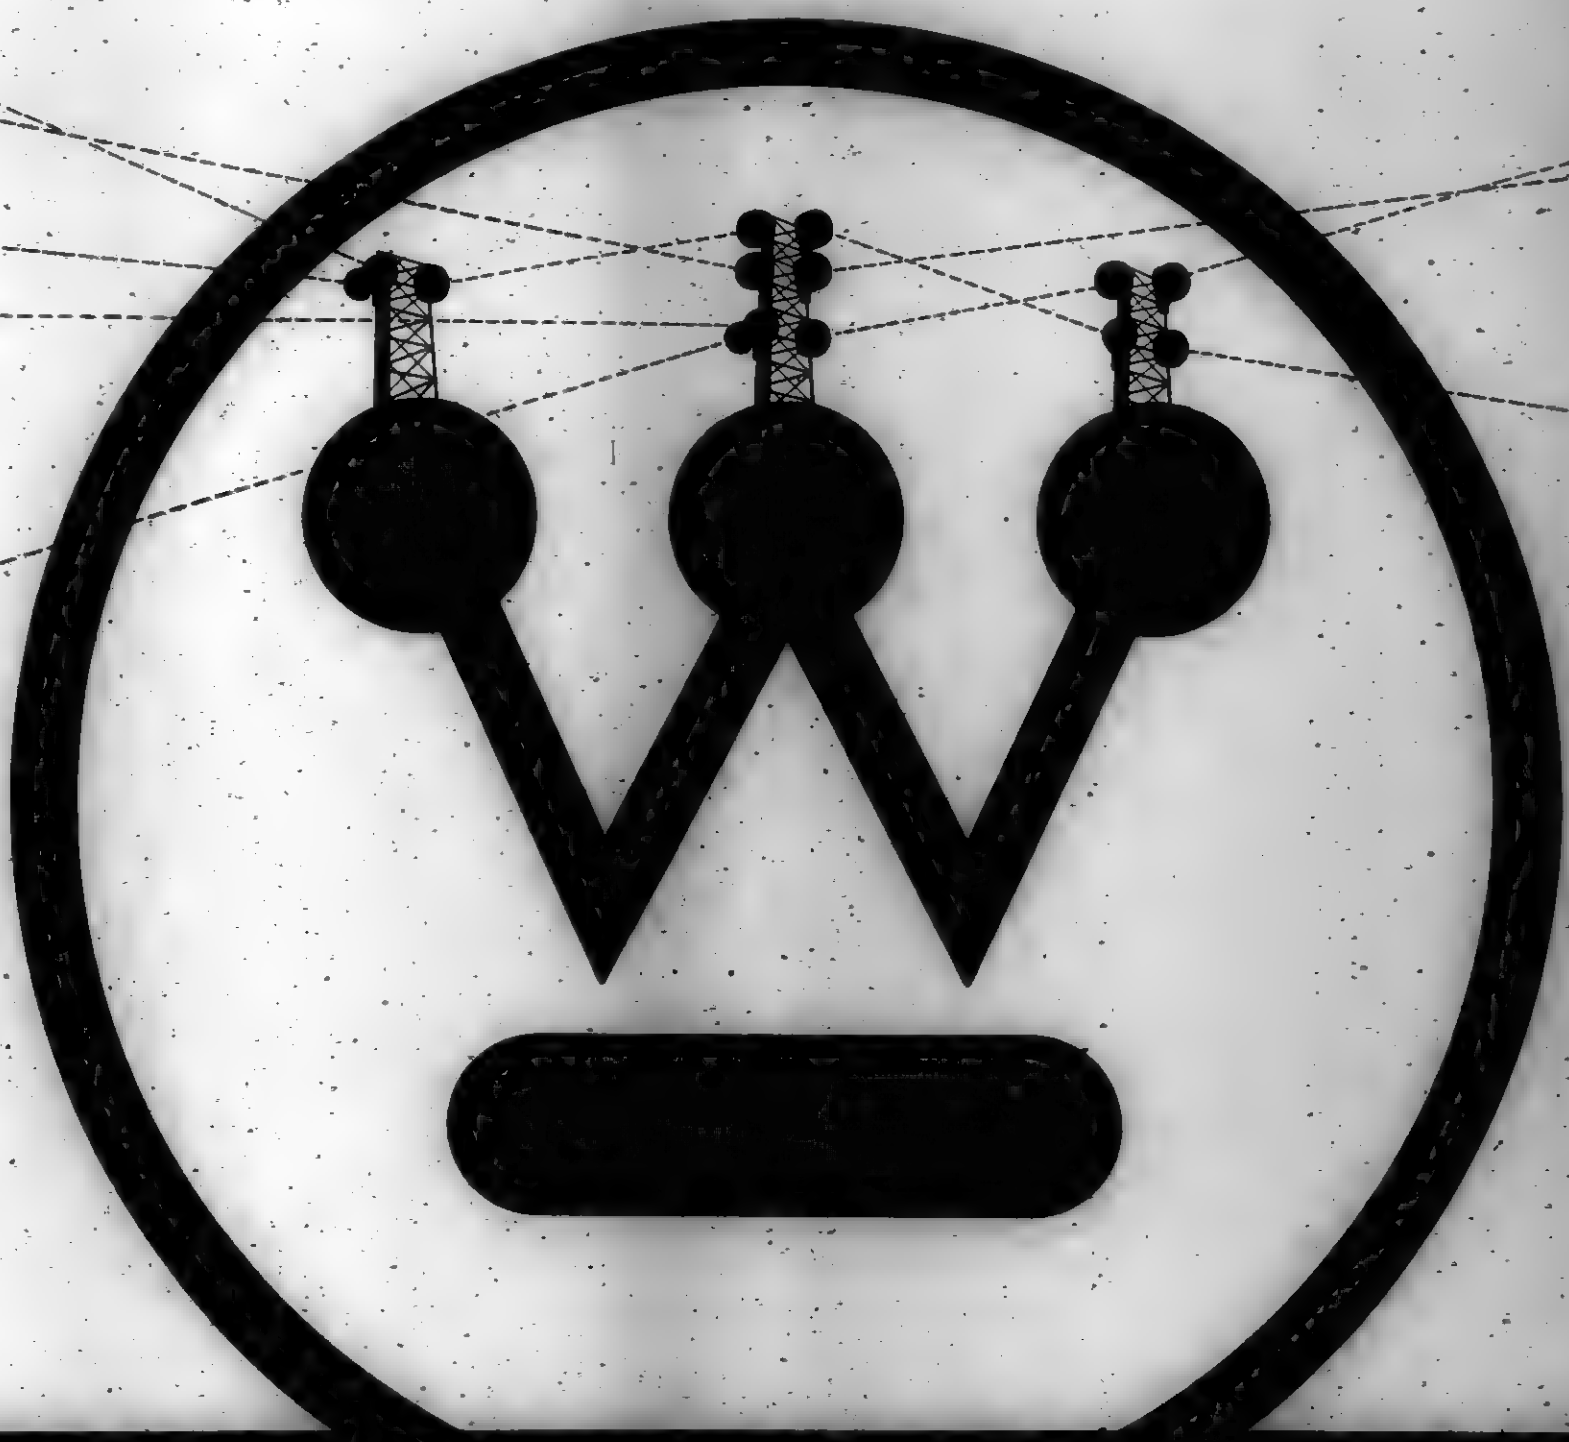
In fact, Pittsburgh is the nation's third largest center for corporate headquarters. And not least among the occupants is Westinghouse Electric Corp., the industrial conglomerate whose commitment to the Pittsburgh metropolitan area has traditionally run wide and deep.

Hafner is staff writer for On Communications.

In the past few years, however, Westinghouse has literally passed over its locale by installing a private digital microwave communications network that blankets the metropolitan Pittsburgh area. This network deprives Bell of Pennsylvania of $500,000 to $1 million a year in transmission revenues and equipment rentals. According to Westinghouse's own projections, the private network will produce some $66 million in savings over a 10-year period.

Spanning a 20-mile radius, the $26-million Westinghouse Digital Information Network (Wesdin) serves 15,000 Westinghouse employees, primarily for voice communications. With the network in place, Westinghouse has managed to bypass the local operating company almost completely, according to Robert Bennis, Westinghouse's communications systems manager.

Barring the passage of costly tariff legislation, the private setup is expected to pay for itself by 1988. Bennis frowns on pending legislation that would place a surcharge on those who bypass local operating companies. While he has not yet calculated the cost of operating the network if the ▶



bypass legislation becomes law, Bennis is not encouraged by his initial estimates.

"It sounds like they want to penalize bypassers to a point where it would be economically unattractive to bypass and sock you for more than it would cost you to have a private system," Bennis said. He considers the bypass bill a "misguided" piece of legislation. "I don't think it is necessary. Given the nature of the divestiture process and the effort the [Federal Communications Commission] has made to address the kinds of concerns that the bill supposedly addresses, I think it is counter-productive."

The headquarters for telecommunications at Westinghouse are as inconspicuous as Wesdin's radio towers are imposing. The telecommunications division is tucked between Frank's Jewelry and Ardmore Beauty Supplies in the shopping center 10 miles east of Pittsburgh.

Wesdin, often cited as the most advanced and technologically innovative network of its kind, was not so much the result of tremendous technological foresight as necessity.

The headquarters for telecommunications at Westinghouse are as inconspicuous as Wesdin's radio towers for transmitting and receiving signals are imposing. The telecommunications division is tucked between Frank's Jewelry and Ardmore Beauty Supplies in the Forest Hills shopping center 10 miles east of Pittsburgh. It is there that Bennis, his engineers and managers implemented the private communications system for Westinghouse, which four years ago anticipated concerns that would crop up as a result of AT&T's divestiture in 1984.

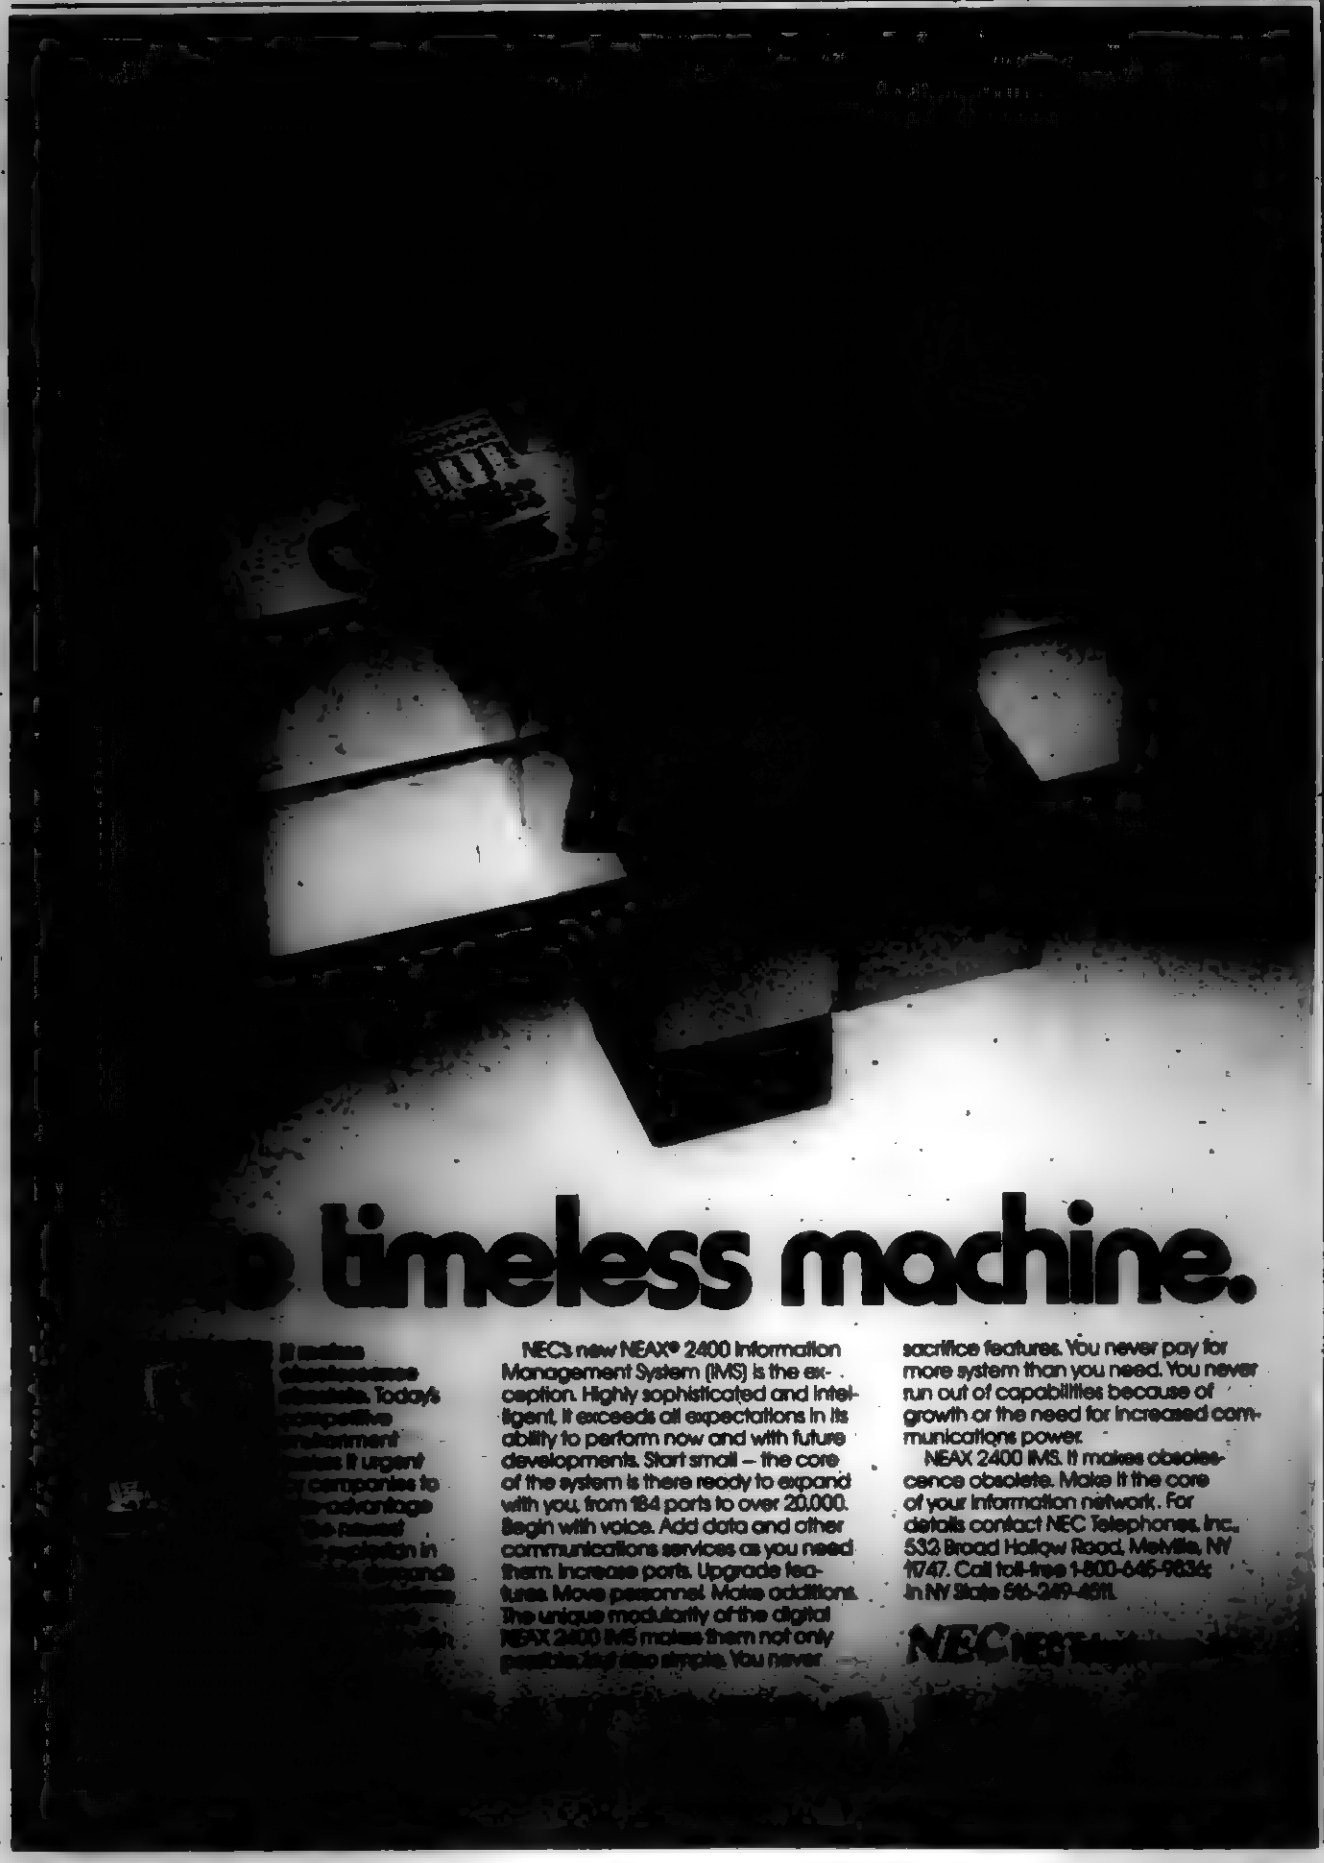
According to Bennis, communications staff members at Westinghouse began to think seriously about installing its network when the Centrex service that had been in place for 15 years first headed for obsolescence. Bell of Pennsylvania notified Westinghouse that the local telephone company was considering the termination of its Centrex offering and planned to file with the local utilities commission for a substantial rate increase.

"Their original indications were that they would phase out Centrex and encourage users to install the new Dimension [private branch exchange] system," Bennis said. "We didn't want to be forced to have one option of either seeing Centrex gradually phased out or become prohibitively costly, with the only alternative being to pull Centrex out and replace it completely with a Dimension system. We didn't feel that was the only alternative that should have been made available."

So with plenty of lead time, Bennis and his group then began to evaluate different ideas for a private network. The only strict criterion, according to Bennis, was that the network be digitally based and that it employ "technology of the future."

Bennis explained, "If we were going to make a change of this type, we wanted to go with a technically superior kind of system."

So Westinghouse, whose total communications expenses reach as much as $100 million per year, went shopping for a private voice and data communications network



that would bypass Bell of Pennsylvania and integrate such office automation capabilities as facsimile transmission and eventually video transmission.

"We gave vendors one page of specifications with 13 items on it," William Hunkele, operations manager at Westinghouse, said. The chief system requirements included all-digital facilities, touch-tone dialing, centralized operators, least-cost routing and transmission capabilities up to 56K bit/sec.

After a lengthy and thorough evaluation of each vendor, the contenders for the project were narrowed down to Bell of Pennsylvania, General Dynamics Communications Co. and GTE Business Communications Systems, Inc.

"Bell of Pennsylvania finally withdrew on the basis that it didn't have the kind of capability we were asking for in the time frame we wanted it," Bennis said. "We wanted to begin installation in the early part of 1981. So that left General Dynamics and GTE. We finally selected GTE primarily on the basis of price, technical capabilities of the proposal and the kind of project management capability they demonstrated."

INSTALLATION OF THE GTE system began on schedule in February, and the last node was in place "on schedule and within the budget" in December 1983, Bennis said. Westinghouse employees and machines communicate with one another through a series of GTD PBXs. The "hub and spoke" configuration of Wesdin revolves around three major tandem switches, incorporating six GTD 4600 PBXs, which handle up to 10,000 lines, 12 GTD 1000 PBXs, carrying up to 1,000 lines, and two GTD 120 PBXs. The end-to-end digital network connects 23 locations, either with digital microwave links operating on an industrial bandwidth at 2-, 12- and 18 GHz, with the bulk of the traffic on the 12 GHz channels, or with coaxial cable.

The PBXs themselves provide dial-up switching capability, along with synchronous data speeds reaching 56K bit/sec. Utilizing the digital transmission facilities, dedicated data circuits provide host-to-host and terminal-to-host transmission capabilities.

The hub of the network is Westinghouse's Network Control Center, about two miles up the hill from the telecommunications office. The status of the system is tracked at the control center, and corporate telecommunications data is gathered and processed by a Digital Equipment Corp. PDP 11/70 16-bit minicomputer. In a room with a wall-sized map of the U.S. covered with blue and red blinking lights, control operators monitor Westinghouse's nationwide communications network of 4,500 circuits at 1,000 locations, as well as the local Wesdin.

Bennis said that in his 19 years at Westinghouse, Wesdin is the most technologically advanced project he has been involved with and is "certainly the largest in terms of cost and magnitude."

The only hindrance to the completion of the network, Bennis noted, was community opposition to the building of a radio tower that would have changed the complexion of a local residential area.

"Putting those towers up was sort of an emotional thing for some of the residents in the towns where they would go," Bennis said. "We had originally planned to put a 110-foot tower on property owned by Westinghouse, and the town withdrew its initial approval. So we had to go look for another site."

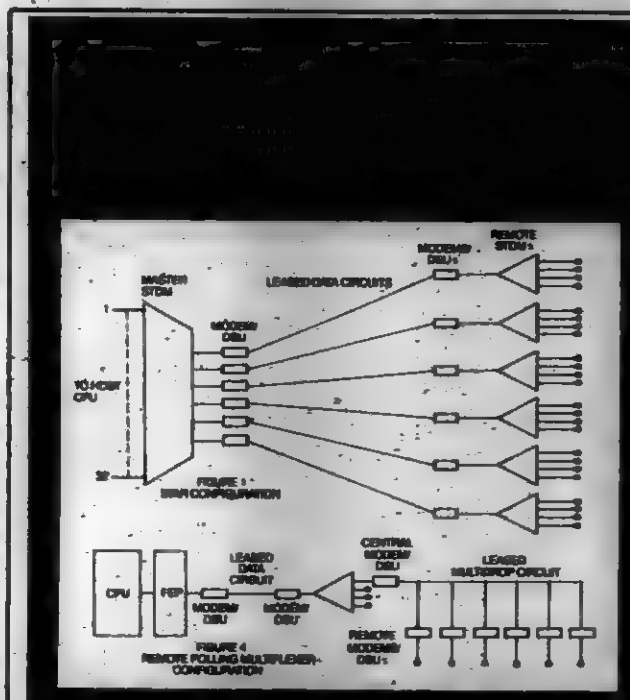
Westinghouse uses four radio towers for the network, two of which the company constructed itself. The highest of the towers stands 250 feet tall, looming over the eastern section of the metropolitan area, with seven receiving dishes hanging off its sides.

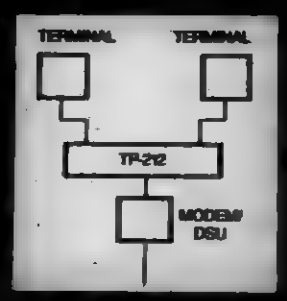
According to Bennis, Wesdin is completely transparent to the end users, most of whom use the system for voice communications, which makes up the bulk of the transmission over the network, leaving only 8% to 12% to data traffic. An even smaller percentage of the network traffic is devoted to facsimile and fast-freeze video transmission, which are still in the experimental stages, Bennis said.

Aside from a few additional "software glitches that gave us heartburn for 24 hours" and some "technical crises," the installation of the system went smoothly, Bennis said.

The system was phased in gradually; the first large system was constructed in east Pittsburgh, where the Tele-Computer center, or the control point for the rest of the network, originated. Additional nodes to the system were gradually installed, and it was not until the spring of 1983 that the microwave portion of the system became operational. As of now, the network is 95% complete.

Westinghouse recently built a second private microwave network in Puerto Rico, where the company operates 30 assembly plants. The analog microwave network in Puerto Rico was installed





in the last two years for accommodation of "fairly significant communications between the Puerto Rico plants and their parent plant in the U.S.," Bennis said. "The existing network had unreliable facilities and problems brought about by storms and water seepage. After many years of struggling to communicate, we decided to put in our own system."

Bennis is also quick to note that Westinghouse does not have a total bypass system. "Some of our locations are using Bell facilities, and all our backup lines are through Bell," Bennis explained. "So this is not 100% private microwave. It is actually evolving into a hybrid system."

While more than 90% of the Pittsburgh system operates on digital microwave, Bennis said that Bell of Pennsylsvania, now competitive as a subsidiary of Bell Atlantic, is negotiating with Westinghouse to provide the company with a fiber-optic system. This system would would augment existing facilities.

Bennis explained, "1984 is a big transition year with a lot of churning and confusion and juggling around of tariffs and rates and everybody trying to get part of the turf. But once we get over the transition and the enormous amount of misconception that's been generated by this thing, it will be interesting. The innovative possibilities will begin to surface even more than they have in the past."

"Since we have gone the microwave route, Bell of Pennsylvania has become very interested in joining with us in the development of the network," Bennis said.

"They have been proposing that we add more locations to the original Wesdin project. Rather than put in another microwave link, they'd like us to consider putting in fiber-optic capability," he explained.

"I think that looks like a very viable alternative. Fiber optics is hard-wired so we wouldn't have to be as concerned about security as we are with the radio system. And I don't have to invest capital dollars. I can consider an operating lease."

And as a result of the AT&T divestiture, Bell of Pennsylvania is now ready to compete for Westinghouse's business. "We view Westinghouse as a very important customer," Jack Patterson, marketing manager for Bell of Pennsylvania, said.

For its long-haul links, Westinghouse relies on AT&T's Enhanced Private Switch Communication Service, a standard private network package AT&T provides to two dozen private corporations. The company also maintains a companywide electronic mail system, which connects 28 foreign countries with Westinghouse offices.

Westinghouse is served by a variety of suppliers, each of which meets a different communications requirement for the company. In addition to AT&T, the company subscribes to both MCI Communications Corp. and GTE Sprint for long-distance services. Bennis said the telephone systems come from "all the major suppliers," including Rolm Corp., Northern Telecom, Inc., Hitachi Ltd. and Stromberg-Carlson.

In addition, the electronic mail service is provided by ITT Dial-Com, and Westinghouse also uses the packet-switching services of GTE Telenet, Inc. and Tymnet, Inc.

"As you can see, we've been in the business of dealing with non-Bell suppliers since the mid-'70s," Bennis pointed out. "I even think we were MCI's second customer."

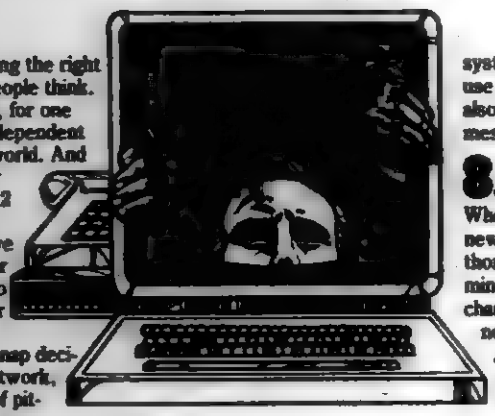
Bennis believes the future growth of the network depends largely on whatever happens to the telecommunications industry as a whole in coming months.

He explained, "1984 is a big transition year with a lot of churning and confusion and juggling around of tariffs and rates and everybody trying to get part of the turf. But once we get over the transition and the enormous amount of misconception that's been generated by this thing, it will be pretty interesting.

"The innovative possibilities will begin to surface even more than they have in the past," Bennis added.

"And I think that as the user, we're going to have a pretty full plate to choose from." ■

10 PITFALLS TO AVOID IN CHOOSING A PUBLIC NETWORK.



There's more to selecting the right public network than most people think.

How do we know? Well, for one thing, ADP is the largest independent computing company in the world. And when we built Autonet—our public data network—over 12 years ago, we did it right.

For another thing, we've listened very carefully to our clients. Especially those who have come to us from other networks.

So before you make a snap decision about a value-added network, why not look over this list of pitfalls? It just might save you some expensive mistakes.

1. Going Beyond the Outage Limits
Don't risk losing time and money to equipment outages. Every network's goal should be 100% uptime. If your network doesn't achieve at least 99.5% service availability, you don't need it.

2. The Low-Density Low Blow
Chances are, if your remote locations are really remote, you may have to pay more than you should. Other networks charge as much as $5 per hour extra for access from second or third tier cities. So be sure to compare their price schedules with your geographic distribution.

3. Personal Attention
You're going to want a lot of one-on-one support to help you control costs and increase efficiency as usage grows. Be sure you get it. Demand detailed usage summaries, customized if necessary. And make sure client support is part of the service agreement.

4. The More-Is-Better Myth
Many networks emphasize size over accessibility. So remember this: it doesn't matter how *many* access locations a network has. What matters is how many of them are where you need them to be. Make sure you're covered.

5. Back-Up at Black Market Prices
Don't pay double for redundancy. Make sure your network provides back-up host circuits that are effective, transparent and—above all—economical.

6. Future Shock
Can the network meet your future needs? Videotex and electronic mail included? Be sure you'll be able to get the services you need. Without going to another vendor or playing guinea pig to unproven technology.

7. Out-of-Date Updates
Does the network have a free on-line directory designed to keep you current on new services and access information? Ideally, that system should be interactive, easy to use and updated regularly. It should also give you a fast way to send messages to network headquarters.

8. The Great Software Experiment
When your network rolls out new software, be certain it's been thoroughly pre-tested on a pilot or mini-network. Never accept major changes in your software as part of a normal host interface arrangement. And never, never choose a network that schedules downtime when it will disrupt your service.

9. Troublesome Troubleshooting
"Fast response time" should also apply to service. You have every right to expect standardized "trouble ticket" reporting and tracking. And your network should be willing to call on top management to solve your problems, if that's what it takes.

10. Terminal Tomfoolery
When you invest in costly equipment, it should meet your needs — not someone else's shortcomings. Insist on optional functions for such things as special character handling, speed, page width and other terminal features.

Now that you know some of the problems involved in choosing a public network, how do you go about avoiding them? You start by sending for our free information booklet, "Going Public: The ADP Guide to Value-Added Networks." Call or write for your copy today.

Special Section: Local-Area Networks

AFTER THE STORM

As general manager and vice-president of Xerox Corp.'s Office Products Division between 1979 and 1982, David Liddle was on the front lines of the Great Local-Area Network Battle. The battle pitted Ethernet, Xerox's innovative baseband local net that was introduced in 1981, against the rest of the communications world. The primary battleground was the trade press. Although Xerox fired the first salvo with its widely covered Ethernet introduction, it wasn't long before the company — whose forces were marshaled by Liddle — found itself under heavy attack from all sides. And the attacks were dutifully reported in the newspapers and magazines covering the communications scene.
